# Performance Information in Evidence-Based Management

Liang Ma
School of Public Administration and Policy, Renmin University of China, Beijing, China

## Synonyms

Evidence-based policy-making; Evidence-informed decision-making; Organizational performance; Performance information use; Performance management; Performance measurement; Policy learning; Policy-based evidence; Program evaluation; Randomized controlled trials (RCTs)

## Definition

Performance information in evidence-based management refers to the purposeful and systematic use of scientific and/or qualitative evidence about organizational and program performance in managerial and policy decision-making in order to design and implement evidence-based policies and to improve organizational and program performance.

## Introduction

The traditional and stereotyped view of management in public organizations is that it is primarily an art or craft difficult to explicitly elaborate and learn. In this conceptualization of public management, managers use their own personal experience and judgments to make decisions critical to organizational survival and success. They may also pay attention to management practices adopted in their peer organizations or advocated by consultancy firms, but such information is usually not routinized or systematically used. In other words, public managers mainly base their decision-making on personal experience and anecdotes, which makes policies largely depend on managerial experience and vulnerable to disruptions and failures.

Such traditional approach of public management is still the predominant style of policy decision-making in contemporary governments around the world, but the systematic use of evidence, and specifically performance information, in policy decision-making has been burgeoning over the past decades. The new form of policy decision is usually called evidence-based policy (EBP), and it is also referred to as evidence-based management (EBM) in public organizations, depending on the nature of the decisions to be made.

Both EBP and EBM are inspired by evidence-based medicine (EBMd), which means the use of latest scientific evidence from clinic tests and systematic reviews, together with the willingness and preferences of patients, in doctors' clinic and prescriptive decision-making. Before the idea of EBMd was introduced in the 1980s, doctors often rely on their outdated knowledge accumulated from their own clinic experiences and decades-ago medical training, while the latest developments of scientific research and pharmaceutical innovations are not incorporated into their prescriptive decision-making. With the availability of new evidence, something worked in the past might not work now, or vice versa. EBMd prompts doctors to systematically refer to most recent scientific evidence on the diagnoses of specific diseases and the effectiveness of corresponding treatments when they make clinic decisions. Doctors' personal training and clinic experience are still important, but they are complementary (and sometimes competing) evidences supporting decision-making.

EBP and EBM use exactly the same logic of EBMd to transform public policy and

management practices to improve public policy and service performance. By asking public managers to pay attention to and incorporate evidence in their decision-making, public policies and management practices can be more efficient and effective. The types of evidence used in public policy and management are different from medicine, which often relies on randomized controlled trials (RCTs) as the gold standard of clinic treatments. RCTs are experimental studies to compare the differences between the treatment group (for instance, ask patients to take medicines) and the control group (patients without treatment) before and after the treatment, which helps to infer the causal effects of the treatment on patients' recovery. In contrast, public policy and management studies usually rely on case studies and observational studies (e.g., survey, interviewing) instead of RCTs to accumulate evidence, and the validity and reliability of the evidence are largely limited.

Given that most evidence is about organizational and program performance, performance information is usually used an exchangeable term with evidence in EBM. For instance, one policy instrument is found by many scientific studies to be effective in achieving one management purpose, and public managers can make an evidence-based decision to introduce this policy instrument into their organizations or programs. Performance information in evidence-based management refers to the purposeful and systematic use of scientific and/or qualitative evidence about organizational and program performance in managerial and policy decision-making in order to design and implement evidence-based policies and to improve organizational and program performance.

EBM helps to narrow and eliminate the lingering gap between management knowledge and actions, which means that management studies have accumulated lots of evidence, but managers seldom use them in organizational practices (Pfeffer and Sutton 2006). In the contexts of public organizations, which are often subject to political control of multiple external stakeholders, EBP helps to make policy decisions based on solid evidence instead of partisan politics. There are notable tensions between EBP and EBM, because they have different standings about what could be counted as evidence, how to communicate evidence, how to judge the rigor and validity of evidence, and how to balance scientific decision-making and democratic accountability (Heinrich, 2007). To simplify the interpretation of EBP and EBM, we highlight their similarities and linkages instead probing into their differences and tensions.

## The Types and Validity of Performance Information

The evidence used in EBMd is primarily generated from RTCs, which is believed to be the gold standard of scientific evidence. RTCs and other experimental designs help to generate causal effects of treatments, interventions, or manipulations on organizational and program performance by establishing the counterfactual to which their effects can be accurately estimated. The counterfactual means a scenario in which the treatments would not happen (the control group), which is compared with the scenario when the treatments happened (the treatment group) to estimate treatment effects. In contrast, observational studies (e.g., case study, survey) can only estimate the relationship between the treatments and the outcomes, but we cannot infer if the relationship is causal or not.

In comparison with RCTs ubiquitously used in EBMd, the majority of evidences used in EBM and EBP are from observational studies. It is usually difficult to implement RCTs in the contexts of public policy and management, which are subject to insurmountable ethnic and political challenges. Even experiments can be designed, they are either run in the labs or implemented in the form of survey experiment. Meanwhile, natural and quasi-experiments are also used to generate usable evidences, but their validity is largely limited. However, they are equivalently (if not more) valuable in improving the quality of decision-making.

We should acknowledge that evidences vary in terms of quality, relevance, validity, and reliability, but they all contribute to some extent to the

improvement of decision-making quality. Performance is a multidimensional construct about the processes and outcomes of organizations and programs, and evidences might only capture some dimensions. Performance can be examined from many aspects of organizations and programs, e.g., inputs, activities, outputs, and outcomes. Also, performance can be assessed from different dimensions of economy, efficiency, effectiveness, and equity (van Dooren, Bouckaert, & Halligan, 2015).

Apart from quantitative and objective indicators, performance can also be evaluated by perceptions of citizens and other stakeholders. Objective performance indicators are often believed to be more reliable than subjective perceptions, but the latter is usually more relevant to democratic values. Performance information can also be nonroutinized and informal feedbacks from the clients and other stakeholders of public organizations, which are also relevant to managerial decision-making (Kroll, 2013). We should acknowledge and even celebrate the diversity and complexities of performance information generated and used by public organizations, which give public managers more leeway to benefit from EBM and EBP.

## The Link between Performance Information and Evidence-Based Management

The use of performance information in decision-making can take many forms, and they are also driven by different factors. Performance information can be used to allocate budget, to arrange programs, to incentivize staff, to improve performance, to learn from the past and peers, to celebrate achievements, to claim political support, to justify legitimacy, and so forth (van Dooren et al., 2015). Generally speaking, performance information can be used for internal/rational and external/political purposes. The use of performance information can be either purposeful or political. Internal use is mainly purposeful and instrumental to learn, to incentivize, and to improve performance, while external use is often to claim political legitimacy and support from the circumstance.

To understand why performance information is (or is not) used by public managers is the big question of performance management (Moynihan & Pandey, 2010). Many environmental, organizational, and individual factors affect the use of performance information in managerial decision-making (Kroll, 2015). For instance, organizational culture plays a pivotal role in prompting managerial use of performance information, and developmental culture rewarding innovations and learning can boost EBM. The maturity of performance management system, as well as the availability and quality of performance information, are also crucial to performance information use.

The rise of behavioral economics contributes substantially to the use of EBP and EBM, because behavioral sciences generate lots of evidences relevant to managerial and policy interventions. Particularly the use of "nudging" in changing people's behaviors to achieve policy purposes has significantly raised the political support of EBP and EBM (Halpern, 2015). By manipulating the default options of organ donation, changing the colors of tax bills, socializing the messages sent to voters, and simplifying the procedures of unemployment training, among others, nudging generates tremendous policy outcomes that otherwise cannot be achieved. Many countries and cities have developed policy labs to experiment and communicate these evidences generated from behavioral sciences in policy design and implementation.

In the field of public administration, behavioral public administration has also been advocated to be one of the future directions (Grimmelikhuijsen, Jilke, Olsen, & Tummers, 2017). Public administration researchers are encouraged to learn from and work together with psychologists to do experimental studies, which generate workable and solid evidences to inform and support managerial decision-making. By doing so, the link between performance information and evidence-based management has been substantially strengthened. Public managers have been increasingly using performance information in their decision-making, which is quite different from their traditional approach of art- or craft-based management.

## Evidence-Based Policy or Policy-Based Evidence?

EBM and EBP are the rational interpretation of decision-making, but there is also political elaboration of decision-making. Policy and managerial decision-making is always a process of political bargaining involving lobbying, exchange, coalition, and advocacy among stakeholders and interest groups. In comparison with these bargaining players, evidence or performance information seems thin and fragile. Furthermore, performance information can even be interpreted and distorted to serve political purposes.

There are many reasons why performance information is not used or misused in decision-making. First, many sources of performance information can be incongruent and even conflicting among each other, making public managers irresolute in making decisions. Performance measurement helps to eliminate the lack of performance information, but it also generates performance information bubble with the help of information and communication technologies. For instance, objective and subjective performance information may generate different and even conflicting conclusions about policy options, and public managers can use one but ignore the other.

Second, performance information may be subject to political manipulations. Given that scientific research is often with caveats and of uncertainties, scientific evidences are often manipulated to serve political purposes. For instance, thousands of scientific studies have confirmed that global warming is primarily due to human beings' activities, but there are also competing theories and evidences supporting the opposite. Politicians are keen on picking and leveraging these favorable evidences to support their decision-making, which distorts EBP to be policy-based evidence (Cairney, 2016).

Finally, democratic procedures blur the boundary between evidence and policy, making evidence irrelevant to decision-making. The general public and their political representatives usually lack essential policy knowledge, and their decisions are often misdirected by fake news and politicalized fabrication of evidences. It is especially obvious in many controversial policy domains (e.g., climate change, genetically modified food, nuclear power), in which evidence-based policy-making is hardly a truth.

Evidence is not totally value-neutral, and the researchers may also incorporate their partisan and ideological preferences into evidences. If EBP is overemphasized as the gold standard of decision-making, then biased evidences may undermine democratic values. Also, the utilization of evidence is multifaceted, and it is naïve to assume that evidence should be directly and fully used in decision-making (Weiss, 1979). Realistic practitioners recommend evidence-informed decision-making to replace EBM and EBP, because evidence is just one information source of decision-making. The evidence helps to clarify the situations, educate the public, and provide workable solutions, and it is public managers to use performance information to make policy and managerial decisions. By incorporating performance information and citizen inputs into policy and managerial decision-making, evidence-informed management can simultaneously improve public service performance and strengthen democratic values.

## Conclusion

Performance management and EBP are highly interrelated in using evidence or performance information in decision-making, and public policy and organizational management benefit tremulously from generating and incorporating evidence or performance information in decision-making. Performance information is not limited to scientific evidence generated from RTCs, but also includes many other types of "evidences" relevant to policy and managerial decision-making. EBP may be used by politicians for their political purposes, which results in policy-based evidence. Similar to the idea of EBMd, performance information should be used as one of the inputs to support policy and managerial decision-making, and citizen engagement and democratic values also matter. Public managers and policy-makers should use evidence-informed decision-making by incorporating many types

of evidence and public opinions in making scientifically rigorous and democratically acceptable decisions. It is of particular value for future research to explore under what conditions and by which means EBP and EBM can be fostered and sustained.

## Synonyms

Disciplined spending; Estimates; Performance data; Primary; Results-oriented measures; Severity

## Definition

Performance information is data obtained from the performance cycle in the form of hard or soft data through annual reporting. There are two types of performance information. First, performance information resulting from internal business processes, which is used for administrative purposes such as human resource management bundles. Second, performance information obtained through financial reporting or program-based information concerning how financial resources are used for projects and plans in a fiscal year.

Austerity refers to the use of disciplined fiscal measures to manage public expenditure in a severe economic recession or budgeting constraints due to limited resources and revenue for public spending. Austerity also refers to disciplined measures to control government spending to ensure macroeconomic stability.

Outcome-based measures refer to the use of precise performance targets or key performance indicators, which can be measured, thus what and how goals are supposed to be a measure to ensure that the stated goals and the mission of the organization hang together and are quantifiable.

Budget priorities refer to the primary list of the activities in a budget in order of their importance. Budget priorities are specific objectives used to allocate public resources efficiently and effectively to achieve government targets for a particular fiscal year.

## Introduction

Public expenditure management is one of the pillars of government efficiency (Leruth and Paul 2006). Also, under austerities, budget cuts are mostly an option for many economies. Hence, outcome-based measures are used for management during these extreme periods. Additionally, performance information is used under "high fiscal" austerity, while "low fiscal" austerity performance information is minimally used (Bjørnholt et al. 2016). The use of outcome-based measures to set budget priorities in the public sector has greater stakes, yet evidence on its effectiveness is mixed (Ammons and Rivenbark 2008; Melkers and Willoughby 2005; Yang and Hsieh 2007). Several studies provide evidence that supports outcome-based measures to be effective in achieving government policy and programs during fiscal stress (Bischoff and Blaeschke 2016; Heckman et al. 2011). These studies generally provide positive evidence on the use of outcome-based measures to be one of the fundamental factors that can improve government performance. However, others believe that most public institutions are unable to develop valid and precise outcome-based measures because some complex goals are difficult to count (Behn 2003; Choong 2013; Radin 2006). The remainder of the entry discusses performance information, performance measurement, and related themes.

## Performance Information: The Principal Agent Theory

Performance information is theoretically linked to agency theory. According to the agency theory, the principal is the person who owns the firm, while agents manage the business of the firm on behalf of the principal. These two parties reside under one firm but have different and opposite goals and interests, so there exists a conflict, and this conflict is termed as the agency problem. Arthur and Busenita (2003, p. 145) likened agency theory to stewardship theory and argue that the two theories focus on goal alignment between the principal which is identified as the Venture Capitalist (VC) and the steward, the entrepreneur. However, this relationship often leads to what Panda and Leepa (2017, p. 74) describe as "conflict of interest and agency cost due to the separation of ownership from control, different risk preferences, information asymmetry, and moral hazards."

The agency theory cannot be discussed without the principal-agent problem. Leruth and Paul (2006, p. 1) assert that "the agency problem arises from the diverging interests." Also, Panda and Leepa (2017, p. 75) opine that the problem is associated with the rise of the joint-stock companies and that the problem has been around for quite a long time. Arthur and Busenita (2003, p. 145) similarly maintain that an agency problem can arise between the entrepreneur (agent) and VC (principal) as a result of incongruent goals and potentially different risk preferences.

The presence of the agency problem in firms is not new. Adam Smith forecasted in his work *The Wealth of Nations* that if an organization is managed by a person or group of persons who are not the real owners, then there is a chance that they may not work for the owners' benefit (Panda and Leepa 2017, p. 75). Besides, the dynamic ownership arrangements surrounding the venture capitalist-entrepreneur (VCE) relationship inherent in new ventures examine the principals' (VCs') and agents' (entrepreneurs') governance arrangements interesting to explore. Three main forms of agency problems have been identified. These are:

- The Principal-Agent Problem
- Principal-Principal Problem
- Principal-Creditor Problem

The first problem arises between owners and managers in the organizations due to the separation of ownership from control because of the birth of large corporations. For example, "the agent may take unfair advantage of its superior information: if external conditions are favorable and could exert little effort and produce a low output while claiming that this low output is due to unfavorable external conditions" (Leruth and Paul 2006, p. 1). With regard to the Principal–Principal Problem, the underlying assumption is that the conflict of interest is between the major and minor owners. Finally, the Principal-Creditor Problem is between the owners and creditors due to the projects undertaken and the financing decision taken by the shareholders.

## Performance Information: Empirical Research So Far

Moynihan and Pandey (2010) define performance information as an organizational behavior that employees have discretion on whether to use it or not and the degree to which they engage in it is "influenced by the social context and formal systems in which they work" (p. 852). Performance information is an important component of performance, which is concerned with using data generated from the performance management cycle for their intended purpose. Performance information also refers to the metrics or the feedback obtained from the performance targets or indicators of implementation processes which are meant to correct bad performance and enhance future performance and to steer, control, and make decisions on the outcomes of the performance (Van Dooren et al. 2015).

The empirical literature indicates that performance information is less known (Pandey 2016). At the same time, performance information is used in the private sector more compared to the public sector (Courty et al. 2005); however, recent evidence suggests that performance data is being used in public organizations through legislations (Hahn and Loprest 2011; National Treasury 2011). Performance information is used for the efficient running of the administrative system of government bureaucracies, while, at the same time, it is used purposely for political reasons especially to advocate for program resources in government agencies.

Performance information is also viewed as a political decision-making tool in setting performance targets for budgetary allocations especially in times of fiscal austerities. The performance data is most useful to allocate resources to where they are needed most. Political actors and civil society organizations demand performance data inform to them which programs will receive funding during a financial crisis. Therefore, performance data become a lifeline, which influences budget priorities in the public sector (Van Dooren et al. 2015, p. 2). It is also important to note that the allocation of resources, citizen/customer satisfaction, reporting, and monitoring (Van Dooren et al. 2015) depict why performance information supports budget priorities in critical fiscal distress.

It should be noted that the wheels of accountability rest on performance information which ensures that public organizations are accountable in the use of public funds to improve government performance in the provision of social services to citizens (Pandey 2016). Pandey observes that performance information is expected to serve accountability purposes in public organizations and to uncover better ways of improving performance. Similarly, accountability frameworks also allow public organizations to produce results on government policies. Besides, performance information helps in steering, controlling, learning, and accounting (Van Dooren et al. 2015). Also, Moynihan (2005) in a study of US public institutions found that the US state legislators use performance measures to assess the performance of public institutions as a tool for holding these institutions accountable.

## Performance Measurement

Ivanov and Avasilcăia (2013, p. 1) defined performance measurement as "regular measurement of outcomes and results, which generates reliable data on the effectiveness and efficiency of programs." The diversity and multiplicity as well as

the competitiveness and complexity of the environment in which companies function have led to an emphasis on performance management. This environment includes the development of similar strategies, services, and goods by organizations.

Four main measures have been identified to measure the performance of the innovation process. This includes the Balanced Scorecard, Malcolm Baldrige, Performance Prism, and European Foundation for Quality Management (EFQM) (Ivanov and Avasilcăia 2013, p. 1). Also, economic-based ones such as Activity-based costing (ABC), the Balanced Scorecard, and Economic Value Added (EVA) have been identified. The most effective form of performance measurement has areas that can measure innovation – which is key to the survival and success of organizations (Ivanov and Avasilcăia 2013, p. 1).

Performance measures can be likened to benchmarks used in determining the outcomes of policy or program goals. Performance measures can be both quantifiable and qualitative goals depending on the objectives and targets that so desired. Besides, performance measures are proportional to the organizational goals and the mission (Kelly 2002). Performance measures are essential in governmental reforms agenda globally and are influenced by legislators and citizens for higher accountability, responsiveness, and quality service delivery.

There are various types of performance measures in the public sector, for instance, traditional workload measures, accountability measures, and service quality improvement measures (Yang and Hsieh 2007). Many public institutions measure performance through simple workload measures or output measures. For example, simple measures are recorded as to how many services are produced, the number of "applications processed," "letters written," meters read, arrests made, etc. These measures are the most basic and easier to count and report on (Ammons 2002). But such measures are too shallow in determining complex situations. Consequently, governments are beginning to use results-based measures for the effective allocation of resources through budgeting.

## Functions of Performance Measurement

Performance measures have two aims. First, it supports accountable measures that relate to performance reporting. Because stakeholders expect that public managers would be accountable for their actions and inactions in the use of public resources in the discharge of their duties. However, a performance measurement that is directed toward performance reporting or accountability is less likely to be effective. This is because measures that are directed at appealing to elected officials, citizens, and the media are likely to produce little feedback for future performance and managerial decision-making (Behn 2003, p. 308).

Second, it is oriented toward performance improvement and the economic use of resources (Ammons 2002). Mostly performance measurements are geared toward the economic use of limited resources for higher returns (Ammons and Rivenbark 2008). Ammons and Rivenbark note that there are higher-order measures, which measure accurately the relationship between "production outputs and the resources to produce the outputs while effectiveness measures the outcomes of the resource usage" (p. 308). In performance measurement, the 3Es must be highlighted, Efficiency, Effectiveness, and Economy, in the use of public resources (Curtright et al. 2000). Despite the superior quality of efficiency measures, it is difficult to translate how a measure relates outputs to resources with precision, but the process of establishing efficiency measures demands "accurate measurement of outputs and inputs" (Ammons and Rivenbark 2008, p. 309).

## Austerity: A Response to Past Poor-Planned Spending

According to Pattaro (2018), austerity originated during World War II in Great Britain to mean a "policy on deficit-cutting which lowers public spending, higher taxes, or both" (p. 459). Austerity is also viewed as fiscal consolidation measures adopted during economic recessions. Because austerity requires severe budget cuts during a

crisis, it involves priority setting to ensure that the limited public resources are targeted at the most important policy objectives. For example, during the 1997 Asian financial crisis and the 2009 Tom Yam crisis in Thailand, the governments in Asia cut their expenditures to very low levels to contain the crisis to redirect public funds to employment generation and manufacturing industries (Chompukum 2011; Koike 2013). The 2008 global financial crunch saw a fiscal consolidation across Europe and the United States where governments cut total public expenditure by reducing the size of the public sector.

Although fiscal austerity is seen as a good measure in public budgeting, it also indicates the fiscal irresponsibility by public agencies in allocating resources to areas that need funding most. It can be argued that austerity becomes a necessary measure in budget processes because of the indiscipline of government and the increasing debt burden. For instance, in Ghana, the government has consistently pursued policies that lead to budget deficits, yet there is no fiscal will to cut down the size of government to reduce public expenditure to allow areas of the budget such as the health and education sectors to see more investment. In tune with this lack of fiscal discipline, the government may be forced during a financial crisis to cut spending as a measure to redirect funding to priority areas in the annual budget.

Also, most governments in developing countries do not have spending plan as it occurs in the West; therefore, their debt-to-gross domestic product (GDP) ratio keeps rising without any investments to show for it. Consequently, it is expected that many countries both developed and developing may face post-COVID-19 financial crises due to the current fiscal measures being adopted to tackle the pandemic. The result will see extreme austere measures such as increasing government taxation, job cuts, and downsizing in both the public and private sectors. Additionally, the post-COVID-19 crisis will further force governments to put in place strict performance evaluation systems to ensure public agencies channel resources to priority areas. This will further amplify the reduction of central government transfers to local governments to redirect funding to aspects of the economy that need urgent restructuring.

## Performance Information Use Under Austerity

Ortiz and Cummins (2019, p. 8) note that austerity and the resulting agenda that minimizes public policies have become a "new normal," inflicted on 75% of the world population. Austerity measures were introduced as a result of poor and bad fiscal choices. Bjørnholt et al. (2016, p. 2) observe that no single theory supports performance information use. It could be used for different reasons and in different circumstances (Cepiku et al. 2017, p. 1). A central component of the effort to transform public management involved using strategic planning and performance measures for budgeting decisions. It grew with the development of the New Public Management (NPM) (Hammerschmid et al. 2013, p. 1).

Performance information has also been adopted in critical times especially to draw budgets. This led to what is termed as Performance-Based Budgeting (PBB). The key elements shared by most Performance-Based Budgeting (PBB) reforms include budgeting based on output and outcome targets and financing executive agencies based on output targets. The budget is a central policy document of government, showing how it will prioritize and achieve its annual and multi-annual objectives. Apart from financing new and existing programs, the budget is the primary instrument for implementing fiscal policy and thereby influencing the economy as a whole.

Bjørnholt et al. (2016, p. 2) also opine that performance information use in a budgetary context can lead to more efficiency and effectiveness. The use of a PBB system is commonly associated with the following activities:

- Setting measurable objectives and performance indicators for government programs
- Presenting expected results alongside spending levels in budget documents
- Measurement and reporting of results during or after program execution

- Evaluation of results and use of this information for strategic planning and budgeting (Ibid, p. 3)

## Using Outcome-Based Measures to Set Budget Priorities

Outcome-based measures consist of goals, standards, measures, and consequences (Hahn and Loprest 2011). First, goals are desired ends of a policy or a program, which are set at the national, state, and local levels. Each of these levels is given the authority to choose a range of possible priorities. These goals are stated based on the purpose, desired outcomes, indicators of performance, and the anticipated and unanticipated consequences of each goal. For example, employment goals could indicate measures such as earnings rate, job retention rate, job placements, and placement wages. These indicators will help to identify investment areas where resources should be channeled into job creation in a budget. However, the problem is that these measures are difficult to reach a consensus because the use of public funds generates controversies and interests. Besides consensus building, goals are difficult to measure in public institutions.

Also, goals will determine how funds must be distributed among the priorities chosen for particular goals. It is important to note that the degree of variation in goals is subject to the areas that are considered critical in the budget. In the case of fiscal austerity, goals that relate to health, education, and security might attract more funding than others might. The goals that are selected are based on broad consensus and the availability of data. The next phase after the agreement on goals for a priority area is the development of specific measures to reflect these goals using both operational and conceptual models (Hahn and Loprest 2011). For example, the availability of data is a primary operational concern.

The goals must be linked to specific measures for which accurate and comparable data are readily available at less cost. The quality and the timeliness of the data used to calculate the measures are necessary to generate feedback on the outcomes of the measures on each budget priority area. In this, national surveys, statistical data on the economy, and other sectors could support in this regard. One challenge is obtaining data that is clean from these sources because early studies indicate that data systems, for example, in the United States, felt short of the requirements for reliable data. According to (Hahn and Loprest 2011, p. 31):

> These experiences have found that data for some measures cannot be collected at all, while others can only be measured poorly. Moreover, the cost of developing or improving data collection systems can be substantial. While states are collecting a range of information about… that required under federal reporting rules, they do not all collect the same data elements. Even when the same general information is collected, there is no consistency in how it is measured across states

Second, outcome-based measures involve the actual measures relevant to the goals and the desired outcomes of policy. Besides, how public officers will understand the metrics and generate reports that are valid to measure the outcomes is another concern. The standards to be expected in the performance of the goals are realigned with the objectives and mission of the budget. It is imperative to link the setting of performance standards to the resources allocated in the budget to ensure that the standards are not low or high to affect the outcomes on the priority areas of the budget estimates. While designing outcome standards, it is important to set a baseline comparison point in the performance data from the previous budget process to determine the consequences of each standard under the desired goals. Sometimes, national averages could be used to set standards in budgeting formulation while controlling for the differences in economic and demographic factors.

Third, outcome-based measures include a set of objectives designed to achieve outcomes by investing financial resources in each activity of the budget. Government agencies and ministries can adopt a tactical mechanism to operationalize public policies in the formulation of the missions, action plans, and performance indicators to ensure that these dimensions are built into the budget priorities (Lande 2018).

Another important dimension of using outcome-based measures in budgeting is the existence of a strong managerial strategy. With good organizational culture, public agencies could use the strategic choice model on what strategic plan to use in achieving the desired outcomes. This is because budgeting involves the expense of monetary resources to achieve the objectives of a given policy or program which demands a strong presence of managerial skills. In determining which objectives will become the forgone opportunity under austere fiscal crisis, management needs to be creative to innovate. Also, an effective managerial foresight will ensure that strategic objectives are differentiated from operational objectives in resource allocation.

Similarly, outcome-based measures in budgeting allow for flexibility. This is important as captured by Lande (2018) that usually parliament votes on the distribution of resources based on major programs; however, some flexibility exist for public managers to reallocate resources "between actions within the same program and reallocation within an action, between the different expenditures" (p. 424). Although there is flexibility in the reallocation of funds within a program that has been approved by parliament, for example, in terms of acquiring human resources for program implementation, the cost of hiring such employees is subject to the estimates of the next fiscal year's allocation. In Ghana, for example, hiring of staff for a particular ministry or agency requires parliamentary approval through the Ministry of Finance. However, approvals are given to agencies or ministries to hire, subject to the Ministry of Finance granting a financial clearance before the next budget presentation to parliament. In line with this, reallocation of resources within a program or action is flexible only to the extent that it excludes certain kinds of expenditure. Ministries and agencies cannot exceed their quota without parliament's mid-year budget review session.

Generally, outcome-based measures are only suitable under a normal fiscal year; however, under austerity, it will be difficult to use these measures under high information limitations. For example, with the current COVID-19 pandemic, approval of funding by parliament is limited because the crisis makes it difficult to scrutinize data brought before the House for deliberations. For example, recruitment of emergency staff to support frontline health workers and allocation of funds for materials and medical supplies are done concurrently without outcome-based budgeting. To some extent, outcome-based budgets only serve as a qualitative source of information for parliamentarians than financial allocation (Lande 2018, p. 425).

## Challenges of Using Outcome-Based Measures in Government Institutions

Outcome-based performance measures may be better tools for decision-making and efficient use of public resources during austere periods which demand high fiscal discipline. However, there are several challenges, which government agencies may run into in their effort to set budget priorities. In most cases, outcome-based measures are poorly designed; this is particularly so because many of the measures are mainly produced for performance reporting that is based on accounting for outputs used rather than results. Thereby, neglecting "higher-order measures which can capture complex outcomes rather than only the 'raw count of workload or outputs' that are produced" (Ammons 2002, p. 346).

Besides, Mcbride (2008) points out that measuring budget performance in public institutions could be difficult, but at the same time, public organizations' performance measures can be directed at creating a framework of the elements that are integral to their core mandate during budget preparation. He proposes that for public institutions performance measures to be evaluated, the measures must be based on transparency, citizen/customer satisfaction, meritocracy, organizational climate, efficiency, information technology, strategic management issues, leadership, accountability, and integrity and these must be published on scorecards and league tables for stakeholders to assess the performance of public institutions.

Outcome-based measures are a challenging task for most organizations when it comes to

what to measure, how to measure, whom to measure, and why to measure (Ammons and Rivenbark 2008; Behn 2003; Grizzle 2002). Earlier performance measurement systems appeared to have been characterized by problems of evaluation and bias on the part of supervisors and subordinates because of a lack of objective performance data. The availability of performance information for reporting outcomes is mostly nonexistent in some transitional and emerging economies. And even where performance data exist, its quality concerns about the effectiveness of program implementation (Hahn and Loprest 2011).

There are unintended consequences associated with performance measures because public managers are not using performance information for decision-making (Kroll and Vogel 2013). Grizzle (2002) notes that efficiency measures must lead to greater efficiency, and outcomes measures must lead to better outcomes, but this has eluded public organizations many times. In many government organizations, public managers are nonreactive or indifferent toward performance targeting. For example, efficiency or outcome measures may be subjected to manipulations by public administrators through the division of tasks to other lower-level employees to reduce cost. However, by decentralizing programs, it may lead to inefficiency and undesirable outcomes on the program goals. Therefore, designing outcome-based measures that mitigate the unintended consequences is central to achieving the desired outcomes on budget priorities.

## Conclusion

From the discussions, performance information is important in the development of outcome-based measures in setting budget priorities during fiscal austerities. However, the ability of the outcome-based measures to be accurate and precise is an important determinant of how well funding allocation will be given to each priority area. The budget indicators must measure what they are supposed to measure and whether they are linked to the goals and mission of the organization.

[2]University of Potsdam, Potsdam, Germany

### Synonyms

Effectiveness; Efficiency; Life cycle; Performance; Performance indicator; Performance information; Performance management; Performance management system; Performance measurement; Transformation process

### Definition

*Performance* is a complex concept (Van Dooren et al. 2010, pp. 16–20; van Helden and Reichard 2013, p. 11): it comprises several measurable aspects concerning the functioning of an organization, and particularly what this organization achieves. In the public sector, performance is related to public policies and aims at realizing

societally relevant goals. *Performance measurement* is defined as the measurement of performance indicators considered as relevant and useful by decision-makers in public sector organizations, for a broad variety of purposes, including the reporting of these indicators. *Performance management* is defined as the way in which the information of measured performance indicators is used for those purposes, such as planning and control, accountability, and learning. The targeting of performance indicators and the analysis of variances between targeted and realized values of performance indicators are the main elements of performance management.

## Introduction

Performance management has always been important to some extent in the public sector, because rather than financial results, the accomplishment of societally relevant goals is what counts. And performance information about those goals can be helpful in monitoring whether underlying actions are appropriate. However, since public administration came under the influence of new public management (NPM) over the last three decades, public sector organizations moved toward result orientation, and, therefore, performance management became increasingly important (Hood 1995). Politicians are now interested to show to their voters the impacts of their policy making, for example, whether promised highway connections were realized and related traffic flows improved. Public sector managers now feel more accountable for the services they deliver, including the societal effects of these services, e.g., the number of sold theater tickets and the cultural value of the theater events.

This entry introduces and illustrates the main concepts of public sector performance management, including the way in which performance is measured with performance indicators and how performance information can be used by public sector politicians and managers.

The remainder of this entry proceeds as follows. The next section introduces the basic logics and mechanisms of public sector performance management and it identifies the types of performance indicators of a public sector organization. The following section discusses the lifecycle of a performance management system, which comprises the stages design, implementation, operation and use, followed byÂ some applications of performance management in public sector organizations. The final section provides some reflections and conclusions. Various aspects of performance management will be illustrated by examples from a variety of public sector organizations and – in separate text blocks – from the city of Groningen, the Netherlands.

## The Basic Logics and Mechanisms of Public Sector Performance Management

A performance management system (PMS) can be established for different purposes. At first there are various internal purposes within a public sector organization (PSO), e.g., strategic and operative planning, steering, monitoring, controlling, and learning. Secondly, a PMS can be used for rendering accountability to external stakeholders and for providing data for external (policy) evaluation. Performance management (PM) in public administration is the result of a shift of emphasis from steering with inputs (e.g., via budgets) and based on formal, bureaucratic procedures toward a much broader spectrum of performance covering inputs and activities as well as outputs and outcomes. Politicians and managers are expected to focus their steering on goals and on politically intended outcomes. This comes along with some cultural change – from a bureaucratic to a managerial culture. PM is central to this new logic: it provides the necessary data to plan, steer, and control a PSO for achieving a certain performance.

As every organization, a PSO can be seen as a system in which *inputs* (resources) are transformed with *throughputs* (activities) into *outputs* (services) that ultimately generate *outcomes* (effects). Performance indicators (PIs) can be identified for inputs, throughputs, outputs, and outcomes. Particularly for measuring outcomes, several PIs will be needed to provide a realistic

picture of the different features and dimensions of an outcome.

Additionally, this conceptualization enables an assessment of the organization's efficiency and effectiveness, as displayed in Fig. 1. *Efficiency* relates the inputs to the outputs and establishes whether the outputs are produced at a sufficiently low cost level. *Effectiveness* links the outcomes to the outputs, enabling the organization to find out whether the outputs have led to the desired effects (Johnsen 2005, p. 11; Jackson 2011, p. 16; Van Dooren et al. 2010, p. 18). Other aspects of public performance are responsiveness to citizens and legitimacy toward various stakeholders, although these aspects are not linked to the model in Fig. 1.

The organization often defines objectives with regard to its transformation process. An objective is translated into measurable aspects through performance indicators (PIs), and subsequently targeted (ex ante) and realized (ex post) figures about these PIs are compared, both for accountability reasons and for considering corrective actions. An example can illustrate this.

Suppose a municipality observes that children living in low-income families on average show a low participation rate in sports and cultural events. It wishes to enhance the opportunities of this target group for taking part in these types of events. This objective is informed by an investigation which indicates that participation of children in societal activities increases the likelihood of a better school performance and perspectives on getting a job in the future. Suppose further that the target group of children between 6 and 15 years in low-income families is 20,000. Currently, only 15% of this target group are active in the domain of sports and cultural events, and the municipality wishes to raise this share to at least 60%. Participation in sports and cultural events has to be made measurable through PIs. Possibly relevant PIs are the number of children attending sports or cultural events on a regular basis of at least 30 times a year (PI sports and PI culture). The municipality further decides that taking part in either sports or cultural events is sufficient. In consultation with sports clubs and cultural organizations (museums, libraries, theater schools, etc.), the supply of relevant services is increased, for which the municipality provides subsidies amounting to 400,000 euros on a yearly basis. After these additional opportunities are made available supported by a promotion campaign, the municipality measures the actual figures of the PIs, which are PI sports = 9500 and PI cultural = 1500, so in total 11,000 children participate which is close to but below the target value of 60% of 20,000 = 12,000. Now, corrective actions can be considered, ranging from intensifying promotion campaigns to finding more attractive sports and cultural events, or ultimately accepting that a 55% participation rate is not so bad. This example shows that translating a public sector goal into appropriate PIs and related targets is a delicate process, in which diverging choices have to be made: what is meant with participation in the society by children?; what is an acceptable rate of participation?; how much resources are needed for a supply that can achieve a certain target participation rate, etc.? In addition the example shows that diverging types of PIs are relevant, ranging from resources (input) to cultural and sports supplies (throughputs) and from participation rates (outputs) to long-term effects on school

**Performance Management, Fig. 1** The transformation process of a public sector organization

performance and job chances (outcomes), although the latter are not explicitly measured.

Table 1 gives two further illustrations of performance indicators for different types of services. The first illustration about a municipal swimming pool is quite straightforward as it regards a process with standardized activities leading to clearly identifiable outputs and effects. The second illustration about a reintegration program for unemployed people concerns a relatively complex governmental service, which is characterized by heterogeneity of activities and ambiguous outputs and outcomes. Performance measurement is evidently more difficult in the second than in the first illustration. This can be explained further as follows.

Activities of a swimming pool, the first illustration in Table 1, are standardized; during opening hours tickets have to be sold, the swimming pool has to be cleaned, and there is some need for keeping an eye on the swimmers. So an opening hour is an adequate proxy for swimming pool activities. The output is the number of paying customers. The outcome of a swimming pool may be its contribution to a healthier lifestyle, but this connection is not easily identifiable. A more pragmatic outcome can be the extent to which customers show their satisfaction in a questionnaire about the swimming pool. Efficiency is then a relation measuring the resources over the output, which turns out to be 7.10 euros per paying customer; this figure can be compared with the tariff – for example, 5 euros – indicating that the difference between the cost and tariff level needs subsidizing from the municipality. The cost and tariff level can also be compared with previous years and with those of neighboring municipalities, in order to assess the relative attractiveness of this service. The percentage of customers with a sufficiently high satisfaction score in relation to all customers indicates the effectiveness of this municipal service.

Reintegration of unemployed persons on the labor market, the second illustration in Table 1, can comprise a set of quite diverging activities, including consultation sessions with employment specialists, contacts to local employers, training sessions with various contents (e.g., presentation in job appraisal interviews and improving job-related skills), as well as internships with potential employers. The output can be defined as the number of participants trained and advised in the program. The outcome is the success rate of the program, i.e., how many participants actually get a job within a certain period of time. Efficiency is here the costs per participant and effectiveness the percentage of participants getting a job after a certain period. This effectiveness measure is

**Performance Management, Table 1** Different types of performance indicators with two illustrations (numbers or amounts of euros are defined per year)

| Types of performance indicators | Definition | First illustration: municipal swimming pool | Second illustration: reintegration of unemployed persons on the labor market |
|---|---|---|---|
| *Inputs* | Resources in money or physical terms | 250,000 euros | 1.4 million euros |
| *Throughputs* | Activities | 800 h operation of swimming pool per year | Different types of activities, including training sessions and internships |
| *Outputs* | Offered services | Provision of swimming facilities to 35,000 paying customers | 180 participants |
| *Outcomes* | Effects | 28,000 paying customers with a higher satisfaction rate than 7.0 (on ten-point scale) | 45 participants successfully entering the labor market |
| *Efficiency* | Cost per unit of service | 250,000/35,000 = 7.10 euros per ticket | 1.4 million/180 = 7.777 euros per participant |
| *Effectiveness* | Effect per unit of service | 28,000/35,000 = 80% are satisfied given 7.0 target | 45/180 = 25% are successful |

rather ambitious, because many other factors are influential for jobless persons in getting a job, such as general labor market conditions and the already available job-related skills of participants.

The transformation system, as shown in Fig. 1 and illustrated in Table 1, enables to typify the specific character of the public sector. While private sector organizations' ultimate outcome is financial success, mostly profitability, in the public sector, financials are mostly not goals but constraints (e.g., keeping within budgetary limits or breaking even). In addition, PSOs have to serve a clearly defined public interest, i.e., they need to accomplish societally relevant goals. That is why outcomes are the final and most important link in the chain of the transformation process in the public sector (van Helden and Reichard 2016). However, defining outcomes, and thus effectiveness, is the most complex part of the PMS. In general, the assertion can be made that the more the outcome indicator is related to societally relevant goals and to public policies, the more difficult it is to make the connection between this outcome indicator and the underlying set of activities and outputs. This is due to the influence of other factors on the outcome, which is beyond the controllability of the PSO. Further, outcomes are often difficult to measure as they cannot, or only through certain proxies, be quantified (e.g., a healthier lifestyle, a stronger cultural involvement). That is why outcomes are often defined quite pragmatically and closely connected to the transformation process of the public sector organization, especially through quality of service indicators. However, a trade-off exists between relevance and simplicity of outcome indicators; the more relevant an outcome is, the more difficult it is to measure it adequately, and easy-to-measure outcome indicators are often only crude proxies of what really matters.

One of the types of indicators derived from the transformation process is the quantity of service units, i.e., the output. In a public sector context, it is often desirable to indicate to what extent a potential target group is covered by a certain service. For example, how many poor citizens, as defined in a specific way, receive low-income support from a municipality as a percentage of the total number of poor citizens? Or what is the relative number of drug addicts in a certain region taking part in a governmental rehabilitation program? This relative reach of a target group is called *equity*.

A distinction is sometimes made between a single and a composite performance indicator. A *single indicator* measures one aspect of a transformation process, whereas a *composite indicator* includes several of those aspects. An illustration: if equity, efficiency, and effectiveness are all measured by the same scale, ranging from 1 (poor) to 10 (excellent), a composite performance indicator can be the average of the three scores. So, if equity, efficiency, and effectiveness have scores of 6, 8, and 5, respectively, the composite score is 6.3 (= (6 + 8 + 5)/3)). Composite indicators can be attractive if stakeholders want to get a comprehensive and concise impression of the performance of a public sector organization. However, by averaging scores of different indicators, simplicity is served but some possibly important information is lost.

**Illustration: Performance Indicators for Delivering Social Benefits in Groningen City**

The activities of one of the divisions of the municipal organization in Groningen, the Netherlands (about 200,000 inhabitants), regard income assistance to unemployed people, i.e., who do not have work-related income. The main set of activities is concerned with providing social benefits, which is a mandatory municipal task constrained by central government regulation, but the division is also responsible for other tasks, especially providing specific benefits, delivering financial support for social activities, and giving assistance for relieving financial debts. One specific department within the division is responsible for delivering social benefits.

In addition to indicators concerning the level of receivables and the recovery of

(continued)

unduly granted benefits, this department uses the following two key performance indicators:

1. The period within which an application for a social benefit has to be decided: the target level is 8 weeks.
2. The cost level of activities relating to decision-making about an application for a social benefit: the target for this cost level is that each employee can handle one application in about one working day.

The first indicator and its target level are determined by central government regulation. The second indicator and its target level are based on a caseload analysis of these activities; the average amount of applications per week is about 100, and the number of employees responsible for interviewing applicants, checking, among other things, their financial background, and preparing a decision about an application is 19; this workforce is sufficient given the workload.

The first indicator is an example of a quality indicator: applicants know in advance that they get a decision on their application within a reasonable time. The second indicator is an efficiency indicator. Efficiency is not measured as the total costs in euros over the total output (applications), but as the required number of employees handling applications over the total output in a certain period. The workforce is thus seen as the main cost factor.

On the longer term, particularly within a period of 2–3 years, Groningen wishes to accomplish a significant cost saving in its process of delivering various types of social benefits. A distinction is made between a front office (conducting contacts with clients and handling the specific elements of their application) and a back office (responsible for the processing of the applications, including decisions about the handling of payments). A concentration of the back office of 13 cities in the Netherlands at one location with strong IT support is intended, while the front office remains with these cities separately. This will lead to a lower-cost level of the second performance indicator.

## The Life Cycle of Public Sector Performance Management

Performance management (PM) in the public sector often evolves according to a certain life cycle, which comprises four stages (Fig. 2): design, implementation, operation, and use of a PMS (van Helden et al. 2012; van Helden and Reichard 2013). A PMS is embedded into its organizational and task-specific context and is expected to provide certain performance information which is used for various purposes. At first, a PMS has to be "constructed" according to the specific information needs it is expected to satisfy. Thereafter, the PMS needs to be incorporated into the PSO ("implemented") and to be prepared for its operation. "Operation" is then the regular functioning of the PMS, i.e., the collection, generation, and supply of performance data for the specific purpose of the PMS. And "use" means the utilization of performance information by the various addressees of the PMS. The operation and use of a PMS finally result in certain effects, primarily in a (hopefully) improved performance of the organization. Design and use are the most important stages of the PMS: the first sets the course for the whole PMS; the latter is the major purpose of the whole exercise: develop performance information and use it for better decisions or for external accountability and control.

Finally, a PMS has certain impacts on its organizational environment. Obviously, its main aim is whether it leads to better performance. This assessment/evaluation of the PMS is concerned

**Performance Management, Fig. 2** The life cycle of performance management systems

with learning how a PMS can be updated and revised due to experiences. Additionally, it is relevant to assess whether a PMS contributes to a better functioning of the public sector organization, in terms of, for example, efficiency and quality of service delivery. Figure 2 shows the four stages of the PMS and also how it connects with its environment.

Below, the stages of the PMS life cycle are elaborated further.

## PMS Design

In the design stage, the general structure and mechanisms of the PMS are determined, e.g., the extent to which performance information should be regularly collected. In this stage, the main questions about the content of the PMS are answered (Van Dooren et al. 2010, pp. 54–75):

- Which PIs are to be selected, and what are the targets for the PIs?
- What degree of detail of PIs should be achieved?
- With which methods should certain inputs, outputs, and effects be measured?
- In which rhythm should data be collected, analyzed, and reported?
- Who are the main recipients of performance data and which type of data do they need?
- How can the quality of the PMS regularly be assured?

Often the selection of PIs is driven by the goals or strategy of the organization. Design can also result in a multidimensional complex structure of a PMS, such as the balanced scorecard or quality measurement models like the concept of the European Foundation for Quality Management (EFQM) or the Common Assessment Framework (CAF).

Targeting, as part of the design stage, means that for each PI, the desirable value has to be established, for example, for a quality indicator a 7.5 on a 1–10 scale and for a cost indicator the amount of euros per customer (e.g., 8 euros per swimming pool visitor). Targets can have different sources. Benchmarking among similar suppliers can inform targets, particularly by indicating that a PSO does have to perform at least on an average level or on the level of the best 25% of the benchmark. An alternative option is that targets, especially cost targets, are based on a technical analysis of the underlying processes. A pragmatic but quite crude form of targeting is requiring that the performance has to be improved with a certain percentage, for example, a 2% improvement of performance each year.

## PMS Implementation

Implementation is the stage of incorporating the PMS into a PSO (Moynihan 2008, pp. 75–94). The system has to be established in the units of an organization, IT applications have to be developed, and procedures and regulations have to be put into effect. Additional issues are piloting of performance indicators and training of employees aimed at understanding and using performance indicators.

## PMS Operation

In this stage, the PMS will be set into operation (Van Dooren et al. 2010, pp. 96–115). It supplies

the expected performance data to the various users of such data inside and outside the respective PSO (e.g., via a periodical reporting concept).

### PMS Use

What ultimately matters most is that the performance data provided by the system is used. The use can be intensive or extensive, functional or symbolic, rigid or flexible, all dependent upon certain contextual circumstances. The use of performance information can be seen as the demand side of a PMS which depends on the attractiveness and appropriateness of performance information supply (Brun and Siegel 2006) but also on various individual and contextual characteristics of the users. Who the users of performance information are largely depends on the specific purpose and function of a PMS. In many cases, managers of sector departments of a PSO will be the main users. Additionally, elected or appointed politicians may be a target group, e.g., aldermen or councilors of a municipality. Other external groups of recipients may also be relevant, e.g., supervisory authorities or courts of auditors.

The data provided by a PMS is used for different purposes. PSOs use performance information to a significant extent for external control and accountability, e.g., to inform oversight authorities, the legislation, media, or citizens (Moynihan and Hawes 2012). Additionally, performance information is frequently used for internal planning, steering, and control, particularly in organizations following an NPM-based reform philosophy (Taylor 2011). Furthermore, a PMS is used for benchmarking exercises, e.g., among different municipalities (Ammons and Rivenbark 2008).

The use can be different according to various dimensions. Here the following types of performance information use are discussed: intensity of use, functional versus symbolic use, rigid versus flexible use, and coercive versus enabling use.

Compared with private organization actors, PSOs are expected to use performance information less intensively. Empirical evidence, however, indicates that the differences between the two sectors are less explicit (van Helden and Reichard 2016). One actor group is of specific interest: politicians, e.g., members of parliament, local councilors, and aldermen. Here, the empirical picture is diverse: sometimes politicians are reluctant users (Grossi et al. 2016); in other cases they seem to be quite interested in such data (Askim 2007). These diverging results are not surprising as the intensity of performance information use is dependent on a series of influence factors, e.g., tasks, organizational structures, culture and tradition, individual features of the actors, etc.

Functional performance information use is identical to rational use, which implies that information is used for achieving organizational goals. An example of functional use is the search for corrective actions aiming at improving organizational performance when actual performances are lagging behind targeted performances. Symbolic use, on the contrary, means that rather than achieving better organizational performance, other goals are at stake, for instance, giving an impression of modernity to certain external stakeholders. Symbolic use thus does not lead to rational actions, but it can strengthen PSO's legitimacy (Modell 2009).

Performance information is used in a rigid way when rules about the use are strict and consistently applied. For example, rules are developed that prescribe more than 10% better performance than a certain target leads to a specific bonus, while a more than 10% lower performance than this target induces a specific sanction. If these rules are applied without consideration of contextual circumstances – e.g., was it easy or difficult to achieve the target given the economic conditions? – then, performance information use is rigid. However, when the accomplishment of a bonus or sanction is part of a dialogue between an employee and his/her boss, in which the realized performances play a role but also information about the context in which these performances were realized, then performance information is used in a flexible way (ter Bogt 2004).

Mostly internal use of performance information aims to stimulate employees to act in such a way that organizational objectives are accomplished. This type of performance information use is embedded in a command and control device

which can be denoted as a coercive use. However, performance information can also facilitate lower-level managers and employees to do their job in a better way. This is called an enabling performance information use (Wouters and Wilderom 2008).

A simple recipe for the most desirable type of performance information use is impossible, but some suggestions can be given. The intensity of use often depends on two factors: the regular frequency of reporting, sometimes prescribed by regulations, and whether the organization is confronted with certain problems – problems often induce a more intensive information use. In general, functional use is preferred above symbolic use, and functional performance information use benefits from involvement of decision-makers in the design of the PMS; the more it becomes their own information system, the more they will be inclined to use it according to its purposes. This also is a plea for cocreation, thus enabling performance information use. However, coercive use remains important. This type of use may focus on some key PIs for which minimum target levels apply, such as budgetary constraints and minimum service standards, while more detailed and process-related indicators can be used in an enabling way. This also relates to the distinction between flexible and rigid use. In general, flexible use is to be preferred, but a rigid use of key overall PIs can often not be avoided (Van Dooren and Van de Walle 2008).

**Illustration: The Use of Performance Information in the Income Assistance Division in Groningen City**

How is performance information used within the Income Assistance Division of Groningen city (see also the first illustration above)?

Two interrelated planning and control cycles are distinguished. The first one is the cycle of the division as a whole connected with the executive and more particularly the member of the executive for social affairs. The second cycle operates within the division among the manager in chief and his department heads.

The first cycle starts with a divisional annual budget, and in the course of the year, two or three interim reports are prepared. This budget and these reports contain both financial information, especially planned resources for the different types of divisional tasks, complemented with information about various types of performance indicators, mainly output and outcome indicators. A dashboard system is used in the interim reports for signaling actions as a consequence of performances seriously lagging behind targets (a yellow signal is then applied, while a green signal indicates unproblematic execution of activities).

The second cycle is characterized by a larger extent of detail and a higher reporting frequency. In this cycle two types of consultation are distinguished. One is a consultation every 2 weeks among the department managers and the staff members for finance and HRM. The other consultation takes place between the manager in chief and his department heads, both mostly in a monthly management team and bilaterally. In both types of consultation, monitoring of budget execution is the main issue. Both types of consultations operate as mutual checks and balances.

If during one of the above consultation meetings a substantial gap between planned and actual performances is registered – for example, a higher number of employees needed for handling a number of applications than according to the target – corrective actions are discussed. Such discussions start with a consultation between the manager in chief and the responsible department manager, but – if desired – it can be extended to team-wise analysis of the problem at hand.

Managing a division is not limited to performance management. The manager in

(continued)

chief stipulates the importance of other issues, especially, how IT applications can improve processes; which measures are appropriate for making processes "lean and mean"; and how employees can become better equipped for doing multiple tasks.

The above-provided illustration about Groningen city highlights several theoretical constructs about performance information use. Information about performance indicators is used in a flexible way; in case of negative variances between actual and planned performances, responsible managers are invited to explain possible reasons, and the organization is helpful in reflecting about corrective actions. In addition, managing by numbers is seen as important, but proper actions – making processes more efficient – are seen as more important than meeting the targets by "ticking the boxes."

### PMS Impact on Performance

Obviously, the ultimate proof of the functioning of a PMS is if the organizational performance is improving. The performance of a PSO is, however, depending on a number of variables: as explained, on the inputs and activities of the transformation processes but also on various task-specific and contextual variables. To isolate the influence of the functioning of an existing PMS, and particularly of the use of performance information, is not an easy thing. The research on this issue presents inconsistent findings: on the one side, several studies confirm that the implementation and operation of a PMS have a positive impact on performance (e.g., Boyne and Chen 2007; Meier and O'Toole 2009). This is particularly the case if performance information is actively used (Kroll 2015). Other studies either find no clear link between PI use and performance, or they even signal a negative effect on performance. Hood (2012) is particularly critical about possible distortions of outputs and outcomes if PM relies in a one-sided manner on quantitative targets and on rankings.

An illustration of the effects of performance information use on organizational performance can be derived from a study about German museums (Kroll 2015). A survey based on interviews with chief administration officers of public museums in Germany in 2011 showed the following evidence: the use of an existing PMS for managerial purposes alone does not have an impact on the performance of museums. A positive effect can only be observed if performance information is used in a situation where the museum follows a prospective strategy, i.e., where the museum aims to develop better services for its customers. Furthermore, the survey revealed that poorly performing museums are more tightly supervised by their oversight bodies than well-performing museums. Oversight bodies of poorly performing museums use the reported performance information more intensively than those of well-performing museums.

## Application of Performance Management in PSOs

As discussed above performance information can be applied in a PSO, both for internal purposes (e.g., planning and control) and for external, accountability purposes. It becomes increasingly important in budgeting reforms as most of them tend to include performance information in budgets. Another application concerns contracts or service agreements drawn between a PSO and external providers or, within a PSO, among a provider and a recipient of a service. And obviously, performance information plays a dominant role in the evaluation of certain policy programs where intended and unintended effects of policy interventions are to be measured. Finally, performance information is also relevant in human resource management, particularly for the assessment of employees' performance and for performance-related pay (if established).

A PMS is not a single "machinery" installed somewhere in a PSO to provide performance

information wherever and whenever needed. Rather it is a management style which emphasizes the use of performance information with the ultimate aim to improve organizational performance and which results in the establishment of several PMSs in the abovementioned application fields. Public sector PM is therefore interrelated with several other management functions (see, e.g., Schedler and Proeller 2010):

- With the various concepts and tools of financial management (simply because financial performance is part of overall performance).
- With strategic planning and management.
- With operative management, e.g., steering and controlling of public service provision.
- With human resource management.
- With quality assurance and policy evaluation.

## Conclusions and Reflections

PM is in place in the public sector of many countries. Governments at all levels – but predominantly at local level – have implemented PMSs and operate them since several years. Thus, performance data is frequently available in PSOs, for decision-making as well as for external accountability. There seems to be some evidence that the provided data is used and is leading to some performance improvements (see above).

This development evolved in a rather long process. Following Bouckaert and Halligan (2008, pp. 69–127), at least three different stages of development can be distinguished (additionally the authors mention performance governance):

- Performance administration (a rather bureaucratic procedure of data collection and reporting).
- Managements of performances, which are disconnected from each other and do not follow a common logic.
- Performance management, which can be seen as a coherent and consistent integrated system for a whole PSO.

PM is not only a practical concept; it also has become an issue in academic teaching programs and in professional trainings. Furthermore, since about 20 years, PM is an increasingly attractive research topic, in both the private and the public sector (van Helden and Reichard 2016). Research themes followed to some extent the life cycle of PM: at first, researchers dealt with the design and the implementation of a PMS, e.g., by studying how performance indicators are mirroring certain objectives; in more recent times, many researchers addressed the issue of performance information use (see section "The Lifecycle of Public Sector Performance Management"). The effects of a PMS on organizational performance are still in a more initial stage of research; so far most of research concentrated on the functioning of the PMS itself.

The general advantage for a PSO of having an implemented PMS which also is in use is the continuous availability of performance information for the various purposes. Decisions can be based on quantitative figures deriving from measuring PIs related to the different stages of the transformation process of a PSO. This certainly is distinctive to previous times without such systematic data provision.

However, the potential benefits of performance measurement and management are restricted by some critical issues. At first we are often confronted with severe measurement problems in the public sector. Measuring outputs, and particularly outcomes, is in many cases almost impossible. Approximation procedures, e.g., by concentrating on a more easily measurable indicator, are often invalid. Furthermore, the attribution of certain effects to an output is in many cases problematic, as there are no clear cause-effect relationships. In addition, some effects occur with substantial delays in relation to the actions concerned. Various contextual and other external variables have influence on certain performance figures. If it is not possible to establish appropriate and fair measurement practices within a PMS, the whole system may get into trouble. This is often the case with concepts of performance-related pay in PSOs, where employees perceive the measurement methods and criteria as unfair and show decreasing job satisfaction rates.

The logic of PM may result in a fixation of decision-makers on measurable aspects of

performance, in line with the motto "you can only manage what you can measure." Such management attitude may have the unintended consequence that managers ignore nonmeasurable, albeit relevant issues ("what you cannot measure does not matter"). This may lead to one-sided or wrong decisions as well as to negative side effects. When employees are controlled in a very tight way on one or only a few indicators, they may be inclined to disregard unmeasured but still relevant other aspects of their work (de Bruijn 2007). Suppose, for example, that a PSO uses, as a key performance indicator for internal cleaning services, the cost of cleaning a square meter of office floor space and that the target level is 4.50 euros per square meter per month. Some guidelines are issued about the intensity of cleaning activities in various compartments of the office, but what ultimately counts most is remaining under the target level of 4.50 euros per square meter per month. If bonuses are connected to achieving this target, this cost PI attracts even more attention. However, in addition to an efficient use of resources, other aspects are of importance in providing cleaning services, such as achieving a certain quality level and cleaning intensity, dependent upon the various types of office space. If these service aspects are only described in general terms, whereas the cost target is quantitatively expressed in monetary terms, and also crucial in the control, the indicated service aspects will be ignored to some extent or will at least get less attention.

How can these negative side effects of a PMS be avoided? First, the PMS design should cover all important aspects of an organizational unit, preferably specified in similar, for example, quantitative, terms. Second, using performance information in a flexible rather than a tight way is desirable. This implies that information about differences between the targeted and actual performances are on the agenda of consultations between a manager and his/her employees, but these consultations also give room to providing explanations about these differences, including giving attention to unmeasured aspects of service delivery, like being helpful to colleagues, and responding to unexpected demands for particular services. Third, connecting severe control consequences to underperforming or overperforming, in the form of sanctions and rewards, respectively, should be avoided.

In a nutshell, PM has for sure several advantages: it increases transparency of processes and results of an organization, it provides important data for decision-making but also for rendering accountability, and it promotes learning and contributes to improved services. On the other side, PM may eventually lead to various perverse effects (Bruijn de 2007, pp. 17–33): PM may stimulate a tunnel vision (see the above illustration), and it tends to hinder innovation and increase bureaucracy, because it encourages managers and employees to focus on the PIs in the PMS, while disregarding other less measurable aspects of a proper functioning PSO. Evidently, there is a tension between the dangers and advantages of tight quantitative performance controls. Because control needs to be effective in the sense of stimulating desirable types of behavior, it requires that PIs are related to goals and give clear guidance for certain types of actions. But a too tight use of a limited number of PIs also brings about negative side effects. So a balanced design and use of a PMS is the best, but finding this balance is a delicate practice.

## Performance Management and Culture

Justice Nyigmah Bawole and
Mohammed Ibrahim
Department of Public Administration and Health Services Management, University of Ghana Business School, Accra, Ghana

## Synonyms

Organizational culture; Performance and accountability; Performance management; Performance measurement

## Definition

Performance management is a collective process of setting objectives in line with organizational mission and goals and monitoring individual performance in the achievements of these objectives through constant communication and feedback. Inherent in the communication and feedback are

coaching and mentoring, information on performance directions, rewards, and in some cases penalties. Organizational culture relates to relationships and shared norms, beliefs, and values developed over time through both formal and informal arrangements in the organizational setting. National or ethnic culture, on the other hand, emphasizes the indigenous or traditional dictates and practices that define the identity, both individually and collectively, of those who constitute organizational participants.

## Introduction

The turbulence in organizational environments leading to unpredictable futures for organizations now pressurizes them to demand more from their employees. Besides, pressures for bottom line, demands for quality services and products, and the uncompromising attitudes of clients and citizens among other factors have combined to drive organizations to want to improve performance of their employees. In fact, in the last couple of decades, organizations have witnessed a surge in concerns among stakeholders about performance and accountability. Indeed, for public sector organizations, since the introduction of the New Public Management (NPM) with its characteristic emphasis on efficiency and effectiveness in service delivery, there has been intense pressure on organizations to devise better means of ensuring improved performance, both as a survival strategy in a highly competitive environment and to satisfy stakeholder expectations. It has become evident that the quest to explore new ways of improving performance has often been assumed to be more pressing in the public sector than in the private sector. This is based on the assumption that the private sector, at least in relative terms, only needs a readjustment in its operations in order to satisfy new expectations. On the other hand, the general verdict on public sector organizations has often been one of persistent failure – dotted with visible cases of inefficiency, ineffectiveness, corruption, and gloom. In effect, improving performance in the public sector requires some assimilation of private sector practices while also imbibing new ways of enhancing existing performance regimes.

While the jury is still out on the efficacy of NPM prescriptions for the public sector, it appears there near-consensus on the necessity to refine (or deviate from) old ways of doing things in order to ensure performance effectiveness. The call has been on the need for performance management. Underlying this call for a new paradigm is the significant re-awakening to the fact that earlier performance regimes tended to adopt a top-down approach where managers set indicators meant to guide employees in the execution of their mandate. Managing performance is today viewed as a shared approach that recognizes the primacy of collective goal setting, communication, and prompt feedback mechanisms.

Recent knowledge on organizational performance or performance management effectiveness points to the significance of culture in eliciting positive or enhanced response from organizational participants. Here, culture could be viewed from two fronts: organizational culture and national or ethnic culture. Organizational culture relates to relationships and shared norms developed over time through both formal and informal arrangements in the organizational setting. National or ethnic culture, on the other hand, emphasizes the indigenous or traditional dictates and practices that define the identity, both individually and collectively, of those who constitute organizational participants. Nowadays, it is becoming apparent that performance management regimes stand little chance of being effective if they do not create or expand the space for accommodating the organizational and national/ethnic cultures that have defined the behavior or identity of individuals over time. It is important to point out that even though there has been extensive interest in the relationship between performance management and culture, there are also previous studies that have questioned or de-emphasized the role of culture in improving organizational performance (Lim 1995; Wilkins and Ouchi 1983; Schein 1990).

In this section, an attempt is made to explore the definitional issues related to performance

management, its importance and disadvantages, or negative consequences. The section also discusses the definition and forms of culture and attempts to draw or question the link between performance management and culture.

## Performance Management: Concept and Relevance

There is a notable tendency to use the concepts of performance management and performance appraisal synonymously. Elsewhere, some organizations purport to have instituted a performance management regime, which upon scrutiny are performance measurements at best. This mistaken assumption or practice finds expression in the various definitions of performance management which are argued to require refinements.

The US Department of Health and Human Services views performance management as the process whereby organizations set targets or goals and ensure that there are processes that check performance against the expected targets. Neely (1999) offers a similar definition when he notes that PM essentially relates to a set of indicators which are meant to gauge the extent of efficiency and effectiveness of employees in the firm. Although those definitions, like several others in the literature, are useful, they fail to highlight the role of the employee in setting targets and the mechanisms needed to be employed to ensure that employees are able to contribute effectively to organizational goals. Studies by Bevan and Hood (2006), Smith (1995), and Kells (2011), among others, point to the likelihood of organizational actors falling into a fixation for measurement concerns, strategic behavior, nit-picking, and other unintended consequences if managers focus on measuring, instead of managing, performance. Perhaps this explains why the Balanced Score Card (BSC) by Kaplan and Norton, arguably one of the most popular performance measurement instruments, has now transformed into a performance management tool. There is also a call to holistic performance arrangements that link individual performance to organizational mission in ways that ensure the realization of broader or strategic organizational objectives.

Based on the above, performance management is defined here as the collective process of setting objectives, monitoring individual performance through constant communication and feedback in ways that ensure the achievement of the organizational mission and goals. This definition highlights some components which are worth noting.

*Continuous and shared process*: Performance management is not a one-time activity; it is an ongoing and sometimes iterative process which entails a number of related activities. These activities involve setting goals or targets and putting appropriate mechanisms in place to ensure that employees are not only guided or checked in their pursuit of those goals but that they are also promptly given feedback on their performance. Thus, inherent in this process are real time corrective measures which address emerging issues which could potentially derail overall performance. What then differentiates this process from other (usually "measure fixation") approaches is that managers do not wait to the end of a task before they proceed to assess the quality of performance and its relationship to the set targets. Equally important is the fact that the shared nature of such a process means that organizational actors or employees do not see it as an imposition by management. Rather, they contribute to the design and shaping of those objectives or targets and thus see success or failure as a collective responsibility. In recent practice, the emphasis on collective performance has led to a laudable practice in some organizations where, even in cases when individual performance in the collective chain needs to be appraised, there is a direct or indirect opportunity for every member to contribute to that process. This means that, contrary to previous practices where only superiors appraised their subordinates, best practice in performance management provides some opportunity for subordinates to also have a say in the assessment of their superiors. Thus, the role of an organizational culture that places more premiums on team work, instead of individualism, is of paramount consideration.

*A shift from outputs to a focus on outputs and inputs*: Several scholars, including Martinez (2001), have observed that the move toward holistic performance management regimes as opposed to mere goal setting and appraisal means that inputs are also as important as outputs. While the latter was previously the focus of managers, the new concern is not only about what people are able to achieve but also how they are able to achieve them. This is akin to the principal-agent relationship that imposes obligations on both parties which must of necessity be met before there could be realistic assessment of performance. Such a shift in management thinking is crucial in providing the requisite incentive for employees to meet performance expectations. In the public sector, for example, there is often a tendency to sit in judgment against public servants for failing to meet their targets, i.e., if they set any. However, little attention is paid to whether public servants have the capacity, resources, and enabling environment to pursue their individual targets, which in most cases are even imposed by their superiors. Thus, given the new line of thinking which places premium on both inputs and outputs, performance management is real in its expectations as it places a burden on managers to provide the resources that would serve as a moral basis to assess the performance of employees. While this is imperative, it should be noted that a good performance management system should not only ensure that resources are provided, but, more importantly, those resources should be utilized efficiently.

*Connection between individual performance and strategic goals or mission*: Employee performance, if properly managed, feeds into the achievement of the mission of the organization. Thus, while various activities could be broken into individual tasks under different sections or departments of the organization, it is imperative to ensure that managers assist organizational actors to see the bigger picture. Viewed sequentially, a good performance management system first sets strategic objectives, followed by unit or departmental objectives, which then leads to the setting of individual objectives. Related to the component discussed early on, the significance of such strategic-departmental-individual level linkages lays in the call to team work in the bid to meet organizational expectations. This is because if individuals are left to operate in "silos," they are likely to pursue different interests and also receive little cooperation from other members of the organization who would view their operations as either in competition or in pursuit of different ends.

Some studies have identified numerous advantages that are likely to accrue to public sector organizations if they implement performance management systems (see, e.g., Aguinis 2005). Among others, performance management helps organizational participants to adapt to change. Here, it is contended that where an organization decides to place more emphasis on some aspects of its operations or introduces new products and orientations to meet customer expectations, it can align its goals and objectives to these new arrangements and accordingly fashion individual tasks through the introduction of appropriate performance management systems. Aguinis, for instance, cites the example of IBM in the 1980s. He notes that given that the company decided to focus primarily on customer satisfaction, the evaluation of the performance of every employee was done in relation to customer satisfaction. In effect, employees had every incentive to focus on the big picture in order to remain relevant to current organizational objectives. Performance management also enhances the motivation of employees to work harder and improve their contribution to the organization. This is because employees get constant feedback on their performance, and this involves prompt communication on areas to improve and commendations on the tasks that they have performed well. Additionally, effective performance management systems require that managers build the capacity of their staff following gaps identified in the appraisal process. This enhances the ability of employees to perform better and in some cases also strive to achieve ambitious goals. Also, managers are able to gain first-hand and prompt information about the performance of employees in order to make better

decisions about rewards, promotion, training, and in some cases disciplinary actions. Elsewhere, Bianchi and Rivenbark (2012) conclude, based a comparative analysis of performance management systems in Sicily and North Carolina, that performance management systems are useful in aiding public officials to exact better forms of accountability and transparency especially in periods of political or economic crisis.

There is no doubt that the discussion so far points to the prospects of improving or enhancing organizational performance, in the public sector especially, through the adoption of performance management practices. While this expectation is justifiable, it is important to note that the introduction of a performance management system does not automatically lead to performance effectiveness; it requires the right kind of environment to thrive. Current practice and research indicate the significance of culture, albeit expressed in varied forms, as being an indispensable enabler in implementing or adopting new performance management systems. Also, it has been argued that if wrongly implemented, performance management could lead to many adverse consequences.

## Performance Management: What Has Culture Got to Do with It?

As pointed out in the previous section, there is a popular thinking in modern management literature that performance management systems could hardly be successful if they do not have regard to culture. Culture is used here in relation to organizational dictates (organizational culture) and the lifelong ethnic/traditional values or dictates which form the basis for socializing employees in their communities. While the former is specific to organizations and is therefore transient, the latter, also referred to as national culture, has some form of permanency in its influence on the human being who is here regarded as the employee for the purposes of the discussion. Studies by Hofstede (1980) and other scholars attempt to explain, or perhaps provide the basis for popularizing, the belief that when organizations exhibit divergent values, notions, and beliefs, they are likely to experience differences in performance. The essence of such organizational cultures as an analytical apparatus in examining performance is rooted in the observation that the emergence of countries such as Japan, China, Singapore, and Malaysia in the global economic scheme of things is perhaps based on some national/traditional cultural imperatives. In other words, if culture is crucial in explaining success of the so-called Asian Tigers, for instance, then it follows that organizations could also develop their own culture to propel improvement in performance. The relationship between traditional culture and performance management is discussed first, followed by organizational culture.

Every human being is born into a cultural context which defines his or her way of life. Culture influences people's choices and how they respond to situations. It is therefore ridiculous, even impossible, to expect employees to completely shirk their cultural identity in favor of a wholesale adoption of a new way of life. Unfortunately, studies have found out that most of the performance management systems implemented globally, especially in developing countries, have little regard to the traditional cultural values of organizational members. This obviously has implications for the effectiveness or otherwise of such systems. For example, although modern organizations purport to thrive on the Weberian bureaucratic principle of impersonality in decision-making, the sense of communality inherent in most cultures makes such expectations wishful at best. Within the African context, for example, it has been found out that appraisal systems hardly provide a true picture of performance since informal connections or relationships override organizational expectations, not least because managers are unwilling to provide information which they reckon could deny their subordinates the right to promotion and other organizational incentives. The point is not to project a rigid or impenetrable cultural climate which is not receptive to positive influences needed for growing modern organizations. Rather, it is important for managers and leaders of today to see divergent cultural backgrounds of employees as a strength to be harnessed rather than a weakness to be overcome.

The extant literature on organizational development and corporate governance has also emphasized the importance of ethics to the growth and sustenance of both public and private sector organizations. Previous notions of ethics disregarded, or supplanted, traditional ethical values in favor of the so-called best practices. The belief was that cultural values were inimical to the growth of modern organizations. This rather mistaken assumption has also found expression in prevailing performance management systems. However, it is now evident that attempts to detach employees from their culture often leave them rather alienated in ways that complicate how they are able to imbibe the so-called new cultures needed to aid their performance in organizations. Some national and organizational-level studies have argued that there are visible signs of "ethical breakdown" (Dwivedi et al. 2007) which have had deleterious consequences on organizational performance. Findings from studies funded by international organizations such as the IMF and the World Bank have revealed prevalent cases of corruption, bribery, moonlighting, and other cases of ethical misconduct in the public sector especially. Attempts to address these ills in organizations through dissemination and training workshops have yielded very little impact. Part of the reason for this state of affairs is that employees often see the so-called ethical principles catalogued in training manuals as not only an imposition but also mere wishes which have no practical relevance. In view of the above, there is a call for the reintegration of traditional ethical values, in effect culture, in performance management, development management, and every facet of national or organizational operations. There is no doubt that traditional cultural values could influence the quality of organizational culture in order to create the right environment for the implementation of an effective performance management system.

By organizational culture is meant the experiences, values, and expectations developed over time by the organization both in relation to its internal actors and its interaction with those outside the organization. Several scholars, including Schein (1985), have attempted to model or conceptualize organizational culture or identify some dimensions of culture which could aid the understanding of organizational culture. But most of these approaches essentially identify some values or shared meanings that influence organizational decision-making and response to situations. While some of these shape the responses of organizational participants in visible ways, others are implied or tacit. In effect, organizational culture is how the organization operates. This means that the organizational culture determines the nature of decision-making processes and feedback mechanisms. It follows that an organization that does not foster collective decision-making may find it extremely difficult to implement a performance management system of the nature discussed earlier in this section. Put differently, organizations are likely to achieve the expected gains of performance management if their culture provides room for employees to contribute to setting goals or objectives. Similarly, organizational culture that allows employees to make known their grievances without any fear of vilification is better able to provide the right environment for the implementation of performance management systems. While there is pressure on public organizations to assimilate the ideals of the NPM, it is clear that political interferences leave little room for the voices of public service bureaucrats to be heard, much less to challenge management decision without suffering penalties. It therefore follows that to ensure the effective implementation of performance management systems, public sector managers require some mitigating measures in order to prevent or mediate political interferences. Another aspect of organizational culture which can aid or frustrate performance management is the reward systems or incentive mechanisms at play. It is simply not enough for managers to aspire toward raising their productivity or improving the finances of their organization through performance management without also putting in place systems to reward those who can actualize these objectives. Thus, although it is instructive to win the cooperation of employees in every change management process, such as the introduction of performance management systems, it is equally important to recognize that employees are the organization's most "valuable assets." This could

be done through clear communication of the incentives that accompany performance. It should be noted that in organizations where managers are usually fond of reneging on their word, the promise of incentives could elicit little response. Thus, any organization that aspires to an effective performance management needs a culture of trust as the basis for rallying employee to action.

There is a lot to be said for the primacy of culture in ensuring better performance management systems in modern organizations. Conversely, where the right cultural climate is missing, performance management systems could be implemented in a vacuum, serving as a disincentive to the achievement of broader organizational goals. It has also been pointed out early on that some scholars regard culture as "phenomenal or irrelevant" in attempting to appreciate organizational performance (Wilkins and Ouchi 1983: 3). In fact, many claim that there is little or no direct relationship between organizational culture and performance. However, it has also been contended that the contesting verdict on the significance of organizational culture on performance could largely be explained by the differences in methodology, the likelihood of interference of extraneous variables in influencing conclusions of previous studies on organizational culture, and the lack of a universal definition on what constitutes organizational culture.

## Conclusion

Modern organizations must continually change their modus operandi in order to remain relevant in a highly competitive environment as well as meet stakeholder expectations. One means of realizing this goal is by instituting effective performance management systems. This entails a collective effort involving all organizational actors in setting organizational goals as well as monitoring and measuring the implementation of strategies to achieve those goals through effective feedback and incentive mechanisms. While the advantages of performance management are numerous, the latter stands little chance of being effective without recognizing the cultural values that mold the behavior of employees. Nor is performance management likely to serve any better ends if the prevailing organizational culture does not provide the right incentives for employee cooperation and output. These arguments notwithstanding, it has been acknowledged that some previous studies found little evidence of any direct relationship between organizational culture and performance improvement. This, however, does not negate the fact that a good performance management regime stands a better chance of harnessing culture for organizational effectiveness. Clearly, there is an urgent need for scholars to broaden the organizational management discourse by providing more recent empirical basis for conclusions on the relationship between performance management and culture.

# Performance Management in Japanese Local Government

Osamu Koike
Graduate School of International Social Sciences, Yokohama National University, Yokohama, Japan

## Synonyms

Accountability; Bureaucratic culture; Cross-cutting issues; New public management (NPM); Policy evaluation; Results-based management

## Definition

Characteristics and current situation of performance management among Japanese local government.

## Introduction

Measuring performance of organization for better public service delivery is an essential part of recent public sector reforms in many countries (Bouckaert and Halligan 2008; Boyne 2010). It is widely recognized that a "performance management" in public sector reform is an application of new public management (NPM) disciplines that seek economy and efficiency of public organizations through a competitive market for "public choice." A movement for performance management started in the US local governments in the late 1980s and spilled over to non-Western countries including Asian developing nations (Koike 2013). In Japan, in the rise of "bureaucracy bashing" in the early 1990s, public managers were forced to be more accountable to the efficiency and effectiveness of public works such as dams and highways. In the mid-1990s, reform-minded local public managers attempted to change traditional bureaucracy through the introduction of the brand-new business practices of results-oriented management. Then, public-spirited officials criticized that a simple emulation of business model is even harmful to equity or fairness of public service provision. However, a chorus of "value for money" or cost-benefit analysis has overwhelmed traditional rule-bound, process management of the local public organization.

In Japan, as in other industrialized democratic countries, performance management in the public organizations has developed at local level and, then, adopted in the national ministries and agencies (Koike et al. 2007). According to the national survey in 2013, the vast majority of local governments have already established some forms of performance measurement system (Ministry of Internal Affairs and Communications 2014). The main objective of performance measurement is to transform local government from a traditional "input (budget)-based" administration to the "results (outcomes)-based" public management. However, analysis of the current situation of performance management in local government reveals that the methodology remains a measurement of the performance of a small piece of tasks and projects. It suggests that a philosophy of results-based management is not fully understood by local public officials in Japan.

## History of Performance Management in Japan

After the oil shock in the late 1970s, Japanese local government faced a fiscal crisis due to the fall of local tax income. It forced prefectural governors and municipal mayors to promote administrative reforms and "cutback management" consisting of budget cut, personnel reduction, and contracting out of service provisions such as garbage collection. In the age of reform, business-

minded governors and mayors attempted to change bureaucratic culture of local government through the introduction of business management models such as management by objectives and "total quality management (TQM)." However, these efforts were unsuccessful in the 1980s (Jun and Koike 1998).

In 1995, the governor of Mie Prefecture, Masayasu Kitagawa (1995–2003), launched a "project evaluation system" as a core of his administrative reform packages. Project evaluation system is a self-evaluation in which public officials evaluate the cost-effectiveness of tasks and projects of their own, by setting "targets" and performance indicators (Umeda 2000). It targeted all the tasks and projects currently being implemented in Mie Prefecture. As many argued, Japanese public organizations have over-emphasized budgeting and planning but neglected to review their effectiveness (Yokoyama 2009). Governor Kitagawa attempted to abolish a culture of "using up the budget" and "following the precedents," saying that "public organization should learn what the management should be from private sector organization." In fact, a self-evaluation system is a borrowing of management by objectives and TQM in which employees participate in the management cycle of "Plan-Do-See." It was expected that public employees can realize the real cost of public service through the self-evaluation of their tasks and projects. Prior to the introduction of task/project evaluation system, Governor Kitagawa organized the intensive training program for directors and managers to learn the latest business models. In the training program, government officials also studied public management reforms using Osborne and Gaebler's best-selling book, *Reinventing Government* (1992), as a textbook (Umeda 2000). In Mie Prefecture, project evaluation system has introduced in the headquarters offices in 1996 and extended to the local branch offices in 1997. Finally, a total of 3200 tasks and projects were reviewed. The results of evaluation were disclosed to the public through the website of Mie Prefectural government.

A task/project evaluation system of Mie Prefecture made a great impact on the promotion of performance measurement in Japan. In fact, a number of local governments have launched similar self-evaluating systems modeled after the task/project evaluation system of Mie Prefecture. According to the national survey in 2013, all of the prefectural governments, 95% of designated cities (metropolitan cities), and 57.7% of municipalities (cities, towns, and villages) have introduced some forms of "administrative evaluation" system (Table 1).

## Current Status of Performance Management in Local Government

In theory, performance management is divided into three distinctive actions: measuring performance using indicators, evaluating efficiency and effectiveness of projects and programs, and taking organizational actions for results or

**Performance Management in Japanese Local Government, Table 1** Diffusion of "Administrative Evaluation System" as of 2013

| | Prefecture | Designated city | Municipalities | Total |
|---|---|---|---|---|
| Established | 47 | 19 | 994 | 1060 |
| Planning | 0 | 0 | 551 | 551 |
| No plan | 0 | 1 | 177 | 178 |
| Total | 47 | 20 | 1722 | 1789 |
| Diffusion rate | 100% | 100% | 57.7% | 59.3% |

Source: The Ministry of Internal Affairs and Communications (2014), p. 1

Note: In the national survey, the Ministry of Internal Affairs and Communications uses a term of "administrative evaluation." A definition of "administrative evaluation" is "a judgment of validity, achievement, and results of policies, programs, and projects, using clearly defined criteria and indicators, in the time of ex-ante, ex-post, or during the work." Due to the vague definition, the national survey data contains various types of evaluation systems in local government

outcomes (Boyne 2010). Applying this theory to the "administrative evaluation" implemented in Japanese local government, it is safe to say that the most of the Japanese local governments implement a "performance measurement."

Table 2 lists the purpose of "administrative evaluation" in local government. The most frequent answers are "improvement of efficiency," "achieving better results," "changing employees' mindset," and "the establishment of PDCA (plan-do-check-action) cycle" in descending order. It is interesting that the "improvement of planning process" is less concerned. It supports the evidence that many local governments which have introduced "administrative evaluation" are in fact implementing the performance measurement (Tanaka 2009). Quite interestingly, "customer orientation" is the lowest in the list. It is suggested that local governments see the "administrative evaluation" as a tool for internal management rather than a strategy to regain public trust in government by showing how they improve services for the public.

On the subject of administrative evaluation, almost all local governments are absorbed in the measurement of the performance of "tasks and projects." Evaluation of "programs" is implemented in 78% of the prefecture and 84% of designated cities, whereas it is implemented in 47% of municipalities. It indicates that it is difficult for municipalities to engage in the evaluation of programs due to the limited resources.

Do local governments utilize the results of performance measurement? A majority of local government answered that the results of the evaluation are reflected in the budget request. On the other hand, 26.7% of prefectures, 29.4% of designated cities, and 41.2% of municipalities replied that the results of performance evaluation are reflected in the budget assessment by the finance division. It indicates that the central management officers are less positive in the utilization of the results of performance evaluation in the budgeting. This tendency is observable in the other areas of administrative management such as staffing and auditing.

The above findings from a national survey indicate that much remains to be done in the promotion of performance management at local level. As shown in Table 3, many local officials feel the difficulty of evaluation indicators, efficient evaluation, linking evaluation with the budget, and changing mindset of employees. It assumes that a kind of "evaluation fatigue" is spreading among local public officials.

Comparing current status of Japanese performance evaluation with a theory of performance management, it can be said that many of local government remains stalled at the initial stage of performance measurement. The efforts of Mie Prefecture that opened a breach in the development of performance management system in Japan must be fairly judged. However, the evaluation of all of tasks and project is quite burdensome and even harmful for municipalities. In

**Performance Management in Japanese Local Government, Table 2** Purpose of administrative evaluation

| | Prefecture | Designated city | Municipality | Total |
|---|---|---|---|---|
| Improvement of efficiency | 87.2% | 84.2% | 93.4% | 92.9% |

Source: The Ministry of Internal Affairs and Communications (2014), p. 12
Note: Among 20 designated cities, Kyoto, Kobe, and Fukuoka evaluate policies separately from projects, and thus the aggregate data is not consistent with the number of designated cities

general, a task/project evaluation is conducted on a yearly basis. In the beginning of the fiscal year, the frontline staff set yearly goals and targets and evaluate how much they have achieved goals and targets using appropriate indicators by the year end. For effective implementation, those who evaluate tasks and projects must be knowledgeable on how to improve the outcome of tasks and projects. If they are competent, they can select appropriate indicators for the evaluation of outcomes. However, if they lack knowledge on outcomes, frontline staff would select "easy" quantitative targets and goals. After all, they only check the implementation status of the projects.

In the self-evaluation process, it is the planning division or the administrative management division that prepares evaluation sheets for the frontline staff. The evaluation sheets should be tailored to be applicable to the various types of projects and programs. Nevertheless, a large number of municipalities use a standard type of evaluation sheets. It is ironical that new public management criticizes the "one-size-fits-all" approach in the administrative reforms. In Japan, however, a *mimic isomorphism* (DiMaggio and Powell 1983) has prevailed in the performance evaluation.

Another adverse effect of task/project evaluation system is a limitation of scope in the evaluation. Tasks and projects are the measures to achieve objectives of a program, and programs are the constituent of upper-level policy. It requires frontline managers and staff to understand a whole picture of projects, programs, and policies they are concerned. Binding frontline staff to the evaluation of tasks and projects would reduce the scope of performance measurement. In this regard, it is good news that some local governments attempt to link project evaluation with the evaluation of strategic programs. For example, Yokohama city government has assessed the performance of the midterm 4-year (2013–2017) plan. Using a performance rating of A, B, and C, city government evaluates the performance of 36 programs in the fields of public welfare, economic development, urban infrastructure and environment, and safety of community living every year. In 2016, city government compiled the interim assessment report and disclosed to the public. A final assessment report will be compiled in 2018 (Yokohama City Government 2016).

## Future Challenges

In spite of a rapid diffusion of performance measurement system among local governments in the last decade, it is hard to say that a philosophy of result-based management has embedded in the basis of public organization management. As shown in the national survey in 2013, the performance measurement remains burdensome for the most of the local public officials. However,

technical issues are not an essential problem. Rather, problems are deeply rooted in their recognition on the objectives of performance management. Remember that the "performance" is a key concept of NPM reforms. It puts economy and efficiency at the top of public philosophy. In the performance management, the frontline managers and staff are forced to maximize economy and efficiency of public service delivery. In this situation, they must make a judgment of abolition or continuation of existing programs and projects in accordance with a norm of economy and efficiency. However, it is not an easy task for the frontline worker. If the managers see the performance management merely as a convenient tool for budget cutting, it is difficult to gain the cooperation of frontline staff. We have learned that the efficiency is the "axiom number one in the value scale of administration" (Gulick 1937). However, frontline officials do not work only for maximizing technical efficiency. Rather, they are working for the public interests. It arises a question of what can be the incentives for performance management (Swiss 2005). If a manager compels their staff to obey the doctrine of NPM, those who are working for the equity and fairness of public service would be in trouble. It indicates that cultural elements need to be considered in the promotion of performance management in the public sector organization.

Again, the reform of public organization is contingent upon local context. In Japan, the public officials, regardless of positions, move to different offices every few year. It discourages public officials to evaluate the performance of projects and programs that take long time period. In addition, the adoption of decentralized management in the performance management may intensify a bureaucratic pathology of "sectionalism" in the public organization. In a decentralized "silo" structure, it is difficult for line department officers to work across policy boundaries for better outcomes. For effective performance management, specifically in the administration of cross-cutting issues, line managers are required to have "a whole of government" perspective and work together for the shared outcomes (Christensen and Lægreid 2007).

## Conclusion

It would be certain that a performance management can improve the accountability and transparency of local government to some extent. However, there exists a fundamental question of who evaluate the quality of self-evaluation (Wildavsky 1972). In Japan, nearly half of local governments have established the external evaluation committees, consisting of professors, lawyers, and voluntary citizens. These organizations are expected for making performance evaluation accountable and trustworthy. In most case, however, external evaluators only check the validity of self-evaluation reports compiled by the bureaucrat. The function of external evaluators is undeniable. However, before that, public managers need to recognize the power of citizen in the performance management. In case of waste management, for instance, local public managers can set an ambitious goal such as No. 1 in the reclining rate of waste. It could be achieved if they can mobilize a large number of citizens for collecting recyclable items. If the local government is ranked at top position among a thousand of local governments, it is a victory for both citizens and local government officials. In the model of collaborative public management, citizens are not just "customers" as NPM doctrine assumes. It would be true that citizens' watchful eyes are a necessary weapon for the quality control of local public services. Collaboration can do more (Agranoff and McGuire 2003). When citizens collaborate with public organizations for better results, the local government can provide high-quality services with less expense. This is what we call a "high performance."

The above discussion reemphasizes that a performance management is a contingent upon local conditions and contexts. It is safe to say that the last decade was a preparation period for Japanese local governments to find a model of performance management. What can be done in the next decade? It is certain that it is difficult for local governments to break through the stagnation without challenging their traditional bureaucratic culture. As Moynihan (2005) notes, performance management is an organizational learning process

(Moynihan 2005). It provides a chance both for public officials and citizens to realize what the true enemy for better results is. It does mean that an introduction of performance management is not the end of the public organization reforms. Rather, it is a starting point for modernizing local governance in the twenty-first century.

# Performance Management in Local Government

Jing Wang
Department of Public Administration, University of Illinois at Chicago, Chicago, IL, USA

## Synonyms

Performance assessment; Performance evaluation; Performance measurement

## Definition

Performance management in local government refers a systematic approach to improving results through evidence-based decision-making, continuous organizational learning, and a focus on accountability for performance for local government.

## Introduction

Developments in local government have witnessed a growth globally in performance management. Performance management has a long history in public administration and management, and it has been an important component of many reforms for transparent, efficient, and accountable government

global wide since the late 1970s. Generally speaking, performance management is a systematic approach to improve results through evidence-based decision-making, continuous organizational learning, and a focus on accountability for performance (Mucha 2009). Today the "paradigm of public performance" includes the two distinct stages: adoption (development of measures) and implementation (actual use of them) (de Lancer Julnes and Holzer 2001; Rivenbark et al. 2016). Local government performance management has developed beyond simple measurement, ranking, benchmarking, and monitoring systems. It is now a process to measure, provide, and use performance evidence to support governmental planning, financing, and operations. More attentions have been paid to the organizational dimensions that promote the use of performance information for actual decision-making, rather than the simple adoption of performance measures.

As the demands of good governance and government accountability have grown, local public managers are increasingly expected to integrate performance management into their jobs. The actual definition and scope of performance management have usually varied among the individuals, organizations, and governments as the practitioners (Mucha 2009). Both normative and descriptive research on local government performance management has a long pedigree. This chapter does not intend to cover the vast literature but to provide a brief overview of the doctrine, current trends, and practices of local government performance management around the world. It starts with the doctrine of performance management, which may provide guidance for the ongoing transition from performance measurement to management in local governments. It is followed by a summary of the challenges to and strategies of local government when embracing the benefits of performance management and a conclusion.

## Performance Management Doctrine

The philosophy and doctrine of performance management have been influenced by several schools of thought including the New Public Management (NPM), "reinventing government," "managing for outcomes," and "managing for results" (Ammons and Roenigk 2015). It advocates the focus on mission and results of managements, rather than the inputs and compliance of rule-bound bureaucracy (Ammons and Roenigk 2015; Kettl and Kelman 2007; Moynihan and Pandey 2010; Osborne and Gaebler 1992). The followings are summarized by Ammons and Roenigk (2015) as the elements of performance management doctrine. Presumably, these are the practices and organizational conditions for successful performance management at local level.

- Clearly defined goals
- Relevant and actionable performance information
- Emphasis on results or outcomes than on inputs and procedural compliance
- Engagement of executive and legislative officials in priority setting, performance monitoring, and data-based decision-making
- Top executives' engagement in frequent monitoring of departmental performance, and frequent feedback, but intervention in operating decisions only when necessary
- Devolved decision authority, with operating decisions made at the departmental or program level rather than by the top executives or central administrative officials
- Managerial flexibility of financial and human resources, and accountability for results
- Performance-based incentives and possibly sanctions (Ammons and Roenigk 2015, p.515–516; Moynihan 2008, pp.31–32; Sanger 2008)

In practice, many of these elements of the doctrine are interrelated and mutually supportive. Importantly, these prescribed practices emphasize the role of the managers in performance management, which can be explained by the aphorism in simple terms: "Let managers manage; make managers manage" (Ammons and Roenigk 2015, p.516). To advance toward the desired results and organizational objectives, managers and

supervisors should have the authority, flexibility, and discretion to make the wise decisions.

Nevertheless, current research on drivers and determinants of successful performance manage is still "in its infancy" (Sanger 2008, p.81). Empirical evidence of the impact of doctrine on local performance management practice is mixed – substantial in the case of some of the elements but much less in others. For instance, Ammons and Roenigk (2015) found mixed conformity with doctrinal prescriptions for manager's role in their study with a sample of American cities and counties who had been recognized for their performance management efforts. Decentralized decision authority was found in most cities and counties, while executive's regular engagement in performance monitoring was only practiced by a little more than half of the governments in the sample (Ammons and Roenigk 2015). Due to their specific situations, few local governments were found to have adopted the full package, but some combinations of prescribed practices in the doctrine. It implies that more compelling, evidence-based research of the doctrinal prescriptions will be needed to provide guide for local governments, especially during the times of transitions.

## From Performance Measurement to Management

One of the important transitions is from performance measurement to performance management. While performance measurement and performance management are sometimes used interchangeably, the literature of local government management is clear that performance measurement comes first, and there are ongoing reforms globally to shift from measurement to management (de Lancer Julnes and Holzer 2001; Rivenbark et al. 2016). The modern push for performance measurement systems in local government in the 1980s and 1990s has set the stage for performance management (Rivenbark et al. 2016). New Public Management (NPM) and Reinventing government had a major influence on the adoption and advancement of performance measurement systems in local governments, especially in Western countries like the USA, UK, Germany, France, and Italy (Gardner 1998; Kuhlman 2010; Osborne and Gaebler 1992). Today many local government entities have adopted tools to measure inputs and outputs, efficiency and effectiveness of their operations, and public services.

Compared to the now widespread performance measurement among local governments, the practice of performance management – the actual use of performance information to improve decision-making, operations, and services – is far less prevalent (Rivenbark et al. 2016; de Lancer Julnes and Holzer 2001; Sanger 2008). For long, early practitioners of performance measurement at local level who effectively tracked the objective measures have been frustrated that their efforts of monitoring performance did not yield the benefits as expected. What is equally important as effective measurement is an integrated management process to apply the indicators to decision-making and organizational advancement.

Making the transition from performance measurement to performance management is not an easy job. Most of these progresses have been noticed in large cities (with populations of 25,000 and above) across the countries, while there are relatively fewer smaller cities who have taken this move (Rivenbark et al. 2016). The literature on performance management have identified the organizational dimensions that need to be present in local governments for the transition from measurement to management. Successful performance management requires an overall assimilation of performance management values and principles into the culture of the organization (Mucha 2009). As being demonstrated in empirical studies, to facilitate data use in local government, one needs to effectively integrate the performance measurement system with other key management systems, such as the planning, and annual budget process (Ammons and Roenigk 2015; Jansen 2008).

## Challenges and Strategies

The operation of local governments are usually quite routine with problems and organizations

small in scale, and communications through traditional means. Compared to higher-level governments which are characterized by policy uncertainty, the routinization of local government should have better facilitated performance management. However, performance management in general has not infiltrated local governments to the same extent as higher-level governments (Hall 2017).

Performance management are more widely practiced by local governments in Western countries, but often in a manner more ceremonial than instrumental. In some cases, it is driven by legislative requirements and coercive pressure from higher level of governments. This has led to discontinuity, delays in implementation, and criticisms from staff and citizens (McAdam et al. 2011). Local performance management also faces various challenges in developing countries. Local governments in some countries (e.g., Uganda) are still in early stage of measuring inputs and outputs, while in other countries (e.g., Malaysia and Indonesia) there is discrepancy between policies and practices of the implementation of performance management at local level (Jurnali and Siti-Nabiha 2015).

Studies have identified and put thoughts on a series of challenges and barriers for local governments in successfully implementing performance management (Hall 2017; Kuhlman 2010; McAdam et al. 2011). By analyzing the capacities local governments need for performance management, Hall (2017) provides a comprehensive list of challenges they face: insufficient financial and administrative capacities, insufficient economies of scale, absence of comparable entities for benchmarking, inadequate strategic planning, complexity of task and implementation environments, strings attached by higher-level governments, and the illusion of control created by proximity to decision makers and citizens.

These challenges call for comprehensive strategies and incremental processes for capacity building in local government. The following steps presented by National Performance Management Advisory Commission are representative of the strategies local governments have used to realize and sustain the benefits of performance management (Mucha 2009).

- Present the case to the appropriate decision makers to obtain support, authorization, and resources
- Identify key goals and objectives of initiating performance management
- Define specific management processes, including planning, budget, measurement, accountability, reporting, information use, and monitoring
- Communicate the plan with stakeholders to gain understanding and support
- Build organizational capacity through training, hiring, or developing in-house technical expertise with supporting tools and technologies

## Conclusion

It is a constantly evolving process for local government to adopt, implement, and institutionalize performance management and to realize the benefits of an integrated system for efficiency and accountability. It is evident that a well-founded system of performance measures, which has fully integrated in the management process of the local government, can considerably stimulate the improvement of performance and strengthen the organization's focus on results. Performance management represents a shift from what many governments are used to, which is particularly difficult for local governments with limited capacity and resources. Local governments benefit from incremental rather than radical changes, as the latter may provoke resistance and abandonment of the performance management (Yetano 2013). Current reform efforts may have focused on quantitative measures and their applications, but it ignores the importance of the quality that needs to be judged in the public realm. It is necessary to recognize the imperfections and limitations of the performance measures. Fully satisfactory measures will shift as the political debate and local situation develop (Gardner 1998).

More research is needed to identify the factors that promote the transition from performance measurement to management, and sustain the benefits of the change. They include, but not limited to, leadership, organizational capacity, information availability, higher-order measures,

organizational culture, and citizen involvement. International comparative studies and case studies of best practices in both developed and developing countries also have the potential to expand the understanding of performance management at local level.

## Synonyms

Performance agreement; Performance contract

## Definitions

*Accountability*: managers are held responsible for carrying out a defined set of duties or tasks, and

for conforming with rules and standards applicable to their post

*Goal*: the result or achievement toward which effort is directed

*Inputs*: factors that are exogenous in the framework comprising capital and labor

*Milestones*: sub-objectives or stages into which a program or project is divided for monitoring and measurement of work performance

*Objectives*: the purpose for which information is required, stated within the context of the program, research problem, or hypotheses that gave rise to the need for information

*Outputs*: goods or services produced by government agencies

*Outcomes*: the impacts on social, economic, or other indicators arising from the delivery of outputs

## Introduction

The purpose of this chapter is to provide insights into the underlying principles of performance management in the field of public administration and to illustrate some of the implications of those principles through an examination that uses public higher education sector as a case study. In the western world, contemporary public sector service delivery is governed and monitored through performance management activities for the purposes of planning, budgeting, funding, resource allocation, and accountability (Taylor and Baines 2012). Performance management systems are based on performance targets and measurements gathered in all types of public sector organizations (Pollitt 2006; Pollitt and Bouckaert 2004). Performance management is close to the ideas and principles of new public management (NPM), which is part of an effort to make the public service more effective, efficient, and market-specific. Performance management is in this context a vehicle used to reform the delivery and management of public services (Pollitt and Bouckaert 2004).

A public sector performance management system typically includes three elements:

1. The establishment of goals and targets, which are called performance milestones
2. The monitoring on progress toward the set targets, which is done using a performance monitoring system
3. The accountability, which is accomplished by the use of a performance reporting system

The governance and the performance management both focus on outputs and outcomes. In all of the above three elements, it is crucial to identify outputs and outcomes for the specific public service that is being examined. Performance agreements have been introduced as performance management tools to support the change of focus from inputs to outputs and outcomes and to clarify the set agenda. From the viewpoint of individual government agencies, this implies establishing performance milestones as a means to demonstrate that they have a clear agenda within which to work. Accordingly, the agreements define the services that public organizations will provide for society across a given period of time. They set out a planned framework of goals, objectives, and standards through which a public organization accomplishes and develops its services (Hope 2013). The agreements specify performance goals and targets for the future, support the monitoring of performance during the agreement, and serve as accountability mechanisms for the various stakeholders.

## Performance Agreements as Performance Management Tools

Performance contracting defines a common performance management framework along with the legislation, public funding, and governmental policies and strategies under which public sector departments and agencies must operate. Performance agreements indicate current priorities and provide guidance for long-term planning. They most commonly cover periods of time between 3 and 4 years. Naturally, performance agreements vary in different countries and might vary between different sectors and different periods of time. This results from the differences in the political system and traditions that exist when the performance agreement is drafted.

While there are clear differences between the possible formats and the scopes of the performance agreements, their purpose is always the same from the performance management perspective. A commonality for all performance management agreements is that they serve as a channel for informing and guiding public sector organizations about governmental policies with the purpose of maximizing the success of public services and their benefits to society. From the accountability perspective, they also serve an important role by defining and specifying the administrative agencies that are ultimately responsible for achieving the public goals and targets.

### Performance Goals and Targets

Performance agreements in the higher education sector clarify the relationship between universities and governmental authorities. Goals and targets are a part of the contractual performance agreements and include both university-specific goals and the policy goals for higher education that are set by the national government. The university-specific goals are associated with the core functions of higher education institutions including education, research, and third-mission activities (de Boer et al. 2015). Performance goals can be categorized as quantitative and qualitative goals. They can also be divided as resource- or operation-related goals, which would be determined using an input-output framework (Pollit and Bouckaert 2004). They can also be organized into descriptive and normative goal statements if only the operation related goals are being examined. The importance of performance goals rests in the extent of control the government exercise regarding the universities and their functions.

Performance agreements most commonly have the following goals:

- Establishing the regular and collaborative dialogue between the government and the higher education institutions with the intention of encouraging the implementation of national agendas, policies, and activities
- Improving the efficiency of the operations by specifying performance goals, targets, and indicators in regard to higher education operations
- Informing policy makers and the public at large on the performance of higher educational system as a whole and at the individual level for each higher education institution in regard to the returns obtained for the allocation of public resources, which allows for improved accountability and enables benchmarking across institutions as well
- Encouraging higher education institutions to strategically reflect on their own performance on both a national and international level

The formats and the contents of the performance agreements are not as important for the governance of the system as the degree to which the institution and the entire system is steered and improved in response to the evaluation process. As in other policy areas, performance goals and targets are not always linked to financial consequences. However, in public higher education, increasingly public institutional grant allocations for research are allocated to universities based on their past performance in regard to research. One common way of measuring this is to set targets for the universities in regard to the relative share of research funding that they are able to obtain from external sources as an indicator of their success. This relative success will then influence the level of public institutional allocations for the next agreement period. Other common goals and targets are related to the delivery of a quality education, internationalization, educational export, and cooperation with external partners.

As a part of the performance management, it is common to establish key performance indicators (KPI). These goals can be operational or resource-based goals and are for the most part quantitative. They establish important milestones for managing the functions of public organizations.

In the higher education sector, the dominant KPIs are input and output factors. KPIs, accompanied with financial incentives, imply rewards will be given for a good performance, and sanctions will be given for a low performance. Examples of KPIs in education are the number of students, who are successfully completing

degrees at both the undergraduate and graduate levels. Research-related KPIs might include items such as the number of faculty, who have had work accepted by international publications, the number of peer-reviewed research articles that have been produced, and the volume of competition-based research funding that has been obtained. Third-mission goals are innovation performance measures and emerge from indicators such as spin-offs, patents, consulting services, partnerships with small- and medium-sized enterprises, and networking with national and international partners with the aim to achieve long-term strategic partnerships. International university ranking lists provide platforms that allow institutions to compare their performance globally. This increases competitive pressure to improve and to indicate positive performance that has been determined by measurements.

### Performance Monitoring

Performance monitoring is aimed at providing the government and the wider community with information about the effectiveness of the delivery of public services. In the context of the higher education sector, monitoring the performance at a national level can prove challenging for all governments. Despite the vast diversity within and between countries in relation to the differences in the political systems and the maturity of their institutions, the trend over the past three decades is to standardize measurements of performance to demonstrate social and economic relevance and international competitiveness for these higher education institutions (Meek and Davies 2009). One of the most common criticisms to these measurements are that they are riddled with several methodological difficulties since they are, for the most part, oriented toward capturing input and output measures and fail to capture essential qualitative dimensions that also influence the potential for the system to effectively perform (Shih-Chang and Whittington 2011; Harman and Treadgold 2007).

Often, the monitoring of the performance of the higher education system is organized into two separate policy areas. The first area is concerned with measures such as throughput rates for students, learning outcomes, students' attitudes, employability, and such. However, the second area focuses on research performance, which often also includes innovation and commercialization of the research efforts. The challenges with these two approaches is that higher education institutions are treated as two separate realities; one in which teaching and learning takes place, and another where research and innovation occurs. While this approach reflects the different policy portfolios and makes sense from a public policy perspective, it makes less sense at the institutional level because they are attempting to deliver various functions, which often are embodied by a core cadre of academic staff.

Increasingly, a significant driver of higher education institutions is to enhance their reputational value and to improve the position of their institution at both a national and international level. Even though teaching and innovation as a third-mission activity are core functions of higher education institutions, the development of a strong research profile is also paramount, not only for the mission of the institutions but also for its status and long-term survival (Hazelkorn 2015, p. 304).

Despite the rhetoric that performance monitoring at the whole system level is geared to ensure accountability of public resources, there are several inherent challenges with the current approach that are difficult to overcome. The fundamental principles of NPM (new public management) stems from a mindset of distrust and a philosophy that the measurement of progress can improve management practices, save resources, and lead to an increase in efficiency and effectiveness (Van de Walle 2011). For the higher education sector, this is particularly challenging in regard to research since these principles stand in contradictions to what is required for supporting and developing a strong research environment. Research, by its very nature, is unpredictable and moving in unforeseen directions with unexpected consequences. Further, it is this unpredictability that often gives rise to some of the most important outcomes. One of the fundamental underpinnings of applied and basic research is a sense of collaboration and trust. From this perspective, it does not lend itself to control and management. Thus,

the establishment of individualized KPIs and the focus on output and input measurements may discourage collaborative efforts, prevent synergies between various functions of higher education, and lead to risk aversion. For example, often research performance is of relative higher importance than other measures, and hence academic staff may be reluctant to engage in commercialization activities as they may be uncertain, time-consuming, and as a result may slow down the research performance. This may be significant in the cases where research performance and the ability to raise external funding for research are linked to the researcher's continued employment.

### Accountability

Performance-based accountability means evaluating the progress of performance toward the set targets and goals. Accountability is a relationship between A and B; in this relationship, A is responsible for indicating its results to B on certain specified performance results. Evaluating performance results requires appropriate evaluation criteria. The use of performance agreements establish the performance goals and targets that will be used as performance criteria. Performance results are evaluated by using performance information as compared against the specified performance targets and goals. Performance information is typically seen as an input that defines future performance management and accountability. This requires relevant information, and reporting and monitoring systems that support accountability. This also requires that managers are able to analyze and interpret performance data related to performance goals, use various types of performance data (both financial and non-financial) and develop initiatives to improve overall performance results, provide policy advice, and improve the service delivery.

In higher education, performance-based accountability emerges in different dimensions; financial accountability, operational accountability, and social accountability. Accountability also emerges in different forms; input-output relationships, better processes, better structures and cultures, and an ideal state of affairs. As a part of evaluation of performance, each higher education institution is responsible for its performance and reporting to a wide range of stakeholders. However, the current focus on input and output measurements as a means to ensure accountability of higher education institutions in regard to their expected delivery of a high-skilled work force to the labor market and new scientific knowledge to the society is problematic. This results from the fact that for the most part their performance is based on quantitative measurements rather than considering the contextual factors that reflect differences in culture, governance, and maturity that exist for the different higher educational systems.

## Conclusion

Performance agreements can enhance the performance of a public service, but they do not guarantee better performance in public administration. The public higher education sector served here as a case example for a public sector that operates under the performance management system.

The higher education sector faces demands and expectations from both the political and social communities. In this rapidly changing competitive world and volatile political environments, it is necessary to develop and apply management frameworks that support the setting of priorities, the adequate allocation of resource, and a comprehensive understanding of how to relate to uncertainties and manage risks. Within these contexts, public higher education institutions are expected to strive toward politically motivated goals. Formalized contracts are used to incentivize higher education institutions, similar to the way that they are used with other public sector organizations, and to achieve the required performance levels that aligns with the political goals. Performance agreements establish the measurement-based and time-related tools to evaluate and manage the core functions of higher education institutions. This is a rational stimulus and effect style management approach.

Performance management tools are expected to improve performance, and this is a reason why they have been implemented in the first place as a performance management tool.

However, the perceptions and preferences within these higher education organizations are critical, especially those held by the managers, leaders, and employees. Performance agreements and also employment contracts are often accompanied by financial rewards and sanctions. This implies that there are negative or positive financial consequences or other negative responses if the performance targets set in the performance agreement are or are not achieved across a given time period. Higher education employees experience and perceive these performance management tools and their effects. Employee perceptions are critical to the success of performance management (Jacobsen and Andersen 2014). If the effect is perceived as positive and motivating, there are possibilities to improve performance based on extrinsic factors such as institutional performance agreements or individual performance-related employment contracts. However, if employee perceptions are mostly negative and seen as control-related, performance agreements do not necessarily enhance performance or encourage bottom-up innovations.

The effectiveness of qualitative and non-financial KPIs used to improve performance and develop accountability mechanisms is challenging to define in the higher education sector. Another aspect that needs to be considered is if it is relevant to apply the same KPIs across the entire higher education system within a particular country. If universities could choose some of their own KPIs, this might provide the necessary stimulus to create more autonomy and allow for the consideration of institution-specific profiles and strategies that take into account contextual variations.

## Introduction

A global movement of new public management which emerged in the 1980s is characterized by outsourcing the production of public goods and services to private organizations (Denhardt and Denhardt 2000; Haque 2007). Privatization advocates argue that governments will receive better services at lower costs because of the expertise and innovation of private service operators (Van Slyke 2007). Under the influence of new public management and neoliberalism, there is a convergence toward outsourcing social service production to third sector organizations such as nonprofit organizations and social enterprises. For example, in the UK, The Public Services (Social Value) Act 2012 calls for all public sector commissioning to factor in social value and was designed to open up more opportunities for social enterprises to win bids for the delivery of public services.

Previous research on government sourcing decisions focuses on transaction costs related to service characteristics, particularly asset specificity and contract management difficulties (Brown and Potoski 2003; Hefetz and Warner 2011). Transaction cost economics is used as a decision heuristic in make-or-buy decisions (Williamson 1981, 1985). While asset specificity concerns the risk of increasing bargaining power of earlier service contractors and monopoly in subsequent transactions, volatility of service demands and ambiguity in service delivery pose challenges to contract specification and performance evaluation (Brown et al. 2015; Carson et al. 2006; Geyskens et al. 2006; Hefetz and Warner 2011). High asset specificity and contract management difficulties render in-house production more preferable than contracting out (Girth et al. 2012; Hefetz and Warner 2011).

Social services are characterized by high asset specificity and contract management difficulties. For example, nonprofits' specific assets such as community networks and clinical expertises render the supplier market noncompetitive. Moreover, due to changing social needs, fluctuating service demands and less quantifiable wellbeing change and social service contracting faces difficulties in contract specifications (i.e., program design, output and outcome metrics) and performance evaluation. Moreover, at the early stage of program development when theory of change is yet to be articulated, setting fixed output targets (e.g., enrollment rates) and specific outcome metrics (e.g., observed change) might be misleading.

As a result, performance management becomes a system to monitor the delivery of social service contracts but does not necessarily ensure the effectiveness of service programs. As public procurement of social services increases, public funding has become an important funding source for nonprofit organizations. Due to resource dependence, nonprofit organizations are susceptible to mission drift, and communities and users' interests might be further underrepresented in service development. Therefore, the question of how to manage service performance lies at the core of understanding social service contracting and collaborative governance.

## Collaborative Governance and Collective Impact

As proposed by Emerson et al. (2012, 2), collaborative governance entails processes and structures of collective decision making and management that "engage people constructively across the boundaries of public agencies, levels of government, and/or the public, private, and civic spheres in order to carry out a public purpose that could not otherwise be accomplished." This definition does not limit collaborative governance to only formal, state-initiated arrangements, and it also encompasses community-based collaboratives providing social good. In view of increasing role of civil society actors in social service provision, effective contracting necessitates a performance management paradigm, which is conducive to collaborative governance of social service provision and collective impact.

A common dilemma faced by funders or grantmakers is that they often need to develop impact metrics for programs in which they do not have expertise or for programs, which aim to address emerging or complex issues. Henry et al. (2013, 465) maintain that "performance-based

accountability along with budget tightening has increased pressure on publicly funded organizations to develop and deliver programs that produce meaningful social benefits." Without a dialogue on program design and impact metrics, funders run the risk of imposing program objectives and impact metrics on grantees, which might not only limit bottom-up innovation but also become less responsive to the needs of the users.

There are many funders' networks whereby grantmakers could exchange their learnings on programs and impact metrics. However, without "reality checks" from grantees, the comparison is likely to result in rising performance standards which not only discourage social entrepreneurs from applying for grants but also breeds opportunistic behaviors. An enabling performance management paradigm is needed to facilitate dialogues about program design and impact metrics as well as to articulate theory of change among funders, service administrators, practitioners, and service users. Insights from service users, practitioners, and service administrators that are shared among funders and their networks can benefit more practitioners and service users. It is through this process that good collective impact gets scaled.

## Performance Management Approaches

### The First Three Generations of Evaluation

Guba and Lincoln (1989) discussed the evolution of evaluation approaches. The first generation of evaluation takes a measurement approach whereby individuals are measured with scales and exams in respect of traits, abilities, and the like. The second generation of evaluation takes a description approach of which the evaluand is program (e.g., interventions). This approach analyzes the effectiveness of a program against program objectives. More importantly, it does not dictate what programs and how programs are to be delivered, hence giving more space for program innovation. The ongoing assessment of trials of a program and their improvements is also a process of formative evaluation.

However, at the start of a program, it is often unclear as to what the program is intended to achieve specifically. Oftentimes, program objectives are explicated when people gain more understanding of the root of a problem which a program is intended to address. Making hasty decisions on program objectives run the risk of misleading program development. In response to the insufficiency of the description approach, the third generation of evaluation takes a judgement approach whereby both program objectives and activities are subject to evaluation. Nevertheless, this approach is premised on the credibility of evaluators which might lead to overreliance on experts and professionalization. For example, professional groups organize accreditation schemes and prescribe service guidelines, contributing to the isomorphism of service delivery and putting constraints on bottom-up innovations.

### On the Way to the Fourth Generation of Evaluation

As aforementioned, publicly funded organizations face rising demands for performance-based accountability (Henry et al. 2013). The purpose of evaluation is to develop and deliver programs that produce meaningful social benefits. The first three generations of evaluation offered different tools for program developers but faced three problems, including a tendency toward managerialism, failure to accommodate value pluralism and overcommitment to the scientific paradigm of inquiry.

As for managerialism, evaluators defer to the funders of evaluation or service administrators (e.g., schools, hospitals, social services), where programs are innovated and implemented, in setting parameters and boundaries for the study. The funders and service administrators have the ultimate power to determine what questions the evaluation will pursue, how the answers will be collected and interpreted, and to whom the findings will be disseminated. Evaluators might also be incentivized to ignore the input from other stakeholder groups and conduct the evaluation in ways that gain manager's approval which is likely to lead to other contracts and ensure a steady source of income. It is hence less likely for the

first three generations of evaluation to be open to inputs and values from other stakeholder groups.

Scientific paradigm of inquiry arises as a result of criticisms toward the failure to accommodate value pluralism. Nonetheless, the surging popularity of evidence-based practice (EBP) in social service provision also favors the utilization of the output/outcome-oriented approaches in measuring performance. According to the hierarchy of evidence central to EBP, Randomized Controlled Trials (RCTs) is the rule of thumb in producing best evidence. However, RCTs are most likely implemented in more controlled settings, such as universities and laboratories, because no service providers could ethically suspend a random user from having necessary services so as to carry out RCTs. While services are subject to the pressure of using best evidence and demonstrating effectiveness, output/outcome-oriented approaches are desirable tools as they help ensure the performance is measured against the expected output/outcome of well-tested interventions that are trialed at universities, laboratories, and research consultancies.

Focusing on output/outcome metrics to guarantee a cookbook application of best evidence is problematic (Frost 2009). It dismisses the idiosyncrasy of practice and the relevance of evidence as judged by actors in the networks (Gray et al. 2009). The relevance and workability of an intervention depend not only on how well it is tested scientifically but also how it is taken up in the actual service settings where multiple stakeholders are involved in defining problems and deciding what counts as good outcomes. An awareness of the need for participation of stakeholders is reflected in the fourth generation of evaluation which is featured by "negotiation" (Guba and Lincoln 1989).

The fourth generation of evaluation provides a constructivist-based process of negotiation among stakeholders which in theory: (1) attempts to help them reach consensus about their reality or to recognize discrepancies; (2) is educational because it provides stakeholders with the opportunity to incorporate others' perspectives of the construct into their own; and (3) is empowering because the entire process is built on negotiated stakeholders' construction of evaluand. Moreover, the question of whose values and priorities would dominate in an evaluation or how value differences might be negotiated have post a challenge to the first three generations of evaluation. As well put by Guba and Lincoln (1989, 34), "it was easy to overlook the fact that even the development of an 'objective' instrument involved value judgments, or that the delineation of objectives implied value agreement, so long as the question of value differences was not raised." In response to the problem, it has been argued that scientific methodology used in the evaluation could somehow render setting program objectives and performance metrics as well as selecting measurement tools value-free.

Therefore, performance management is not merely for monitoring performance and demonstrating effectiveness, but a mechanism that fosters collective learning and continuous improvement. In other words, collaborative governance in social service provision necessitates a performance management paradigm which sets principles and provides institutional frameworks for funders, service administrators, service practitioners, and users to negotiate in respect of evaluation goals, methods and impact metrics, and to forge partnership among these stakeholder groups to contextualize external evidence with their local knowledge and improve practice with local evidence.

## Realities of Social Service Provision

A performance management paradigm for social services should first recognize the realities of social service provision, namely, (1) multiple stakeholders and value pluralism and (2) diverse service delivery contexts and variations in the practice. Accepting these realities of social services allows us to venture the applicability of participatory evaluation in performance management and to discuss the potential for it to contextualize practice in theory (i.e., external evidence) with local knowledge of diverse stakeholder preferences and service delivery contexts.

### Multiple Stakeholders and Value Pluralism

Social service provision involves multiple stakeholders in design, delivery, evaluation, and review, including policy makers, funders, service administrators, service practitioners, and users. This reality renders the field of social service delivery highly dynamic and necessarily pluralistic in terms of value and practices. Values upheld by different stakeholders determine what concerns and issues "should" be addressed (Guba and Lincoln 1989), as well as how well a service is performing. Effectiveness as defined by achievement of "intended outcomes," which are largely devised by service providing end, has received criticisms for ignoring the views and experiences of the service receiving end in determining effectiveness. "What is effective and for whom?" poses questions on the conventional provider/researcher-led evaluative research in performance management.

Wider stakeholder participation, particularly users who are usually less involved in the design, delivery and evaluation of social service, is needed in order to ensure aligned understanding of effectiveness across different stakeholders (Croft and Beresford 1996). Beresford (2000) argued that service users are better placed to generate critical questions and knowledge claims about received beliefs in social service than outside academics and practitioners because they are on the receiving end of the service and knowledge produced out of it.

Service effectiveness achieved through imitating the medical model of evidence-based practice is therefore deemed to be partial. It marginalizes the role of service users in the process of evaluating on the one hand, and on the other hand ignores how knowledges are practiced by practitioners in the context, in order to bring about changes in relationships with the service users. This "cookbook" approach of evidence-based practice was even criticized by medical practitioners (Smith 2004), and Frost (2009) further contended that reducing the delivery of social services into the replication of a recipe constructed somewhere else was a huge mistake because it ignores the formation of (inter)subjectivity and the continuous negotiation of relationships in its nature (Fig. 1).

### Diverse Service Delivery Contexts and Variations in the Practice

Performance management necessitates a good understanding of diverse service delivery contexts which often explains variations in the practice. Performance management thereby concerns not merely how well a service program is executed according to the protocol but also how well it is modified to adjust to the unpredictability and

**Performance Management in Social Service Provision, Fig. 1** Three principles of performance management in social service provision

indeterminacy of the operational/practice context. A practice context is deemed to be dynamic because it is constituted by diverse understandings of practice in theory and in action, as differently performed by the actors from time to time (Schatzki 1996). For example, while funders want to see tangible and measurable results such as increased employment rates, service administrators are concerned about cost efficiency in running programs, and practitioners such as social workers attach more importance to capacity building such as service users' confidence and skills in job seeking rather than actual success rate of finding jobs. Moreover, practitioners may also vary in their approaches to delivering service, depending on contexts such as availability of low-skilled jobs.

Since service delivery guidelines needs to be adapted to changing contexts, it calls for a performance management paradigm which facilitates learning processes whereby discrepancies between program design and local practice reality are examined. Performance management will run the risk of decontextualization if following the guideline of program design takes the priority and "unintended outcomes" are perceived as problems to be managed. Seeing "unintended outcomes" as learning points and unpacking them with stakeholders provide opportunities for contextualizing "what counts as preferable performance" and "how far the service is useful," and hence revision of guidelines and protocols to meet the emerging practical challenges. These attentions to the practice of service delivery depart from traditional theory-informed practice, and support the development of the bottom-up knowledge building and learning from within. Evidence collected from local practices is considered as important as externally generated evidence for improving the practice of social services. By that we start to question "who decides what counts as evidence?," "how should we use evidence?", and "how true is the evidence?."

## Conclusion: The Three Principles of Performance Management in Social Service Provision

The more we learn about the realities of social service delivery, the more we understand that the performance management paradigm for social service provision necessitates participatory evaluation – continuous learning of all stakeholders on the valuation of service goals, concerns and issues, as well as the evaluation of suitability and effectiveness of intervention strategies. As aforementioned, to improve service delivery, participatory evaluation attaches importance to the production of locally useful knowledge and continuous dialogues between practice in action (i.e., locally useful knowledge) and practice in theory (Cousins and Chouinard 2012). More importantly, participatory evaluation promotes social justice, emancipation, and democracy in knowledge and service development.

Participatory evaluation-based performance management is, therefore, to redress the imbalance emphasis on program outcome, by looking at how the "process use" of evaluation can facilitate collective learning and attitudinal and behavioral change of stakeholders (Cousins and Chouinard 2012, 34–37). In some forms of participatory evaluation, the process use is also the end product of the evaluation (Transformative Participatory Evaluation, T-PE). To facilitate genuine participatory approach in performance management, governance arrangements should be put in place that support and encourage (1) stakeholder empowerment, (2) continuous negotiation and collective learning, and (3) transparency and accountability of evaluators.

***Stakeholder Empowerment*** Involving a diverse base of stakeholders in evaluation does not guarantee the process to be "participatory," let alone the product as a reflection of consensus. It is turning a blind eye to the power differences in shaping evaluation agenda, determining issues and concerns to be addressed, identifying and defining the evaluand, formulating methods, accessing performance information, and program decisions that does not only conceal diversities but also discourage genuine participation of stakeholders. The less powerful, usually users and frontline service practitioners as opposed to funders and service administrators may find their views not acknowledged, respected, or taken seriously in the discussion and decision-making. Worse can happen when funders and service

administrators use the involvement of diverse stakeholders to justify their evaluation agenda, rendering the participation of service users and practitioners purely tokenistic (Croft and Beresford 1996).

The evaluator, therefore, bears the responsibility to ensure equal participation of all stakeholders. S/he has to ensure sufficient and transparent circulation of relevant information among all stakeholders, assist the less powerful to speak up/ have a voice in the evaluation process, and create a respectful and stress-free space for deliberation and dialogues. This sometimes involves empowerment of the marginalized stakeholders to challenge how they are conceived by the others. For this purpose, Beresford and Cross (2011) found that independent and self-organizing groups are a useful mechanism for nurturing collectivity and forming collective action for the interests of the less powerful in service development and delivery. For example, evaluators could assist users in forming groups and articulating their diverse experience of change before and after intervention programs. Evaluators could also develop mechanisms such as report cards for systematic collection and sharing of user experiences (Gormley and Weimer 1999).

***Continuous Negotiation and Collective Learning*** Constant balancing of powers among stakeholders sets the foundation for equal negotiation, particularly in case of conflict of interests. It enables stakeholders to feel easier to challenge each other and to unpack the differences in understanding the issues, concerns, claims, and service goals. The negotiated understanding of "what should be done" then guides the choice of mode and means of evaluation as discussed, negotiated, and agreed upon by stakeholders. Guba and Lincoln's (1989) proposal of the fourth generation of evaluation hence appoints the evaluator the role to facilitate thorough discussion of the issue by channeling the different views to different parties, identifying unaligned views, and bringing in missing information for further deliberation.

Equality is imperative to collective learning and solving problems together as it requires stakeholders to contribute their positional knowledge to construct a fuller understanding of the problems (Heron and Reason 1997) and evaluate the usefulness of the solutions (e.g., interventions, service programs). Whereas unequal relationships could steer the negotiation toward the interest of a particular group of stakeholders – service users, service practitioners, service administrators, or funders, resulting in the problems of consumerism, professionalism, managerialism, and patron favoritism, respectively.

***Transparency and Accountability of Evaluator*** Evaluators are obliged to follow transparency and accountability practices, disclosing their financial statements, information on programs under evaluation, program objectives, methods, and impact metrics developed during evaluation. Evaluators should also disclose practices and guidelines they put in place to ensure the implementation of the abovementioned principles. For example, guidelines could entail clear procedures of how to identify stakeholder groups and how information are made accessible to all stakeholder groups. Moreover, there should be a guideline whereby negotiations among stakeholder groups are facilitated in an organized way from setting evaluation agenda, determining issues and concerns to be addressed, identifying and defining the evaluand, formulating methods, to accessing performance information and program decisions.

# Performance Management in the Korean Central Government

Kun Yoon
Department of Public Administration and Policy, Hanshin University, Osan-si, Gyeonggi-do, Republic of Korea

## Synonyms

Performance evaluation; Performance measurement; Policy evaluation

## Definition

Performance management is a series of activities and processes that improve an organization's performance by measuring and evaluating the performance of individuals or departments.

## Introduction

The performance management system's primary goal in the Korean government is to evaluate a degree of performance and offer different incentives accordingly. After the 1960s of the Park Chung-hee administration, the Korean government began to systematically examine and evaluate its work (PMO and CAU 2013). Performance management in Korea has been in full swing based on New Public Management since the IMF crisis in 1997 (Kim and Hong 2013). The Kim Dae-jung administration made intensive efforts to end aid dependency under the IMF's bailout. Launching the new performance management system was one of these efforts.

The Korean performance management system has been developed to manage both organizational and individual dimensions. The Framework Act on Public Service Evaluation (FAPSE) has managed the organizational-level issues, while the Regulations on the Performance Evaluation and Others of Public Officials (RPEPO) has

directed the individual-level issues. Other tools have also assisted to promote the goals of the performance management system, such as a financial performance goal management system of the Ministry of Economy and Finance, an evaluation of the institution's performance report by the Board of Audit and Inspection based on the National Finance Act, and an analysis of major national projects of the National Assembly Budget Office embodied on the National Assembly Act. As the Korean government has continuously advanced the practices of performance management, this chapter explores the Korean central government's performance management approaches with the discussions of its appropriateness and challenges, focusing on the FAPSE and RPEPO.

## Performance Management System at the Organizational Level

Even though the FAPSE defines the principles of performance management and detailed planning, it is fundamentally a law that outlines the evaluation of Ministries' work. It means that Korea's performance management system is closely related to the policy evaluation system. Measuring or evaluating actual performance is one of the key elements of performance management. In that sense, Korea's performance management system can be appropriate.

Before the adoption of the performance management system, Korea's policy evaluation system existed. One of the first attempts is the "audit analysis" system that was legally introduced by the first government of Park Chung-hee in 1972. It was based on the Presidential Decree Regulations on the Planning and Examination Analysis of the Government. An audit analysis under this regulation is a system in which the head of a department evaluates the execution results of the basic operation plan of the department and its affiliated organizations. Quarterly assessments were made, and the results were reported to the Prime Minister. The Prime Minister's Office of Planning and Coordination reviewed and analyzed quarterly major department policies and projects. The Prime Minister comprehensively assessed the results of the ministry's self-evaluation and the results of the review and analysis of the Planning and Coordination Office and reported them to the President through the deliberation of the State Council.

This regulation was amended in 1982 by the Chun Doo-hwan administration. The subject changed from Prime Minister to Minister of Economic Planning. Besides, if correction is needed according to the result of the examination analysis, it can be reflected in budgeting or quarterly budget allocation in addition to correction requests. This regulation was amended again in 1995 by the Kim Young-sam administration. The regulation has been renamed to "Regulations on the Evaluation and Coordination of Government Services." The term audit analysis has been changed from audit evaluation. The subject was changed from the EPB Minister back to the Prime Minister. This regulation was revised again in 1998 by the Kim Dae-jung administration. The "Institutional Evaluation" system was established every year by the Prime Minister to comprehensively evaluate the performance of each ministry and the administrative capabilities of the actors. In 2001, the regulation was converted into the "Basic Act on the Evaluation of Government Affairs." The legislation includes new provisions for auditing evaluation results, reporting to the National Assembly, disclosure of evaluation results, and awarding excellent organizations.

Finally, the law was changed to "FAPSE" by the Roh Moo-hyun administration in 2006 (Shin and Eum 2014). Every 3 years, departments should draw up a "performance management strategic plan" that includes the department's mission and strategic goals. The strategic plan should reflect the national fiscal management plan and report to the higher committees of the National Assembly. In addition, departments should draw up a "performance management implementation plan" each year that includes the department's missions, strategic objectives, performance goals for the year, performance indicators, and financial results for the past 3 years. Performance indicators should be set objectively and quantitatively, and if this is difficult, write them in a different form.

The Prime Minister should ensure that the results of departmental performance management are reflected in self-assessments and specific assessments. The Prime Minister prepares a master plan for the evaluation of government services every 3 years. The basic plan includes the primary direction for performance management and evaluation, development direction, research and development, measures to secure effectiveness of evaluation, professionalism and independence, electronic integrated evaluation system, budget, and organization. Also, a yearly implementation plan is prepared. The implementation plan includes the year's performance management and the basic direction of evaluation, self-assessment, specific evaluation, and public institution evaluation.

The Government Affairs Evaluation Commission, which consists of 15 members (including 2 chairpersons), belongs to the Prime Minister. One of the two chairmen is the Prime Minister, and the President appoints the other one among the private members. Three of the members, excluding the Chairman, are the Minister of Strategy and Finance, the Minister of Public Administration and Security, and the Head of the State Coordinator. The rest are civilian members.

The evaluations consist of self-evaluation and specific evaluation. The specific evaluations are carried out on two or more ministry-related policies, major issues, and innovation management. At present, the specific evaluation is composed of national tasks, regulatory innovation, government innovation, policy communication, and implementation of instructions. In the case of self-evaluation, major policies, financial projects, and administrative management capabilities are evaluated.

Evaluation results should be reflected in the organization, personnel, budget, and remuneration system. The ministry should reflect the evaluation result when the budget is requested, and the Ministry of Strategy and Finance should reflect the evaluation result when budgeting the department. The department conducts its own corrective action and self-audit based on the evaluation result and submits the result to the committee. Based on the evaluation results, the organization or individual shall be given a reward, incentive payment, or preferential treatment in personnel and submit the result to the committee. Evaluation results can be given preferential treatment such as awards and rewards.

## Performance Management System at the Individual Level

Performance management for the central government officials is governed by the Ministry of Human Resource Development and Innovation's Regulations on Evaluation of Officials' Performance, Regulations on Compensation of Government Officials, Regulations on Civil Service Allowance, and others. The Performance Evaluation Regulations established the procedures and standards for evaluating the work of public officials. It was enacted by the Roh Moo-hyun government in 2004 under the name of "Public Official Evaluation Regulations" and was fully revised in 2005.

This regulation requires departments to develop a plan for performance evaluation and performance improvement for their officials every year. Plans include performance evaluations, performance interviews, use of evaluation results, and action plans for those with low evaluation results. It was divided into a performance contract evaluation above Level 4 and work performance evaluation below Level 5.

In the case of performance contract evaluation, the level of achievement of performance targets, evaluation of operational evaluation by the department, and other qualifications and abilities related to job performance are evaluated. The officials to be evaluated enter into a performance contract with the evaluator. In the performance contract, the importance of the performance goal, the difficulty, and the quality attitude of the officials to be evaluated are evaluated.

Work performance evaluation evaluates work performance and job performance ability. In this case, the degree of achievement of the relevant officials' performance targets will be taken into

account. The evaluation factors for each evaluation item shall be determined by the Minister. In this case, consider the position, department, and job characteristics.

Performance targets are set in consultation with the evaluator and verifier. There are three or more evaluation grades, and they are distributed in the highest 20% and the lowest 10%. The evaluator and the verifier submit the evaluation result to the work performance evaluation committee. The work evaluation committee sets the evaluation score, adjusts the results, and processes the appeal.

The evaluator conducts performance interviews with the officials to evaluate, checks the performance of officials, exchanges opinions with the parties on the results of the performance goals, and conducts a performance interview with the lowest grader to improve performance or competence. The evaluator and verifier inform the officials of the results of the evaluation. If there is any objection to the evaluator's evaluation, appeal to the evaluator. If the appeal is justified, the results are adjusted. Otherwise, the reasons are explained. The evaluation results are reflected in personnel management: promotion, training, position management, special upgrades, or bonuses.

The performance salary is specified in the civil service compensation regulations, and the performance bonus is specified in the civil service allowance regulations. Performance salary and bonuses were introduced in December 1998 to enhance competitiveness and productivity in the civil service. The salary consists of a basic wage and performance wage, and performance salary is based on the previous year's performance evaluation results. A performance bonus is paid to those who have excellent work performance and performance for Level 3 or below. Individual, departmental, or a mix of these can be paid.

## The Desirable Future of Performance Management in the Korean Government

Managing the performance of public organizations is vital in achieving its mission. When democratic governments fulfill their mission in public organizations, they ultimately assume responsibility for their people. The Korean government makes this through the government business evaluation system and performance evaluation system. Both systems are very carefully designed and operated. There are many challenges for the sustainable development of Korea's performance management system. For example, linkages between the two systems are one of the critical issues. In a broad framework, the government evaluation system covers this, but the actual operation is separate. Therefore, it is necessary to come up with a plan for the actual operation.

However, this is not the point. The key is the issue of performance management driven by evaluation and incentives. Performance management in Korea is based on the traditional negative performance management system. Considering two theories about the human being of McGregor (1960), basically performance management system presupposes the theory X perspective. The factors that cause human behavior in performance management are external. The relatively good performance gives us incentives. Expectations for incentives determine individual efforts to achieve results. Performance evaluation is not a tool of learning, but rather a means of deciding a person who would be given incentives. It can undermine the autonomy of individual members.

Under the theory Y, performance management can be based on responsibility. We feel responsible for the success of our assigned duties. In order to fulfill these responsibilities, it is necessary to achieve excellent results. Empathy for the organization's goals and missions and love and devotion to the organization drive responsibility for the task given to it, and responsibility ensures performance. If the former is negative performance management, performance management that is based on such responsibility and is voluntary will be called positive performance management.

The major challenge with a negative performance management system is concerned with fairness. In other words, it is challenging to accept evaluation results unless fair performance evaluation is possible. Recognizing that performance

appraisal is unfair will increase the dissatisfaction with the organization, which may obstruct performance improvement. Therefore, negative performance management requires efforts to secure the fairness of performance evaluation. It requires objectivity and expertise in the evaluation. For the objectivity of evaluation, objective indicators are needed rather than subjective indicators. However, it is often difficult to present objective indicators, particularly in public administration, because of the abstraction of goals. The evaluators or criteria should not be different. The same assessor should evaluate individual work and his or her colleagues' work on the same basis. In addition, if the evaluator lacks expertise in the job, the appraisees cannot accept it. It may be acceptable if several professional evaluators present the same evaluation results. However, it isn't easy to satisfy all of these points. Negative performance management, therefore, is fundamentally difficult to solve the fairness issue, which, in turn, is detrimental for performance.

Positive performance management is based on intrinsic motivations, so extreme evaluation is not necessary. Even if the evaluation is made, the meaning of the evaluation does not mean ranking. Evaluation is for learning purposes, and "the past of me" is the standard of reference. Organizational processes are based on autonomous human trust. Since it does not presuppose competition with other members of the organization, a cooperative organizational culture can be formed rather than conflict, which will ultimately strengthen the organization's integration. We can also increase our self-esteem as an organizational member. These factors are positive factors for performance. It, in turn, can lead to unintentional positive externalities by strengthening the publicness of public organizations.

However, monitoring is necessary to hold trust. It can enhance transparency to keep monitoring processes and performances. This information will be provided to the leaders of the organization. The leader will advise members individually based on this information as needed. Of course, it is unclear what the results of this new paradigm's performance management will be. It seems necessary to accumulate cases through experimentation.

## Synonyms

Planning and control systems; Results management

## Definition

Performance management is a management style aimed at setting goals and ensuring that such targets are achieved through a planning and control cycle. It embodies a set of activities, tools, and mechanisms intended to measuring and evaluating results to continuously improve performance.

## Introduction

In the last 20 years or so, public sector organizations have borrowed management practices from the private sector. The pushing argument of *doing more with less*, which have inspired New Public Management (NPM) reforms, brought within the public sector the need for explicit use of standards and measures of performance (Hood 1991). The government of Western countries started to place greater emphasis on output control, reward systems, and results rather than overlooking compliance with administrative rules and procedures. NPM-oriented reforms provided public managers with these new tools for achieving performance. However, the specific complexity of the public sector demands to frame performance and adapt its management tools and methods to such environmental aspects, as well as to implement these techniques by balancing different values within organizations. Following these premises, this work explores the content of performance management in public sector organizations. Initially, the substance of performance is examined along three lines: models, dimensions, and levels of analysis. Then, performance management and measurement are distinguished and described. Lastly, a concluding section highlights central points concerning this performance management in the public sector.

## Performance in the Public Sector: Models, Dimensions, and Levels

### Models of Performance

The meaning of government operations and deliveries has changed over the years as the literature on performance management has recognized (Talbot 2009; Van Dooren et al. 2015; Walker et al. 2010). Academic and practitioners have offered a large variety of frameworks. However they are based on two fundamental models: the "3Es" model (i.e., economy, efficiency, effectiveness) and the "IOO" model (e.g., input, output, outcome) (Boyne 2002). Performance has been described according to two leading perspectives, here commented in turn: performance as production and performance as public value.

The production process model refers to the ability of an organization to turn resources into outputs and outcomes. The production

**Performance Management in the Public Sector, Fig. 1** Span of performance in the public sector: an analytical framework (Bouckaert and Halligan 2007, p. 16)

P

logic – inputs ➔ activities ➔ outputs – can be applied to an institution/organization or a policy program. Such a standard model has been extended (Pollitt and Bouckaert 2011) (Fig. 1) and labeled as "the span of performance" (Bouckaert and Halligan 2007, p. 16).

The analytical framework of performance portrayed in Fig. 1 can be used not only to measure the efficiency and effectiveness of an agency, but it also increases the span of performance measurement and management since it concerns two levels of results: operational result and process results (Pollitt and Bouckaert 2011). Indeed, managers can measure the capacity of the organization to (i) address socioeconomic issues of the context, (ii) deliver services and outputs – even non-transactional ones – to the citizens and to the administered community and its efficacy in doing so, (iii) have an impact on the socioeconomic environment through intermediate and final outcomes. This model assumes as a starting point the societal needs of the environment based on which a public organization endows its system with the requested resources to deliver the planned outputs. Services and products such as the number of authorizations issued by a municipality, school degrees, meals provided to students at a school canteen, surgery treatments, and vaccination treatments are delivered to external users and may generate intermediate and final outcomes on both the targeted users and the social context. Picking some of the above output examples, the time it takes for the municipality to issue the authorization may impact on the current profitability of a business venture, students passing the university admission tests after getting a college degree, and people fully recovered after surgery treatment. All of these outcomes reflect the effects of a policy program on the external environment and – as Fig. 1 portrays – gathering the trust toward the political system. Therefore, the extended production model connects organizational performance with internal and external dimensions of effectiveness and includes the "four types of performance" as recognized by Dubnick (2005, p. 392).

The public value perspective of performance clarifies the substance (Van Dooren et al. 2015) of what is described by the four performance types. Indeed, Moore (1995, p. 10) asked himself how to operationalize the ability of public sector organizations "to create value in the short and long run" or what he called the managerial success. For the private sector, the value created by an organization is measured by the profitability or the stock price (as a forecast of the first), but there is no equivalent for public sector organizations. Public value can be derived from the improved living conditions for the community as a whole, and public sector organizations produce value when they meet the needs of citizens. Public value embraces several disciplines, and it enhances the production model of performance (Voets et al. 2008). To this end, literature refers to the administrative arguments as grouped by Hood (1991). He clustered administrative values about performance into three clusters: economy and parsimony, honesty and fairness, and security and resilience. The first group of values emphasizes output control since they are connected with "the matching of resources to defined tasks" (Hood 1991, p. 12). The second cluster of value is associated with the governance process. A government has to operate in a democratic, honest, fair way. This group of values focuses on the process rather on results as stressed by the production view of performance (Voets et al. 2008). The third group was labeled as "regime" which includes values relating to resilience, endurance, robustness, survival, and adaptivity. This argument indicates the capacity of a public organization to remain active in "worst case conditions and to adapt rapidly in a crisis" (Hood 1991, p. 14).

The public value perspective of performance offers a framework which enhances public governance, with additional dimensions (Boyne 2002) including measures of the citizens participation in public processes, integrity of public agencies, and accountability (Walker et al. 2010), as well as democratic values "like equity, equality, probity, and social capital" (Talbot 2009, p. 501).

## Dimensions of Performance

The discussion on the two perspectives of performance has introduced some fundamental dimensions of performance. Both production and public

value models require measuring performance regarding the use of resources, quality and cost of processes, quality and quantity of outputs, and outcomes achieved by public sector organizations (OECD 2009). Indeed, for public organizations to cover the entire extent of performance, they need a wide range of measures: outputs, efficiency, outcomes, and effectiveness.

The focus of traditional performance measurement was concerned with inputs and processes. Innovations provided by the NPM and public governance agenda shifted the focus of performance management system to the results of such processes, namely, outputs and outcomes. An output configures an immediate result of organizations activity (certificate issued, the amount of money spent); an outcome expresses "everything beyond outputs" (Bouckaert and Halligan 2007, p. 16), the effects, or the impact of these activities on the external context (the fraction of certificated issued correctly, what has been produced with these public spending). The outcome implies an estimation of the worth of what has been delivered by public sector organizations; it proxies the quality of a quantitative output or a volume. "Such a view implies the existence of an identity of the form: Outcome = Valuation (output * quality)" (Smith 2013, p. 2).

Other key dimensions refer to the internal efficiency that measures the ability of an agency in "turning inputs into outputs" (Talbot 2009, p. 499), and it can be associated at the maximum production yield of an organization when operating along its production frontier (Van Dooren et al. 2015). On the other side, the allocative efficiency allows organizations to understand the effect of resources' allocation to a specific policy area. As Schick (1996, p. 87) argued, the "efficiency in producing outputs is not the whole of public management. It also is essential that government has the capacity to achieve larger political and strategic objectives. [. . .] It will have to move from management issues to policy objectives, to fostering outcomes." The ratio between output and outcome can be used as a measure of effectiveness (Bouckaert and Halligan 2007). In the same way, the comparison of inputs versus outcomes focuses on the organizational capacity to address societal requests expressed within the political system.

### Levels of Performance

NPM reforms focused performance analysis at the micro level (i.e., the organizational level) (Voets et al. 2008). However, both the multidimensionality of the concept (Talbot 2009; Van Dooren et al. 2015) and the spread of the emergent paradigm of public governance induced scholar to widen the scale of their analysis. In this sense, the integration of the extended performance model with values of public governance resulted in a "dynamic and variable span and depth of a performance platform for control" (Bouckaert and Halligan 2007, p. 16). Indeed, when assessing performance, three main "levels" of analysis can be distinguished (Bianchi 2010): (i) a political (or macro level), (ii) a managerial (or micro level), and (iii) a political versus managerial conversation (or *meso* level). The first level refers to the national/international scale and implies gauging four types of results (Fukuyama 2013): (i) procedural measures (corruption, tax evasion, gender discrimination at workplace), (ii) capacity measures (taxation, education of public service employee, and professionalization), (iii) output/outcome measure (education scores, GDP, literacy, public health, public security, and national defense), and (iv) bureaucratic autonomy measures (as a response to principal agent theory implications). These empirical measures are examples through which assess and compare the quality of public sector services. However, data may not cover all of these areas making them difficult to measure. Furthermore, main issues regarding the national scale concern the conceptualization behind such performance measurements (Fukuyama 2013). A macro perspective of performance can also be seen, for instance, as the case of a local area that needs to align its strategies with few involved municipalities. One may call this perspective as "interinstitutional" (Bianchi 2010, p. 376) or a "governance wide" (Bouckaert and Halligan 2007, p. 18).

At a micro level of analysis, the concept of performance is mainly associated with organizational results such as output measures of services

or products delivered by a public organization to the society. Organizational performance is customer-focused and expresses the allocation of outputs to specific users or the administered community as a whole. It also has a particular emphasis on the quality of deliveries as well as on the customer service level as effects of the "general quality movement" (Talbot 2009, p. 498). Organizational performance includes elements such as the waiting time for surgical treatment or for issuing a certificate, the quality of the document delivered as gathered through the paperwork error rate, and the adequacy of resources compared with service demand. These elements pertain to departmental or interdepartmental level and substance organizational performance. Therefore, by "mapping products and processes, strategic resources and results" (Bianchi 2010, p. 378), organizations may achieve a certain fit with users' expectation regarding service performance.

*Meso* level analysis refers to three main areas of application (Van Dooren et al. 2015): (i) a policy program (e.g., health care, industrial development), (ii) a value chain leading to products and services delivered to both internal (within the same organizations and across the vertical line of organizational structure) (e.g., the preliminary analysis for public prosecution: from a police officer to a court office) and external customers such as users or the community as whole (e.g., protection and security services), and (iii) a network project (e.g., the strategic plan for a tourism destination).

At this level of analysis, performance is primarily meant as intermediate and final outcomes. *Meso* level results are realized by the network of organizations involved in a specific policy field (e.g., unemployment). Thereby, performance management system must connect the outputs that each organization involved in such a network produced, with both intermediate and final outcomes achieved through the implemented policy at *meso* level (Bouckaert and Halligan 2007).

## Performance Management

Performance management concerns a set of activities, tools, and mechanisms aimed at measuring and evaluating results to continuously improve performance. Performance management systems enable organizations to plan, control, evaluate, and manage performance (regarding outputs and outcomes). Such processes by promoting shared goals and introducing an ongoing based control also allow organizations to improve culture, enhance reporting system, and increase resources productivity. These benefits can be attained only by introducing in an organization a consistent framework embodying all the elements profiling the multifaceted and multidimensional concept of performance.

As classified by Van Helden et al. (2012), the introduction of performance management system within a public sector organization may include four different stages. A construction phase, in which both the system and the extent of performance indicators are designed, follows an implementation stage, which considers tests and empirical experiments. Once the system is up and running, the use of management tools and methods allows organizations to influence its internal units. The subsequent assessment phase concerns a review of performance management system architecture and its internal and external impacts, as well as an evaluation of potential implications for the whole institutional environment where the organization is embedded (Fig. 2).

A cyclical approach to performance management emphasizes that performance management differs from mere performance measurement activities, although in some cases, among politicians and managers, there still exists vagueness about the difference in the meaning of these words. To avoid such an indistinctness, the following two sections deal with performance measurement and management, respectively.

### Performance Measurement

"Performance measurement is a bundle of deliberate activities for quantifying performance" (Van Dooren et al. 2015, p. 32) and is focused on capturing how the organization/policy program is performing with regard to several aspects. Performance measurement requires incorporation of measurement within policy design and management initiatives. However these measurements are frequently weak and crude, since they miss many relevant dimensions of results (OECD 2009).

**Performance Management in the Public Sector, Fig. 2** Pictorial overview of performance management cycle (Smith and Goddard 2002, p. 248)

Indeed it has been termed as "the Achilles' heel in administrative modernization" (Bouckaert and Peters 2002). Furthermore, the way in which public administration makes use of these information has been recognized as a raising question for public management scholars. Selective and smart uses of performance measurement information may enhance performance management systems as a literature review provided by Cepiku (2016) argues. She clustered drivers and effects of performance use in three groups: "characteristics of performance information systems, features of public managers as users of information, and internal and external context" (Cepiku 2016, p. 298).

Additional questions regarding performance measurement relate to the rationale and to the object of measuring. Addressing both issues, Behn (2003, p. 587) identified meaningful performance measures associated with "eight managerial purposes." The extent of performance measurement and its purposes plays a central role in performance management: when deciding what to measure, organizations set up the most appropriate type of control system according to the possibility to measure outputs/outcome and the level of knowledge of the process.

Measurability has been explored since the1960s. Downs (1967) scaled measurability along eight structural aspects of bureaucracy, while Hackman and Oldham (1980) analyzed measurability along two domains: task ambiguity and task routine. They found that when the level of task routine is low and the task ambiguity is high, both give rise to difficulties in measurement. Blankart (1987) identified in the measurability of the quality of public services outputs the limits to their privatization. He clustered quality in three groups: inspection (tangible), experience (predictable), and trust (intangible). Wilson (1989) classified four types of organizations according to the possibility to measure their outputs and outcomes. These refer to production, procedural, craft, and coping organizations. In discussing the measurability of performance within their extended production model, Bouckaert and Halligan (2007) pointed out the existence and the relevance of three level of analysis (macro, micro, and *meso*) as crucial elements of performance measurement.

## Managing Performance

Within the context of public sector organizations, the focus of performance management has shifted from input management (budgets and staffing) or process management (rules and routines) toward achievements accounting (Walker et al. 2010) meant as "managing for results" – driven by NPM reforms (Moynihan 2006, p. 78) – or "centered on programs outcomes" (Heinrich 2002, p. 713). As Behn (2014) argued, performance management requires that an agency provides efforts aimed at achieving a specific public purpose, by eliminating or reducing obstacles to that purpose, setting and tracking targets constantly, and examining performance information and data to understand progress and design corrective

policies. In other words, performance management includes either measurement or monitoring, as well as reporting activities of selective and significant values to administrative and political bodies for allowing them to use this information as input for decision-making. The aim of a performance management process is improving the efficiency, effectiveness, economy, and equity of policy programs, organizations, and services. Its cycle includes activities such as planning, measuring, evaluating, reporting, and implementing corrective actions (Cepiku 2016).

The ambition of performance management is to incorporate information and data regarding results within the policy design and budget allocation activities. Thereby, the purpose of such a management style is threefold: (i) to learn how to improve/change strategy and/or implementation with an internal focus, (ii) to steer and control processes and associated activities, and (iii) to report and communicate performance values to give account of public sector results to the external environment (Van Dooren et al. 2015).

The idea that performance management is required to address problems such as inefficiencies of public sector organizations is widely recognized. However, given the specific complexity of public sector organizations, performance management systems may produce structural dysfunctionalities and behavioral implications (Cepiku 2016; OECD 2009; Van Dooren et al. 2015). Risks associated with performance management systems dysfunctionalities may be an inadequate political and managerial focus on performance management practices and a probability of gaming with measurement and report (Vakkuri and Meklin 2006; Van Thiel and Leeuw 2002). When designing performance management systems, to mitigate such adverse effects, it is essential to well-balanced managerial values, political priorities, and the institutional setting.

## Conclusion

Performance differs from a mere behavior since it includes some degree of intent (Dubnick 2005). It can be conceptualized as "a set of information about achievements of varying significance to different stakeholders" (Bovaird 2008, p. 185). Two approaches define performance: the production model and the public value perspective. Both models of performance stressed the multidimensionality of the tenet in terms of dimensions (input, output, outcome, efficiency, effectiveness, and productivity) and levels (micro, macro, and *meso*). Performance management is a cyclical process through which managers set goals, measure achievements, and use information regarding performance to implement corrective actions and/or to change targets. Since performance measurement cannot be understood as an end per se (Behn 2003), performance management embodies the measurement of results as supporting activities for the control function. Performance management is an effective practice for improving efficiency and effectiveness of the public sector. To alleviate the risk of distorted effects, in designing and assessing the performance, academics and practitioners must enlarge the extent of indicators and the interest of stakeholders.

## Synonyms

Performance appraisal; Performance assessment; Performance management; Performance measurement

According to Hatry (2002, p. 352) "performance management is defined as the use of performance information to affect programs, policies, or any

other organization actions aimed at maximizing the benefits of public services."

Similar to other countries, performance management was introduced in the Brazil's public administration agenda as a result of the 1980's managerialism wave. After elected in the 1994 Presidential Elections, President Fernando Henrique Cardoso put to force a series of reforms in order to make public administration more efficient and for ensuring fiscal equilibrium. The agenda put forward that time was based on the idea of minimum State, management by results, treating citizens as costumers, reducing costs, and improving the quality of public services.

These series of administrative reforms came about in the scope of the "*Plano Diretor de Reforma do Aparelho do Estado – PDRAE*" (Master Plan for the Reform of the State Apparatus). In such plan, public administration would borrow techniques and paradigms typical from for-profit organizations in order to achieve the following ends:

- Fiscal adjustment
- Economic reforms for ensuring internal competition and for creating conditions for facing international competition
- Social security reform
- Innovation of social policy instruments
- Reform of the State apparatus (Bresser-Pereira and Spink 2003)

According to the PDRAE document (Brasil 1995), the reform arose from a diagnosis made over how public administration was carried out in some issues detected such as the role of the State, the nature of public functions which would be rather regulatory than executives, the amount of and motivation of civil servants, public organizations' quality and efficiency for providing public services and policies, and the way citizens are regarded in the public service and policy delivery systems.

Martins and Gomes (2012) suggested that performance management is still being put to practice in Brazil in a disorientated way. There are several initiatives made by different departments from Federal, State, and Municipal governments holding few characteristics from each other. The communal trace seems to be that strategic planning has been carried out with the help of managerial techniques, such as Balanced Scorecard (Kaplan and Norton 1996). From these attempts, public departments create their own performance measurements and approaches in order to follow the wave of making public organizations performing better.

For doing so, this manuscript is structured as follows. In the next section, I do present some theories for explaining the importance of performance management to public organizations; after that, we present empirical works who have dealt with performance management and measurement in Brazilian public organizations.

## Fundaments of Performance Management

The most important issue for devising a good performance appraisal seems to be upon the way people see and manage performance. According to British performance appraisal framework, performance dimensions are efficiency, economy, and effectiveness (Boyne 2002), the so-called 3Es model. Later on, a fourth E was added to the model: equity. For this reason, devising a performance management or measurement model is a matter of making things right, making the right things, making to the right people, and making a difference on people's life. Efficiency is about doing the best with a certain amount of resources in order to produce outputs; economy is achieving the best available resources for the lowest possible price; effectiveness is producing outcomes (better and larger than outputs in terms of providing value to society); finally, equity is providing goods and services to the largest possible market share (Hillman and Keim 2001). Worthy to mention, in Brazil we use the term efficacy for assessing an organization's capacity for achieving the planned targets. Therefore, efficacy is a measure of the extent a target has been accomplished.

It is usual to see public organizations devising performance indicators for attending some legal

frameworks. However, they often leave aside the most important aspect of measuring and managing performance: stakeholders. According to (Freeman 1984), stakeholders are people, group, or organizations able to influence a given organization to satisfying their needs or being influenced by such organizations when trying to achieve their aims. For this reason, a "good" performance assessment framework must take into account stakeholders' expectations and interests (Ogden and Watson 1999).

In the milieu of stakeholders' interest, there are several authors who proposed measures for interpreting their interest and expectations. Connolly et al. (1980, p. 212) proposed "a view of organizational effectiveness in which several different effectiveness statements can be made about the focal organization, reflecting the criterion sets of different individuals and groups we shall refer to as 'constituencies' (stakeholders)." According to them, an organization must be assessed in the way their constituents see them. Berman et al. (1999) argued organizational performance depends upon the diversity of influence stakeholders impose upon them. West and Raso (2012) came about a model for assessing the importance of rulemaking in organization's performance.

We already know that stakeholder's influence stems from both technical and institutional environments (Meyer and Rowan 1991). Both influences are likely either to hinder or to shove an organization's performance. The literature provide elements for accepting stakeholder influences as an important issue for the understanding of an organization performance (Oliver 1991). For shaping the framework, we conclude this section proposing that public organizations performance is a set of performance measures aiming to assess efficiency, economy, effectiveness, and equity. We also propose that the best performance measures are those related to stakeholder expectations and interests. For example: local population expect best value for the money they for taxes; they also expect public organizations do more with less; public services need to make a difference in their lives improving them to live a better life; finally, they expect that the whole society are entitled to receive good quality public services.

Finally, it is worthy to mention the role of the Balanced Scorecard (Kaplan and Norton 1996) on the devising of performance measures. In the first time, the model was devised for helping for-profit organizations to create a balanced set of performance indicators for strengthening strategies and performance. The idea was very interesting and appealing due to the facility of its operationalization. In the beginning of the 2000s, several authors started to use it for non-for-profit and public organizations with a relative success (Kaplan and Norton 2001). It is fact that non-for-profit and public organizations do not pursue profit in the sense private organizations do. However, the other dimensions of performance, namely, internal processes, innovation and learning, and finance, are very likely to be used as feasible and reasonable dimensions of performance. In the next section, we present some studies involving performance measurement in Brazil.

## Some Empirical Evidence of Performance Management in Brazil

Even though its embryonic stage, some efforts have been made as making more sense on performance management and measurement in Brazilian Agencies. Fabrino et al. (2014) have assessed levels of educational performance in terms of the amount of money spent by Federal Government. According to them, more money not necessarily leads to higher levels of performance in terms of learning and skills. They argued the need for improving social and economic conditions as well. In the same vein, Valle and Gomes (2014) assessed money availability as a means for ensuring educational effectiveness. In their viewpoint, managing is more important rather than making money available for elementary education.

Other authors have focused on managing financial resources. Avellaneda and Gomes (2015) found empirical evidence that managing resources is dependent upon population size

where very small and very large populations are not positive to good performance in terms of managing financial resources. This is in line with finds from a research carried out with Colombian municipalities (Avellaneda 2009). In the same line of thinking, Gomes et al. (2013) identified positive relationship between population size and municipal capacity for raising money and for reducing expenditures.

Examples of performance approaches using the Balanced Scorecard or other models, such as performance prism (Neely et al. 2002), SMART performance pyramid (Cross and Lynch 1989), the Business Excellence Card (Kanji 1998), among others which are dealt with in this piece. No doubt, BSC is the most popular among them being used by every type of organization. Ricardo C. Gomes and Liddle (2009) have used the BSC for proposing perform indicators for a non-for-profit organization attached to a public university in Minas Gerais (Brazil). Kaufmann and Becker (2006, p. 39) studied the challenges of putting BSC to practice in Brazil. According to them, the BSC is more fit to developed countries in which the environment is "relatively stable." Despite that, there are several references at the World Wide Web about Brazilian public organizations using BSC or other kinds of performance models. For example, Evangelista de Barros and Wanderley (2016) presented BSC as a strategic tool for oil companies. Souza and Cordeiro (2010) analyzed waste management using BSC. Although they have not been systematically studied in Brazil, these models are acknowledged as good managerial tools for both public and private organizations.

## Conclusions

This piece aimed to present the whereabouts of performance management and measurement in Brazil. In times of crisis, scholars search for tools and mechanisms for improving the best they could the use of the scarce resources. And this is exactly what is happening down here in Brazil. Inflation is high (pretty much controlled right now), unemployment is very high, and corruption is eroding the social and economic tissue. Trying to fight these problems, public and private organizations engage in employing business-based tools for making the managerial process more "scientific' and salable to society.

For this end, we presented how we see performance management in terms of theories and mechanisms. Performance indicators are devised upon dimensions of efficiency, economy, effectiveness, and equity. As mentioned before, in Brazil, we also used a fifth measuring of efficacy, which means assessing target accomplishment. If performance indicators are based upon dimensions, they also reflect stakeholders' expectations and interests. The idea is a satisfied stakeholder is very likely to increase the organization's success.

In empirical terms, we presented several experiences in which performance indicators and performance management were dealt with for figuring out means for improving performance. Though explored in the international literature, there is not to date any case of performance indicators in Brazil in which stakeholder's expectations have been put to practice. We have been talking a lot about inclusion, transparency, and participation, but stakeholders are still not dealt with properly when the case is performance.

## Synonyms

Performance assessment; Performance management; Policy evaluation; Program evaluation; Program review; Staff appraisal

P

## Definition

Dessler (2013, p. 284) defines performance measurement as the task of "evaluating an employee's current and/or past performance relative to his or her performance standards." McDavid et al. (2013, p. 490) defines performance measurement as "the process of designing and implementing quantitative and qualitative measures of program results, including outputs and outcomes." Based on these two definitions, performance measurement is applicable to the evaluation of an individual as well as a larger unit such as a program, and there are multiple approaches to do this. In fact, it is applicable to a wide range of tasks, such as education and training, machine testing, and organizational management. In this chapter, only its

application in public administration is examined. Performance measurement, defined in the context of public administration, is the task of assessing the performance of an individual or a group of individuals in the public sector using one or more methods, processes, and criteria.

## Introduction

In this chapter, performance measurement at both the individual and group levels is examined. At the individual level, it manifested as staff appraisal. Since adverse competition among staff is detrimental to organizational cohesiveness and effectiveness, group-level measurement has been increasingly emphasized. The measurement unit in this case can be a service, a program, a policy, or an organizational unit (e.g., branch, department, bureau). At the group level, performance results encompass not only those of the human component but also of components such as rules, regulations, and infrastructure. The human component ultimately is held responsible for the eventual success or failure. For this reason, this chapter focuses on the human component.

## Purpose

The purposes of performance measurement are multi-folded:

- Reward and punishment – To reward and punish is the most common but a limited view of the rationale for performance measurement. The broader reason is to enhance management in many respects. In a meritocratic system, rewards and punishment should rightly be based on actual performance with verifiable evidence. Performance measurement nevertheless is the means for deciding reward and punishment.
- Feedback to management – The study of system theory and cybernetics has advanced the concept of organic organization (i.e., learning organization). It asserts that, in order for an organization to adapt to changes and survive, it has to get feedback regularly to assess its operation and output. Performance measurement provides such feedback.
- Feedback to employees – Performance measurement allows employees to gain feedback from their assessors, often their supervisors, for an understanding of their performances and the supervisors' expectations. Such feedback is needed for their career planning.
- Culture shaping – An organization needs to form consensus among its employees to develop norms, values, and a healthy culture. A strong culture makes an organization cohesive, attracts appropriate new members, and improves efficiency and effectiveness. Performance measurement influences employees' minds and behavior to establish norms, values, and culture.
- Strategic management – The global environment is changing rapidly. Surveying global changes is referred to as political, economic, social, and technological (PEST) scanning. Successful organizations are able to adapt continuously to environmental changes. The adaptation strategy involves identifying threats and opportunities and assessing the organization's strengths and weaknesses (SWOT analysis). Program or policy evaluation facilitates external communication to assess whether an organization's outputs are meeting people's evolving needs. Staff appraisal reveals the strengths and weaknesses of the current staff. Both are necessary for strategic planning (U.S. Office of Personnel Management 2016).

## Individual Assessment (Staff Appraisal)

### Function

Theories of organizational behavior indicate that employees have needs and expectation. They expect that their efforts would lead to performance, performance to reward, and reward to meeting their personal needs. Their needs go beyond money and security, seeking also friendship, a sense of belonging, esteem, achievement, power, personal and

career growth, and self-actualization (i.e., fully realizing their potentials). They believe in equity, except the unscrupulous ones. If an organization is perceived to be meritocratic, its employees would be motivated to work harder and perform better. Staff appraisal serves the function of communicating with employees to establish an understanding of how the *effort-performance-reward-needs attainment* linkage can be realized (Robbins 2005, pp. 175–192, 526).

### Criteria

Staff appraisal criteria should be based on job requirements and verifiable. Since different jobs could entail vastly different requirements (e.g., firefighter vs. accounting clerk), it is difficult to formulate universal criteria. However, standardization reduces cost and gives the appearance of fairness. Hence, public organizations tend to prefer universal criteria. This leads to criteria being too general and even irrelevant. For example, the central government of China uses the following universal criteria: virtue, ability, diligence, work result, and integrity. Criteria such as virtue and integrity are hard to measure and may be irrelevant to certain jobs (e.g., janitor).

A modified approach is to provide optional criteria in addition to universal ones. Optional criteria can vary from unit to unit, from job to job, to suit specific requirements. Guidelines should be set up to prevent optional criteria from being misused (e.g., for unfair promotion).

Another approach is to set up different sets of criteria for different types of job. For example, the US government identifies three types of design (behavioral based, objective based, and result based) and advocates using a different design for a different type of jobs (U.S. Office of Personnel Management 2016).

The Singapore government, well known for its business-like management, adopted a model from Shell Oil Company in the late 1990s, which assesses both potentials and work results with an aim to identify talents for development and promotion (Vallence 1999).

SMART (Doran 1981) is a set of general guidelines for formulating assessment criteria. Its five letters stand for being (S)pecific in expectation, strategy, process, and time limit; (M)easureable in quantity, quality, cost, and time used; (A)ttainable within the employee's efforts and the organization's resources; (R)elevant to the employee's job and role in the organization; and (T)rackable within a time frame. In addition to SMART, assessment criteria should be linked to career development (e.g., self-enhancement, voluntary training), unsusceptible to manipulation by any person, comprehensive to cover all aspects of the assessee's responsibility, and usable for personnel decisions and human resources planning (Carter 1991).

### Method

Regular employees usually have their performances appraised annually by their supervisors. Contractual or appointed personnel can have their appraisals done prior to the expiry of their employment periods. Traditionally, the appraisal was made unilaterally by the assessor without much communication with the assessee. This simplistic approach does not serve the full range of functions required in today's management. Performance contract (or agreement), similar to management by objective (Odiorne 1965), emerged as a popular approach in civil service reforms (e.g., UK, Australia). This approach begins with a consultation meeting between the assessor and the assessee, in which both discuss, or negotiate, future expectations and set the performance targets (i.e., goals and objectives) for the assessee.

Employees may have aspirations beyond their current competence to achieve. Increasing staff competence leads to higher productivity and better work. In the consultation meeting, employees are encouraged to aim higher with the employer providing the assistance needed for improving competence. Options for knowledge and skills enhancement (e.g., retraining, apprenticeship) are explored with a focus on feasibility. Competence assessment is particularly important for the appraisal of managerial and executive personnel, as people were often promoted to a level beyond their competence to master (i.e., Peter Principle; Peter and Hull 1969). Identifying competence

gaps prevents misjudgment and helps employees to upgrade their capability.

A midterm meeting is usually held to review progress and reset targets if there are reasonable reasons to do so (e.g., unforeseen problems, crisis). To conclude the process, a final meeting takes place at the end of the evaluation period to examine the extent to which the targets have been met, the problems or difficulties encountered, and other relevant information to finalize the assessment. The Hong Kong government adopted the above concept and has a performance management cycle consisting of four phases: (1) performance planning, (2) continuous coaching and development, (3) midyear review, and (4) performance appraisal (Hong Kong Government 2016).

A number of elements can be added to this approach to enhance its effectiveness. Some government added self-assessment to identify assessor-assessee judgment gaps. Some allow subordinates to evaluate their supervisors' performances to make the process equitable. These approaches may have the potential of enhancing management-staff communication, but whether subordinates dare to speak truthfully is doubtful.

### Evidence

Selective perception and shortcuts are often used in making human judgment, and this leads to bias, mistakes, and unfairness (Robbins 2005, pp. 136–143). Staff appraisal should therefore be based on objective evidence as much as possible. On the surface, frontline workers can have their performances measured by the quantity of work done. However, the amount of work done by an employee may not have any relationship to the employee's performance or effort, since it is dictated by public demand, the number of workers doing the same job, and the amount of work allocated by the supervisor. Quality of work, more appropriate in this regard, is difficult to measure. Consequently, staff appraisal is based on the subjective judgment of the supervisor.

Managerial and professional jobs, which require knowledge, skills, and analytical and decision-making skills, are very difficult to have performance measured. A popular approach is the critical instances method (Flanagan 1954) which requires the assessee, the assessor, or both, to identify critical instances (e.g., crisis, politically sensitive cases) that exemplify the assessee's achievement or mistakes. These critical instances are then analyzed to assess the employee's performance. Another approach is to use multiple assessors to avoid consistent bias. For example, 360° assessment requires the assessee to be evaluated by everyone working around him/her including the superior, subordinates, peers, and if applicable working affiliates in other organizations. If the size of a particular category of assessors is too large (e.g., subordinates), a sample would be selected. In normal practice, the assessee can name a few enemies for exclusion to prevent the process from being misused for personal vendetta. This approach, costly and time consuming, is usually used on highly ranked personnel (e.g., bureau directors, department heads).

Performance measurement involves some form of estimation. Depending on the criterion, the estimation may be made with reference to one's previous performance, an overall average, a benchmark, or a set target. Although written description conveys richer information, it is time consuming and harder to use. Therefore, numeric and ranking scales are used in a variety of techniques for scoring performance results (e.g., Dessler 2013, pp. 190–199), with comments attached if necessary.

Highly ranked officials (e.g., deputy ministers, bureau directors) are held responsible for not only their own actions but also the actions of all under their charge. For this reason, client satisfaction survey, which shows general public opinions of a service, has been increasingly used to measure executive performance.

The final appraisal result may appear in many forms, such as a numeric rating (e.g., five-point scale) with or without a label (e.g., excellent, good, average, poor, very poor), a numeric percentile (e.g., top 20%), or a written document. Very often, more than one form is used (e.g., numeric rating plus written comments). A method less often used is to rank staff from best to worst (e.g., Singapore). Aside from being

time consuming, this method may emphasize individual competition too much to create adverse competition.

### Consequence

Distinguished performance should lead to rewards (e.g., monetary prize, paid vacation, public praise). Recognizing that different employees may have different priorities of needs, it is advisable to offer more than one type of rewards for employees to choose (e.g., extra pay or paid vacation). Consistently good performance should lead to promotion. Canada's Accelerated Executive Development Program is designed to identify potential leaders and reward exemplary employees (Treasury Board of Canada Secretariat 2016).

Satisfactory, or average, performance should allow the employees to keep their current positions. In Hong Kong, civil servants need at least a satisfactory rating to get pay-scale increment. Unsatisfactory performance should not result in immediate punishment, as the assessee may have mitigating reasons (e.g., sudden crisis, insufficient resources). Remedial efforts such as retaining, job reassignment, and management review should be considered. Only consistently poor performance should lead to demotion or dismissal. In Hong Kong, civil servants with a poor performance rating are given at least 6 months to improve their performance to avoid disciplinary action (Hong Kong Legislative Council 2003).

Appeal and grievance procedures should be institutionalized to ensure fairness and to prevent abuse of power. Complaints from assessees should be handled by an independent authority to ensure fairness. In Canada, the Public Service Labour Relations and Employment Board, consisting of former executives and legal experts, is responsible for handling employee complaints.

### Case Presentation: Macao Government

The Macao government (special administrative region of China) revamped its performance appraisal system for regular staff in 2005. The equivalent policy for executive performance assessment had not yet been finalized as of March 2016.

Function – According to Law 8/2004, the functions of staff appraisal are (1) to motivate employees, (2) to improve staff performance, (3) to foster superior-subordinate communication, (4) to improve human resources management, and (5) to promote service excellence.

Criteria – According to Administrative Regulation 31/2004 and Law 8/2004, staff appraisal encompasses seven compulsory and eight optional criteria. The compulsory criteria consist of work results, sense of duty, continuous improvement, adaptability and flexibility, interpersonal relationship, diligence, and time management. Among them, work result and sense of duty are considered more important and counted double (i.e., equal to two criteria). The optional criteria include independence and self-management, innovation and creativity, resources management, team work, public relations, team leadership and management, negotiation and decision-making, and sense of mission. The general principles for choosing optional criteria are justice, equality, impartiality, and relevancy. In terms of relevancy, the optional criteria are more suitable for professional or managerial staff.

Method – Staff appraisal is conducted annually and consists of six steps: (1) appointing assessor, (2) assessors' meeting, (3) assessor-assessee meetings, (4) self-assessment, (5) finalization, and (6) approval. In step 1, the immediate supervisor is usually the appointed assessor, but another supervisor can also be selected for a justifiable reason. In step 2, all assessors of the same unit meet with their leader and members of an assessment consultation committee to ensure that everyone is clear about the assessment criteria and procedures. The assessor-assessee meetings (step 3) consist of three parts. The first meeting is held in the beginning of each year for the assessor and assessee to discuss and determine the performance objectives, activities, responsibility, performance targets, and expected results of the assessee for the coming year. A midterm meeting is held to examine the assessee's progress, to clarify task objectives and priorities, and to modify performance targets and expectation if necessary. A final meeting is held at the end of the year to decide the final

scores. The assessee's performance on each criterion is scored using a five-point scale with the following labels: excellent, very satisfactory, satisfactory, somewhat dissatisfactory, and dissatisfactory. A weighted average score is calculated (work result and sense of duty have double weight) to indicate the overall performance. In step 4, an option for self-assessment is offered. In finalization, the score on each criterion and the weighted average score are entered into the assessment form. Self-assessment scores are considered by the assessor but do not enter into the scoring process. The assessee can also fill out an optional supervisor-assessment form to evaluate the supervisor's performance. The assessment results should be considered by the supervisor but do not include in the supervisor's official performance appraisal. In the last step, the assessee can agree to the assessment result, request explanation, or dispute the result officially.

Evidence – Although the assessment should be based on objective evidence, it is still based largely on the assessee's subjective judgment. Many criteria, such as sense of duty, adaptability, and flexibility, are hard to find objective evidence.

Consequence – According to Law 14/2009, an employee seeking promotion is required to achieve a weighted average rating of not lower than "satisfactory" during the relevant working period. Different working periods are required for employees in different ranks and different levels for promotion consideration. An employee achieving the "very satisfactory" or a higher rating will have the working period required for promotion shortened by 1 year. In accordance to Administrative Regulation 11/2007, recipients of the "excellent" rating receive an award that, by the employee's choice, is either an extra half a month of pay or 10 extra days of paid vacation. In reality, employees will be asked to accept payment if their units are understaffed. A "somewhat dissatisfactory" rating can result in retraining if the employee is to stay in the same job or reassignment of duty or redeployment to another unit if the employee is deemed unsuitable for the job. A "dissatisfactory" rating necessitates disciplinary procedures starting with the supervisor investigating into the reason(s) for the employee's poor performance. Currently, there is no provision for dismissal of regular employees due to poor performance. According to chapter "Organizational Efficiency" of the Macao government's consolidated publication on public employee laws and regulations, contractual employees receiving a "somewhat dissatisfactory" rating will their contracts terminated upon expiry and temporary employees receiving the same rating can be dismissed immediately. Both contractual and temporary employees can be dismissed immediately upon receiving a "dissatisfactory" rating.

Assessees are allowed to dispute appraisal results. Disputes between assessors and assessees are handled by an assessment consultation committee consisting of equal number of members representing the organization and the general staff.

## Group Assessment (Program, Policy, Departmental Evaluation, etc.)

### Function

In addition to individual performance, an organization should be concerned with how its system works as a whole. A people-based system consists of people as well as many other components (e.g., rules, regulations, infrastructure), but only the people would take the praise or the blame for its performance. An open system operates in a changing environment and consists of goals and objectives, input, throughput (i.e., process), output, and feedback mechanisms (Jenkins and Youle 1968). Assessing performance at the system, or group, level allows an organization to gain internal and external feedback vital for strategic planning. It also provides important information for assessing executive performance in managing the system.

### Criteria

The general principles and guidelines for setting up assessment criteria at the group level are the same as those mentioned in explaining staff appraisal (e.g., SMART).

Public services are expected to adhere to the principles of 4E (effectiveness, efficiency, economy, and equity). Assessment criteria can be formulated around these four principles (e.g., Beijing). Equity means that everyone in need of a service is treated the same without exclusion or discrimination. Economy means that the cheapest alternative that delivers the same level and quality of service is chosen over the others and there is very little resources wastage in implementation. Efficiency is a ratio of output to input (i.e., getting the most with the least). In result-based management, output is considered the most appropriate performance criteria. However, the amount of output in a public service is often not in the control of the service provider. For example, an epidemic would increase hospital patients drastically, but this does not mean that hospitals have performed better than before. Furthermore, some public services have a preventive component (e.g., police, fire fighting, health), and the success of which would reduce service statistics (e.g., disease prevention leads to fewer patients to treat). Since prevention is better than treatment, declining service statistics for this reason means better performance, but the efficiency ratio would suggest otherwise. Being efficient does not mean that goals and objectives are better achieved.

Effectiveness refers to the extent of goals and objectives being achieved. Outcome (i.e., result of output) is an appropriate indicator of effectiveness, but it is difficult to measure. The outcome of public services could be highly abstract, hence subjected to individual value judgment (e.g., what is the value of a safer society created by increasing police work?). Democratically, the collective judgment of clients (e.g., client satisfaction survey) is more representative to use for assessing outcome. Clients however may not always be the appropriate judges of outcome. Criminals may not appreciate court services, no matter how good they are. It may also be difficult to define who the clients are in some government services. Are the clients of a prison the prisoners or the law-abiding citizens living outside it (i.e., to keep them safe from criminals)?

It would be futile to maximize all four Es because these principles are in conflict with each other. The most effective alternative is usually expensive and time consuming. Equitable services are usually costly (e.g., postal service for people in remote, small villages). Hence, the four Es should be balanced, rather than maximized, to bring about the best overall policy outcome (Norman-Major 2011).

Since output may not be appropriate and outcome hard to measure, criteria based on input, throughput, and feedback are often used, assuming that high-quality input, process, and feedback lead to better results. For example, a university would be considered having been improved if it has invested heavily in infrastructure and state-of-the-art technology and recruits world-famous scholars. For the same reason, spending on staff training and e-government technology is often used to indicate improvement. In terms of throughput, attention has been shifted from production to management. Criteria based on improving communication with staff, leadership quality, operation procedures, and so on are commonly used. Organizations performing well in management often seek ISO9000 (quality management) and ISO9001 (quality management systems) certification. As governments have the responsibility to protect the nature environment, public organizations also seek ISO14000 (environmental management) certification. International Organization for Standardization (ISO) offers an extensive list of requirements for quality management, with which other organizations consult to formulate their own assessment criteria. In terms of feedback, the criteria are based on both internal and external sources. For internal sources, the quality and adequacy of staff appraisal system, methods of collecting complaints and suggestions from staff, and operation monitoring mechanisms (e.g., absenteeism, turnover) are used to assess the quality of internal feedback. For external feedback, public complaint handling procedures, public relations policy, and the method for data collection, analysis, and reporting of client satisfaction survey are commonly used for assessment.

Measuring the performance of all components of a whole system comprehensively is very similar to Total Quality Management (Lorente et al. 1998). Due to increasing emphasis on strategic

management, whether an organization has clear vision, mission, and values is increasingly used to assess management quality. Various aspects of management such as leadership, planning, policy making, and operation control are examined to assess whether they reach a high level of standard (e.g., ISO standard). Policies on continuous improvement, such as on long-term development strategies, staff training, complaint handling, and client feedback, are particularly emphasized. Input factors, such as staff recruitment and procurement policies, can also be assessed to determine the adequacy of input quality control.

### Method

Due to the heavy workload required, group-level assessment is not conducted annually. The assessment can be done in-house, but the general practice is to use an external authority or outside experts to give the assessment results more credibility. Some organizations conduct an internal review (third year) and an external assessment (fifth year) once every 5 years.

There is a largely number of methods for measuring performance at the group level, depending on the assessment needs (McDavid et al. 2013). As a result of civil service reforms, especially Britain's Citizen's Charter, performance results are often compared with a set of promises known as performance pledges (e.g., UK, Hong Kong, Macao). Similar to staff appraisal, some governments use a three-meeting approach including (1) pledge negotiation, (2) midterm review, and (3) final assessment (e.g., Hong Kong).

For matters of higher significance (e.g., deciding award winners), direct observation (e.g., on-site visit) can be used to assess whether policies have actually materialized in action (e.g., policies on client reception, anti-discrimination, etc.). Client satisfaction survey, focus group (i.e., group discussion involving a small but representative sample of clients), or both can be used for effectiveness assessment. The case study approach can be used to examine critical incidents for assessing leadership performance in decision-making, communication, and crisis management.

### Evidence

Verbal assurance is usually not acceptable as evidence, as people may lie. Written documents, such as policy paper, procedural manual, logbook, records, memorandum, and correspondence (e-mail, letter), are the acceptable forms of evidence. Direct observation, case study, focus group discussion, and client satisfaction survey results should all be documented in writing to allow auditing. Audio and video evidence can also be used for as long as they can be authenticated.

Due to the scope and significance of this level of assessment, the final results are usually presented in a comprehensive report detailing the observations, considerations, and judgment on every criterion, usually with suggestions for improvement.

### Consequences

Teams or units that have achieved distinguished performance are publicly praised and receive an award of excellence, with complementary rewards for the staff involved (e.g., paid vacation, monetary prizes) and/or future budget increases for the unit (i.e., performance budgeting). The assessment is aimed at recognizing good performance rather than justifying punishment. Nevertheless, units having dissatisfactory performance may face a budget cut or be denied a budget increase. The head of the unit may face difficulties in getting promotion or even demotion if poor results persist, as the assessment results are generally incorporated into executive performance evaluation.

Government departments are more inclined to accept assessment results than individual employees, because refusal to accept criticism invites public ridicule. Some governments have an independent committee to handle appeals. Without such a venue, the appeal will have to go back to the assessment authority or the highest level of administration (e.g., president), since the assessment authority is usually an independent body (e.g., audit commission) answering only to the chief executive.

### Case Presentation: Macao Government

Function – According to the requirements document and operation guidelines provided by Macao's Public Administration and Civil Service Bureau, the Macao government assesses performance at the service level with the following aims: (1) clarifying vision, mission, and values; (2) improving operational procedures; (3) normalizing and standardizing operational procedures; (4) increasing transparency to the public; (5) establishing internal quality assurance mechanisms; (6) promoting a people-oriented service culture; and (7) establishing a culture of continuous improvement and building related mechanisms.

Criteria – The aforementioned documents stipulate that all services with external (i.e., public) clients must offer performance pledges. Currently, the validity and adequacy of performance pledges and the methods of managing performance are the main focus of assessment. The content of performance pledges will be assessed in the future after sufficient improvement has been made. For a satisfactory rating, the minimum requirements are (1) clear goals and objectives and all employees participated in making improvement, (2) unambiguous service quality indicators, (3) adequate transparency, (4) thorough corporation with operational partners in other agencies, (5) adequate prevention and correction mechanisms, and (6) acceptable level of public satisfaction. Award winners must demonstrate, in addition to the above requirements, excellence in leadership, strategic planning, human resources management, client communication, and process management, meet performance pledges, and show continuous improvement.

Method – The assessment is conducted by Macao's Civil Service Performance Assessment Commission, which is formed by the chief executive, chaired by the director of the Public Administration and Civil Service Bureau, and consists of three academics from three different institutions and a productivity expert to ensure objectivity and impartiality. The assessment is conducted once every 2 years. Assessment criteria are reassessed and modified regularly to raise the level of requirements to ensure continuous improvement. Assessment results, consisting of two categories (pass and fail), are explained in a detailed report provided to the service unit with improvement suggestions offered.

Evidence – The assessment is based mainly on official documents supplied by the service unit. Award applicants have to supply more documents to verify their performance on the competition's additional requirements. Those applicants meeting the requirements proceed to the second phase of the competition, in which they are required to have their operations observed by members of the assessment commission and defend their performance in a meeting with the same members.

Consequences – The assessment results are made public in a press briefing and put on the government's website. Public embarrassment is only form of punishment for those failing the assessment. In accordance to the Macao government's participant guidelines for the Second Civil Service Excellence Awards, exemplary performers are eligible to compete for awards in five categories: exemplary department, outstanding team, excellent service, excellent frontline service, and effective application of communication technology. A service unit can compete for more than one award. Award winners are publicly praised in the media and in an award ceremony. A certificate and a trophy are presented to each winning team and a lapel pin for honoring the achievement is presented to each team member. Appeals, concerning performance assessment or award results, can be made to the assessment commission or the chief executive.

## Conclusion

Performance measurement serves numerous important management functions including deciding reward and punishment; providing feedback to management and staff; shaping values, norms and culture; and providing vital information for strategic management. There are two level of measurement: individual and group. The

appropriate assessment criteria should be based on job requirements and vary from job to job and from unit to unit. Current trend shifted the focus of assessment from individual to group and from output to management, with an emphasis on continuous improvement and improving every parts of an organization. The assessment method shifted from internal appraisal to external review and client-based survey.

# Performance of Nonprofit Services

Michele Tantardini
School of Public Affairs, The Pennsylvania State University – Harrisburg, Middletown, PA, USA

## Synonyms

Accountability; Effectiveness; Efficiency; Indicators; Input; Outcome; Output; Performance information use; Performance management; Performance measurement; Quality; Quantity; Stakeholders

## Definition

Performance measurement is the systematic definition of performance indicators and their measurement along various dimensions of performance (e.g., output, outcome, quality, efficiency, and effectiveness), in order to create empirical evidence of how nonprofit organizations operate and achieve their operational and strategic goals.

Performance management is the systematic use of performance information by managers in order to make decisions that affect the management of the organization itself and the delivery of services to customers, business, and government. The use of performance information can help nonprofit organizations in making a greater impact because decisions hence made are based on real knowledge and empirical data.

## Introduction

The praxis of measuring and managing performance has become prevalent in all types of organizations: private, public, and nonprofit. The definition and collection of performance data, which constitute the basis of performance measurement, and the successive use of such information in every managerial decision-making process, which constitutes performance management, are of fundamental importance in order to set goals and objectives to achieve an organization's mission and vision; allocate resources; manage people, organizations, and programs; and evaluate.

Although the nonprofit sector has assumed a very important role in many aspects of the economic, political, and social life of both developed and developing countries (Hoque and Parker 2014), there are still some debates as to how managerial practices should be adapted to account for the unique characteristics of this sector. Given such relevance, a definition of what constitutes the nonprofit sector is essential in order to be able to properly address the measurement of the performance of such organizations. The terms such as "nonprofit sector," "charitable sector," "independent sector," "voluntary sector," "tax-exempt sector," "nongovernmental organizations (NGOs)," and "third sector" have been used to identify these organizations that have similar set of characteristics distinct from the private and public sectors. For instance, membership and service in this sector rely extensively on volunteers, and, unlike the for-profit organizations, these organizations do not distribute profits among members-owners.

Measuring and managing the performance of nonprofit organizations can be more difficult in comparison with these tasks in private sector organizations because of the unique features of the nonprofit sector. This contribution aims to shed a better understanding of how, and by what means, performance can be measured and managed in the nonprofit sector. This entry begins by analyzing the differences between the nonprofit and the private sectors in terms of performance measurement and accountability. The discussion continues to present specific guidelines for adopting and implementing performance measurement systems for the nonprofit sector. Next, general guidelines are presented for how to assess the performance of nonprofit services along with a discussion of performance indicators. The entry concludes by discussing the use of performance information to inform managerial decision-making and in the day-to-day management of such organizations.

## Nonprofit Performance Measurement

Measuring the performance of nonprofit services can be a difficult task because of the distinctiveness of this sector in comparison to features of the for-profit sector. The differences with respect to both measurement and accountability differentiate between the design of performance measurement systems in the private and nonprofit sectors. One common argument is that private sector performance measures are easier to quantify. There are several common for-profit performance measures – many of which are financial indicators – such as profit, Earnings Before Interest, Tax, Depreciation, and Amortization (EBITDA), Return On Investments (ROI), market share, and customer satisfaction. However, measuring performance in the nonprofit sector, as in the public sector, is more difficult because of the challenges in finding quantifiable indicators that can measure social change in terms of the impact that nonprofit organizations create.

Nonprofit organizations are directly accountable to a larger and more diverse group of stakeholders than commercial entities. Therefore, performance measurement is a more straightforward task for for-profit corporations to undertake. Performance indicators in the commercial sector are well established and either private owners or public shareholders are the main end-users of these indicators. Performance indicators in the nonprofit sector appear to be more problematic due to challenges relating to measuring impact, the multiplicity of stakeholders to whom this information is relevant, and linking performance measures directly to mission statements, mission-related goals, and desired outcomes.

Although much of the focus with respect to measurement is on the performance of services provided by nonprofit organizations, there are other aspects of organizational performance to consider including an organization's long-term economic and financial sustainability. These are fundamental aspects of organizational performance for an organization's sustainability and ability to attain strategic goals. Therefore, when measuring the performance of nonprofit organizations, specific accountability demands, mission-related goals, and intended social impact should be taken into consideration. There are several general guiding principles for the design of performance measurement systems (Harris 1998; Micheli and Kennerley 2005):

- No performance measurement system can fit all types of nonprofit organizations. Performance measurement systems need to be tailored for the specific nonprofit organization, its services, and the environment in which it operates.
- Performance measurement systems cannot be omni-comprehensive. These systems can only capture a few relevant aspects and dimensions of the overall performance of an organization. Measuring and managing the performance of an organization is a very time- and resource-consuming task which must be prioritized toward only those things that really matter for the organization.
- Nonprofits should not view efficiency and effectiveness as the ultimate end goal of adopting and implementing a performance measurement and management system. Rather, nonprofit organizations should see the achievement of efficiency and effectiveness as a way to enhance and sustain their mission.
- Performance measurement systems can be used to modify organizational behaviors. However, they can also be modified by organizational behaviors. Particular attention is needed in both the adoption and implementation of a performance measurement system in order to ensure that the entire organization accepts and embraces the new performance-oriented culture. This is a participatory trait of performance measurement and management that should be accounted for in the implementation phase.

There are several managerial tools aimed at comprehensive nonprofit performance measurement. Among the many options, more and more nonprofit organizations have adopted balanced scorecards (BSC) to measure their performance, which is a method that originated in the for-profit sector. The basic model of the balanced scorecard is composed of measurements that summarize four different dimensions of nonprofit performance from a financial perspective, customer (beneficiary) perspective, internal perspective, and learning and growth perspective. To effectively utilize this for-profit sector measurement tool, nonprofit managers must carefully adapt the BSC method to their own organization's mission and also address the differences that exist between the private for-profit and the nonprofit sectors. For example, the financial perspective should be replaced by the *fiduciary perspective*, which captures the contributions of donors and taxpayers (Kong 2010).

One of the advantages of the balance scorecard is that it can help nonprofit organizations link their mission, vision, and strategy to day-to-day operational activities. More importantly, the adoption and implementation of a balance scorecard can help organizations to move from output-based performance measurement to outcome-based performance measurement. This shifts the emphasis of measurement from what the nonprofit organization delivers to the outcomes – or impact – its services produce for beneficiaries, other nonprofit organizations, and/or the community at large. This shift underscores important differences between measuring nonprofit outputs and outcomes, which will be discussed more in the following section. A useful feature of the balance scorecard approach is that it allows nonprofits to capture measures with respect to strategic goals, service delivery, and long-term financial sustainability with one managerial tool. Thus, in terms of the guiding principles outlined in the previous section, the balance scorecard appears to resolve some of the issues that nonprofit organizations face in measuring performance. And, it is a tool that is adaptable

to the unique characteristics of different types of nonprofit organizations.

This section discussed features and characteristics of performance measurement systems for nonprofit organizations, and it presented the balance scorecard as an example of a performance measurement tool. The following section will discuss performance indicators to measure the performance of a nonprofit service in conjunction with the logic model, also referred as Input–Output–Outcome (I-O-O) model, which links various aspects of performance. Several examples of performance indicators for specific nonprofit sector services are presented as illustrations.

## Dimensions of Performance Measurement

In this section, the logic model is introduced and discussed placing particular attention to the distinction between inputs, outputs, and outcomes. The main purpose of the logic model is to link resources, processes, outputs, and outcomes. The second main purpose is to constitute a basis for performance measurement. The logic model is useful for establishing the basis for performance measurement and distinguishing between different types of performance measures, such as efficiency, effectiveness, and quality of nonprofit services. The differences and relationship between these performance measures are illustrated by providing examples of specific performance indicators for a nonprofit organization that feeds and shelters homeless people.

In measuring the performance of a nonprofit service, the following dimensions of performance should be taken into consideration: the quality of services provided, the level of efficiency in delivering these services, and the effectiveness of the organization in creating a short- and long-term impact with respect to its mission and mission-related goals. These dimensions of performance are illustrated using a logic model to establish the context for performance measurement. Figure 1 illustrates how the logic model is structured. The logic model links inputs (resources), processes, outputs, and outcomes in relation to mission-specific purpose and goals. The logic model is critical in order to identify the relevant variables of an organization and the relationships among these variables. In addition, the logic model helps nonprofit organizations to clarify expected outcomes and how to achieve them. Consequently, this process also helps to identify appropriate performance indicators based on relevant variables and the relationships among them.

Inputs are all the tangible and intangible resources that an organization uses in order to produce its goods and to deliver its services. Examples of tangible resources are personnel, office spaces, equipment, and machinery, while examples of intangible resources are patents, software, and social capital. In the case of a nonprofit organization that feeds and shelters homeless people, inputs include volunteers, groceries, and donations. These inputs are processed in order to produce outputs. Outputs are the product of the transformation of inputs and can consist of both goods and services. In other words, outputs are tangible; they are the direct result of NP programs. Using the example of a nonprofit organization that feeds and shelters the homeless, outputs are the number of meals served, people fed, and beds provided. Nonprofit outputs are related to, but not the same as, outcomes. Outcomes refer to the social change that occurs, or the impact made, as a direct result of a nonprofit organization's programs measured according to short-, medium-, and long-term indicators of success. The key distinction between outcomes and outputs is that outcomes are directly linked to a nonprofit's mission – the change it aims to make in the world. Thus, measuring a nonprofit's success with respect to its mission-related goals requires identifying

**Performance of Nonprofit Services, Fig. 1** The Logic Model

both reliable and measurable indicators of social change. If, in the previous illustration, the mission of the nonprofits is to provide homeless people with shelter, food, and clothing and equip each person with tools to re-entry in the society, then an example of a short-term outcome could be the reduction of malnutrition among the homeless population. A medium-term outcome could be the enrollment of homeless people into training or vocational schools with the aim of providing them skills to enter the workforce. And, an example of a long-term outcome would be homeless people that currently have a job as a result of the training received.

Once the relevant inputs, outputs, and outcomes of a nonprofit have been established, the three performance measures – quality, efficiency, and effectiveness – can be interpreted in relation to the logic model. The quality or level of the service provided, generally, refers to the output component of the logic model. Efficiency is the ratio between input and output measures. The opposite ratio, output over input, is also defined as productivity which can be used as a fourth complementary dimension of performance. Effectiveness is the ratio between outputs and outcomes. Cost-effectiveness compares inputs to outcomes. However, this dimension of performance is used infrequently and is not very helpful for assessing NP performance.

Performance indicators or metrics refer to how a measure is operationalized, which means how it is specified and observed, and what unit of measurement is used. The case of the nonprofit organization that feeds and shelters homeless people will continue to be used as a useful illustration to demonstrate how these measures can be applied in practice. The quality of services provided can be assessed by using two indicators. The first one is the average time of acceptance of a homeless person in the shelter. Average time is a classic indicator that measures the quality of a service: the lower the average time, the better is the service provided. A second indicator that could be used is the ratio between the number of volunteers of the shelter home and the number of homeless people sheltered. Measuring how many service providers are available for each person served is another indicator of the quality of the service.

The average cost of providing a meal and the average cost of providing night assistance to the homeless are two examples of indicators used to measure the efficiency of a service. Average cost is a classic indicator of efficiency. The lower the indicator, the better the performance as long as the quality of the service remains constant. In terms of effectiveness, customer satisfaction is typically used to measure how effective an organization is in delivering its services. Another indicator would be the ratio between the number of homeless people that asked to be sheltered in relation to the number of homeless people that have been sheltered. How well an organization is able to satisfy the demand for a particular service is a common indicator of an organization's effectiveness.

## The Use of Performance Information for Decision-Making

After measuring these four dimensions of performance and tracking these indicators, performance information is usually incorporated into documents and made available to managers for its use. Performance information is used by managers in order to inform their decision-making process. Adopting and implementing a performance measurement system requires a lot of effort in terms of time and resources used by an organization that would be wasted if performance information is not interpreted and applied properly by managers and other stakeholders in their decision-making process. Therefore, it is vital that valid and reliable performance information is provided to, and used by, managers in order not to waste the resources invested by the organization in adopting a performance measurement system. By using performance information, managers are able to understand how well an organization is able to deliver a service and how efficient and effective the organization is. By being aware of the performance of their organizations, managers can design action plans to improve the quality, efficiency, and effectiveness of their organizations, and thus become more successful in their operations. Given the specificity of the nonprofit sector and the scarcity of resources, an informed and

evidence-based decision-making process is vital to the survival of these organizations.

Much of the research on performance information use focuses on understanding what organizational and individual factors lead managers to use performance information in their decision-making process. Individual-level factors such as managers' motivation, leadership, and individual beliefs and organizational-level factors such as organizational culture and stakeholder involvement have been identified as drivers of performance information use. Among these organizational factors, managers in organizations richer in organizational social capital are more likely to use performance information (Tantardini and Kroll 2015). Although organizational social capital and performance information use have been studied primarily in the public sector, the results can be extended also to the nonprofit sector given the peculiarities of this sector. Organizational social capital is an intangible resource that members of an organization help to create and in turn can benefit from. Social capital is composed of three dimensions: structural, relational, and cognitive (Nahapiet and Ghoshal 1998). The structural dimension refers to the number of connections that managers and employees have within their organization. The relational dimension refers to the level of trust among managers and employees of an organization. The cognitive dimension refers to an organization that has a shared goal and enacts this goal in a collective way.

Organizational social capital seems to foster the use of performance information in the managerial decision-making process: the more managers and employees are connected to each other within an organization, the more likely they are to exchange performance information. The more performance information is available, the more likely managers inform their decision-making process. Furthermore, the more managers trust the performance information source, the more likely they are to use it because it is readily available and they consider it reliable. Finally, if an organization has shared goals and tries to achieve these goals collectively, managers are more likely to use performance in order to understand the level of achievement of the shared goals. Therefore, organizations richer in the organizational social capital are organizations in which managers are more likely to use performance information in their decision-making process. In sum, organizational factors are important considerations in performance management – especially in the design and implementation of performance measurement systems.

## Conclusion

This entry provides a description of measuring and managing the performance of nonprofit services. It started with a definition of what is the nonprofit sector in order to clarify the boundaries within which performance measurement and management occurs. It then highlighted relevant differences between performance measurement and management practice in the public and the private sectors both in terms of accountability and how performance is assessed. The entry described a general framework for evaluating the performance of nonprofit services both from a theoretical and a practical point of view. Measuring the performance of nonprofit services has been discussed by taking into consideration the logic model and three dimensions of performance. For each of these three dimensions, specific examples of performance indicators for a nonprofit organization were given. The entry concludes by examining the use of performance information in managerial decision-making process.

Measuring the performance of nonprofit services is of fundamental importance. It allows organizations to understand their strengths and weaknesses and, through management, to enhance strengths and reduce or improve weaknesses. Performance measurement and management assumes an important role with respect to impact and sustainability. In terms of accountability to stakeholders, and donors in particular, performance management enables a nonprofit to document what it does, monitor how well it performs, and improve the efficiency and effectiveness of its operations. This is extremely important in order to secure ongoing resources and donations. Performance measurement is a tool in service of the mission and goals for which the

organization was created. Measuring the performance of nonprofit organizations will not in itself solve the problems, difficulties, and struggles that organizations face every day. However, it will help guide nonprofit managers in designing strategies and interventions to improve the organization's impact in the community it serves.

# Performance Reforms, Ethical Issues, and the Veterans Administration

Barbara A. Patrick
Department of Political Science, Eastern Michigan University, Ypsilanti, MI, USA

## Synonyms

Accountability; Integrity; Military; Outcomes

## Definitions

Accountability – being held responsible for one's actions and outcomes.

Public integrity – operating in a manner that is ethical, moral, and mindful of the needs of others.

## Introduction

The desire to enhance efficiency and effectiveness in the public arena has increased the emphasis on performance-based policies. Many of the reforms are captured by New Public Management's efforts to rightsizing the workforce, adopting data driven processes, and utilizing performance accountability. Advocates of the movement propose such reform will increase employees' productivity. However, scholars question its impact on ethics (Anechiarico and Smith 2005). In the field of health of administration, these concerns surfaced as allegations that the Veterans Health Administration acted unethically in its quest to reduce cost and wait times for services. Inspector general investigations revealed data manipulation, secret waiting list, and other unethical actions resulted in death and poor health care for veterans across the country.

Given the impact of performance reforms on veterans' health care and other public entities, it is important to examine their implementation and ethical impact. This research examines the Veteran Health Administration's (VHA) use of performance reforms. More specifically, it assesses how efforts to incorporate results-based reforms created a lapse in employees' willingness to act ethically. The discussion begins with an overview of performance reforms and ethics in the public arena. It proceeds with an analysis of the VHA's health scandal and concludes with reform suggestions.

## Performance Reforms

Public organizations have often been characterized as rigid entities that use rules and bureaucratic accountability to ensure employees

follow procedures, treat all citizens the same, and uphold ethical standards. During the 1990s, this model encountered criticism as those seeking to reinvent government argued it promoted complacency, hampered creativity, devalued the significance of enhanced performance, and stifled productivity. They proposed applications of goals theories and business-type practices would enhance outcomes due to their emphasis on performance targets, data driven decision-making, rightsizing, and investments in technological infrastructure. Elected official embraced the reforms but failed to adequately consider their impact on ethics.

For example, goals theories propose the use of clearly defined goals, challenging outcomes, and accountability mechanisms that will increase employee productivity (Locke and Latham 2006).

However, market studies revealed Sears Roebuck and Ford Motor Company's applications of aggressive goal models resulted in Sear's employees overcharging customers, thousands of dollars, and Ford employees rushing the Pinto to the marketplace resulting in the injury and death of customers so that the employees might meet challenging performance goals (Ordonez et al. 2009; Dishneau 1992). Others have posited the promotion of aggressive or unrealistic goals and performance models can result in additional ethical lapses such as data manipulation, trickery, and misinformation (Cohen 2009), the silencing of whistleblowers (Ethic Resource Center 2008), the withholding of information, cheating to gain a financial benefit (Ordonez et al. 2009), and numerous other actions that threaten the integrity of the organization.

In order to limit the impact of these threats in the public arena, researchers have argued that a series of under examined assumptions must be considered and accounted for. They include: (1) the removal of competing goals that increase employee stress, (2) the development of performance targets that value long-term growth and not short-term change, (3) goals must be realist and not so aggressive that they cause employees to feel hopeless and give up, (4) leaders may utilize performance data as a strategical management tool but must not become solely driven by data and outcome measures, and (5) the ethical culture of the organization must be impenetrable thereby protecting the system from manipulation, fraud, misinformation, and trickery (Cohen 2009; Ordonez et al. 2009; Barsky and Kaplan 2007). The absence of these safeguards could undermine the performance culture and place the organization in perilous state. The following discussion highlights several of these issues in the Veterans Health Administration use of performance reforms.

## Ethics and the VHA

During the 1990s, the VHA encountered challenges regarding under funding, personnel shortages, extensive wait time for veterans to receive services, and other structural issues. In adherence with the Clinton Administration's efforts to reinvent government, it attempted to address these issues by utilizing performance management reforms (Kizer 1996). It restructured its headquarters, recruited a sizable amount of private sector talent that could infuse the use of business type practices, attempted to right size itself by reducing the workforce, mimicked the private sector, and significantly decreased the amount of hospital bed while drastically increasing outpatient services, developed performance measures, and goals that were design to enhance service quality and reduce appointment wait times, invested in building the infrastructure needed to record and monitor performance outcomes, expanded the use of performance pay models, and increased the dollar amount of executive bonuses for ensuring performance goals were achieved (see Table 1). While each of these efforts demonstrated a commitment to becoming a more performance-driven entity, evidence ensuring this was done in an ethical manner was somewhat lacking. The guidelines discussing how the objective of maintaining an ethical environment would be pursued was one of the least developed provisions in the VHA's 1996 strategic plan of action. It simply noted educational programs, contracts, and incentives would be utilized to ensure employees pursued performance objective in a principled manner but failed

**Performance Reforms, Ethical Issues, and the Veterans Administration, Table 1** VHA performance management reforms

| Objective | Action | Outcome |
|---|---|---|
| 1. Reengineer operations | •Restructure VHA Headquarters<br>•Recruit new talent | •25% reduction the workforce<br>•Largest infusion of private sector management talent ever |
| 2. Reduce operating cost | •Transition from hospital to ambulatory system | •Closed 42% of hospital beds in 15 years<br>•Increased outpatient visits 60% during the same time period |
| 3. Enhance the culture and promote excellence | •Manage by outcomes through performance contracts and incentives | •Increase the size of executive bonuses |
| 4. Increase access to VA services | •Decrease waiting times for appointments | •Require the achievement of timeliness goals by 1998 |
| 5. Promote individual and collective accountability | •Implement performance pay for executives and caregivers<br>•Develop incentives and rewards to promote teamwork and innovation | •Link pay to performance within statutory allowances<br>*focus on productivity and de-emphasize tenure<br>•Develop rewards to promote teamwork and excellence |
| 6. Promote a culture where individually and collectively VHA provides a model of ethical behavior and integrity | •Pursued through educational programs, performance contracts, and new awards and incentives | |

Kizer, Kenneth. March 1996. "Prescription for Change: The Guiding Principles and Strategic Objectives Underlying the Transformation of the Veterans Healthcare System"

to specify the details of how the programs would be actualized (Kizer 1996). The lack of emphasis on ethics increased the system's vulnerability to manipulation as employees developed strategies to meet performance targets, especially those linked to wait times for primary and speciality health care services.

The amount of time veterans were required to wait to see a doctor created major challenges for the VHA. Staff shortages coupled with a sizable increase in the number of clients seeking services resulted in some veterans waiting 270 days for a doctor's appointment. The extensive wait period was further complicated by the notation that veterans waiting more than 30 days were more likely to succumb to the ailment than those with similar health issues and receiving care in a shorter period of time (Prentice and Pizer 2007). Beginning in 1998, the VHA began to utilize annual performance targets designed to decrease the number of clients waiting for care longer than 30 days, thereby reducing the probability of death and deteriorating health for veterans (Prentice and Pizer 2007). By 2002, it had adopted an electronic waiting list that would assist in data collection and provide assistance in tracking and monitoring the achievement of annual performance targets. The investment in the electronic infrastructure was accompanied with training for employees on how to schedule appoints in the computer and financial bonuses for those providing evidence they met or exceed annual performance targets increasing the percentage of veterans receiving services within 30 days (Stanley 2005; VA Awards and Incentives 2011). Data assessment of the wait time for services after the performance reforms were implemented revealed great promise. For example, in 2005, employees were expected to achieve the aggressive target of ensuring 93% of those seeking specialty care services

**Performance Reforms, Ethical Issues, and the Veterans Administration, Table 2** VA Primary and Specialty Care Waiting Time Performance Targets and Outcomes

| Year | Target | Result | Target | Result |
| 2002 | 88% | 89% | 85% | 86% |
| 2003 | 93% | 87% | 90% | 80% |
| 2004 | 93% | 94% | 90% | 93% |
| 2005 | 94% | 97% | 93% | 95% |
| 2006 | 96% | 96% | 93% | 95% |
| 2007 | 96% | 97.2% | 95% | 95% |
| 2008 | 97% | 99% | 95% | 97.5% |
| 2009 | 97% | 97.2% | 95% | 98% |
| 2010 | 98% | 99% | 95% | 99% |
| 2011[a] | 93% | 94% | 93% | 95% |
| 2012[a] | 94% | 95% | 95% | 96% |
| 2013[a] | Baseline | 93% | Baseline | 93% |

[a]Note: Waiting period changed to 14 days for both primary and specialty care; Source VA Performance Accountability Reports for each respective year

were accommodated within 30 days (see Table 2). The performance results revealed 95% of clients were served. This high level of performance was consistent with previous years for both primary and speciality care. In 2010, approximately 99% of clients were seen in less than 30 days. The presence of challenging targets appeared to motivated employees to perform so well that the wait time was reduced from 30 to 14 days. Entities that had once struggled to grant soldiers access to care within 4–6 months were now able to perform accountability techniques and ensure 95–99% of clients were seen within 14 days.

Concerns regarding the validity of the reported outcomes led to federal investigations revealing data manipulation and other forms of malfeasance. Administrators at some locations developed secret waiting list designed to hide their inability to meet aggressive performance targets. Clients seeking appointments were first put on a paper list and only transferred to the electronic list when they could be served within 14 days. This had devastating effects for veterans in Phoenix, Arizona, where 40 patients died while waiting to be placed on the electronic list. The average wait time at the facility was 115 days and not the 14 days reported (Associated Press 2014). Veterans in Columbia, South Carolina, suffered a similar fate as 50 clients who received delayed access to gastroenterology consultations succumbed to their illness (House Committee on VA 2014). Sadly as these soldiers lost their lives, employees received more than $ten million for meeting performance expectations (Harris and O'Dell 2014).

Many of the guidelines designed to ensure the reforms were implemented in an ethical manner were never follow through with. For example, many VA clinics were understaffed and lacked the capacity to process the high volume of phone calls requesting appointment times (Associated Press 2014). This left schedulers feeling overwhelmed and helpless to change the situation. In other locations, staff responsible for scheduling appointments had not been properly trained, thereby increasing the error rate for the number of scheduled appointments (see Table 3). Oversight and monitoring functions were often not performed. This increased the stress level of some employees who reported being encouraged in some cases and aggressively pushed in others by higher-level administrators to manipulate the data and falsify appointment documents. Some agencies encountered problem due to the lack of funding to build the needed infrastructure, overworked and underpaid staff that felt powerless to achieve aggressive and lofty goals, and high stress and staff turnover rates.

**Performance Reforms, Ethical Issues, and the Veterans Administration, Table 3** Scheduling scenarios

| Scenario | Correct response | Number of responses | Percentage of correct responses | Percentage of incorrect response |
|---|---|---|---|---|
| The veteran wanted an appointment as soon as possible (not emergency) | Next available with a desired date of today. | 10,567 | 31% | 69% |
| The provider requested a specific time frame for a return appointment (return to the clinic in 6 months) | Not next available with a desired date of 6 months in the future | 9967 | 78% | 22% |
| The veteran is a new consult. | Next available with a desired dated of today | 6614 | 36% | 64% |

Source: Staley. (2005)

## Conclusion

Although performance reforms aim to enhance efficiency and effectiveness, provision promoting ethical action must be included in every stage of the process. During 1990, VHA utilized performance reforms to enhance operations. However, the inclusions of ethical safeguards were far less apparent than the performance provisions. Ultimately, the reductions in the workforce of an organization that was already understaffed, aggressive performance goal, poor training, lack of oversight, and intense pressure to hit unrealistic performance goals created an environment where performance reforms became the cure that was worse than an untreated ailment. In the future, performance reforms must include employees in the development phase. They must include realistic goals and include ethical provisions ensuring oversight and incentives for employees act with integrity.

# Performance-Based Budgeting Implementation: A Nonlinear System Perspective

Imane Hijal-Moghrabi
Public Administration and Leadership Program, The University of Texas of the Permian Basin, Odessa, TX, USA

## Synonyms

Performance-informed budget; Resources-performance linkage

## Definitions

The allocation of budgetary resources based on performance information; linking budget allocations to performance results.

## Introduction

Performance-based budgeting (PBB) can be defined as the "process for developing and incorporating measurements of the performance of government operations, services, and programs into the budget process, which is intended to introduce some rationality into a traditionally subjective and political decision-making process" (Willoughby 2011, 352). From an organizational learning perspective, performance-based budgeting can be viewed, not only as a control mechanism, but also as an "organizational learning mechanism" (Moynihan 2005, 203), allowing governments to learn about the well-functioning of their programs. In doing so, they can prioritize successful programs, eliminate unsuccessful ones, redirect resources from unsuccessful programs to new areas as needed, or take necessary measures to improve program performance deficiencies (Moynihan 2005). The use of performance information, which is at the heart of PBB, is intended to enrich policy debates and decision-making, to keep decision-makers informed at all stages of the budget process, to provide accountability by enhancing communications and transparency, to improve public services, and to promote more informed public.

As a budget innovation, PBB was first proposed in the 1950s as an alternative to the line-item budget which was in place as the primary tool for expenditure control. With performance budgeting, attention shifted from inputs to outputs, focusing mainly on activities and outputs – on things that could be identified and measured in terms of workloads and unit costs. However, performance budgeting of the 1950s was not smoothly implemented; several problems complicated its implementation, particularly at the national level. Outputs of governmental services and activities were found hard to measure, and performance budgeting as a tool lacked the potential to deal with long-term problems. In the 1990s, New Public Management reforms created a substantial demand for performance measurement and information. This renewed interest in performance measurement had resulted in the reemergence of performance budgeting as a tool of accountability to restore public trust in government.

Every administration taking office since the early 1990s has given performance measurement and performance budgeting special attention.

Under the Clinton Administration, two major initiatives were taken to improve federal government performance: (1) the National Performance Review, overseen by Vice President Gore, which aimed at improving customer satisfaction through setting customer service standards, and (2) the Government Performance and Results Act (GPRA) of 1993, which sought to improve the efficiency and effectiveness of federal agencies' programs by holding agencies accountable for the performance and results of their programs by requiring them to set program goals and to produce annual performance reports, including both performance measurement results and evaluations.

Under the Bush Administration, the President's Management Agenda (PMA) of 2001 viewed GPRA as a well-intentioned reform effort, albeit ineffective as a tool for performance management, emphasizing the need to allocate resources to programs that deliver results. One component of PMA was the Program Assessment Rating Tool (PART), which was developed by OMB to improve the effectiveness of the assessment process of different federal agencies' programs and to influence funding and management decisions related to them. Federal agencies were required to submit PART ratings for their programs along with their initial budget requests. As such, PART was conceived of as a form of performance budgeting, as it sought to enhance a resource-performance linkage and to hold agencies accountable for their programs' outcomes. However, just as GPRA, PART struggled and fell short of keeping up with its promises. However, despite their deficiencies, GPRA and PART succeeded in establishing "new organizational routines of data collection, dissemination, and review" aiming at fostering performance management practices (Moynihan and Lavertu 2012, 592).

The Obama Administration perceived the problem with GPRA and PART as a problem, not with the supply and quality of information, because both GPRA and PART already increased the production of performance measurements in most agencies, but with the actual use of it (Moynihan and Lavertu 2012). The Obama Administration sponsored the GPRA Modernization Act (GPRAMA) of 2010 which explicitly sets the goals of greater performance information use to improve management and results (Moynihan and Lavertu 2012, 592). GPRAMA aimed not only at strengthening the linkage between resource allocations and information but also at promoting its actual implementation and at engaging agencies with developing their own measures. However, recent GAO reports showed no significant change in the use of information in the period that followed the implementation of GPRA Modernization Act of 2010 (GAO 2014).

Therefore, despite all efforts to link budget allocations to performance results, PBB has not been fully implemented. Public administration scholars have observed that despite the fact that performance measures have been widely developed and incorporated into budget presentations, allocations of budgetary resources are still not made on the basis of performance results. This paper looks at the implementation of PBB from the lens of nonlinear systems models and analyzes the challenges that have made this implementation an objective hard to attain.

## Theoretical Underpinnings

Understanding why performance-based budgeting has not been fully implemented so far necessitates a grasp of the dynamics of organizational change and transformation. Organizational change occurs in response to external and internal forces. "Theorists of change and reform explain that it can come from the top-down or the bottom-up, through institutional reforms, reorganizations, and reinventions" (Farazmand 2009, 1009). However, whether in social or natural systems, change processes do not always follow a linear path. In other words, change is nonlinear.

Nonlinear models are models in which there is no linear relationship between cause and effect – a change in the outputs is not proportional to the change in the inputs. One interpretation of the nonlinearity of change processes is offered by chaos theory. The notion of chaos denotes "crises and disorder, a state of non-equilibrium,

instability with consequences of anxiety, fear of unknown, and triggering and tripling effects of destruction and system breakdown" (Farazmand 2003, 347). This notion has been "used interchangeably with other concepts such as nonlinear systems models, disorder theory, and dynamical complex theory" (Farazmand 2003, 347).

Understanding chaos theory requires "a deep understanding of the relationships between parts and whole, of segments and systems, and of dialectical relationships between constant and change, of opposing systems, and of stability and chaos, leading eventually to a new form of order and stability" (Farazmand 2003, 342). This understanding is essential because of "its significant implications for organization design and administrative behavior, and public-policy analysis and implementation" (Farazmand 2003, 342). Central to the concept of chaos is the concept of "punctuated equilibrium" – a phenomenon known as the "shaking and cracking state, a point at which a stable system is shaken and cracked and results in a fractuated state" (Farazmand 2003, 362).

## A Behavioral Interpretation of the PBB Policy-Making-Implementation Gap

The evolutionary process of systems going through changes does not occur in a vacuum. It is rather influenced and, even, shaped by the ecological context – the environment of which it is a part (Farazmand 2003, 2009). As such, forces of change are often met with external and internal forces/elements that keep the system in a state of stasis, thus obstructing the evolutionary process and, eventually, preventing change from occurring, hence the relevance of the policy-making and implementation gap to this discussion. Implementation, as Pressman and Wildavsky (1973) argue, is not an easy endeavor. Passing legislations and securing appropriate funds set up the initial conditions for implementation. However, in themselves, they are not enough for this implementation to take place. An understanding of why performance-based budgeting has not been fully implemented necessitates a closer look at those challenges that have obstructed its implementation. These challenges have to do partly with the features of the budgetary decision process and partly with the change process itself.

### The PBB Rationality Versus the Political Irrationality of Budgetary Decisions

PBB can be viewed as an approach to rationalize the budget decision-making process by linking performance results to budgetary allocations. This rationality stands in sharp contrast with the political irrationality of the budgetary process. One of the challenges to the PPB rationalistic model has to do with the nature of performance information (PI). Scholars, such as Andrews (2004), have debated the value of performance information and the difficulty in developing appropriate and relevant output and outcome measures, especially when measuring services that cannot be tangibly measured. Scholars also highlighted the ambiguity surrounding the interpretation of PI and how this information is to be used in the budget process (Moynihan 2005). Moynihan (2005) argued, when commenting on the inadequate implementation of PART, the PI is far from being neutral, which makes it hard to reach a clear consensus about its interpretation. This is often the case because ambiguity is one of the characteristics of organizational life. Another challenge relates to the rationalistic "performance culture" that PBB seeks to promote. Some scholars went to the extent to hold this culture responsible for violating the democratic principles of equity and social justice. By promoting efficiency as the prevailing value, performance measurement rarely provides the chance to emphasize the values of equity and fairness that many government programs are expected to achieve which, ultimately, strengthens the unsettled conflict between the values of efficiency and equity.

As a rationalistic approach to budgetary decision-making emphasizing the rational mechanistic link between performance information and budget decisions, performance-based budgeting ignores the fact that public budgeting is inherently political (Wildavsky 1964) and, ultimately, functions in a political setting, which complicates the separation of politics from the budgetary decision-

making process. A budget is more than numbers – more than a fiscal plan that determines and details a government's revenues and expenditures for a specific fiscal year. A budget is also a plan of action, a statement of preferences, and a document of political economy (Lee and Johnson 1998). As a plan of action, a budget is a policy document, reflecting the policy priorities of a government for a particular fiscal year. It is also a manifestation of government strategies (Lee and Johnson 1998), detailing different government activities, programs, criteria, as well as goals and means. As a statement of preferences (Lee and Johnson 1998), a budget reflects the attitudes, ideologies, and preferences of dominant power elites. A budget is a statement of preferences because elected officials at all levels of government are representatives of their constituents. They tend to support policies and programs that are valued by the people who brought them to power – voters, political parties, and, even, interest groups who funded their election campaigns. All this seeks to ensure that they will stay in power in next election. As a document of political economy, a budget reflects competing interests in a pluralistic democracy and determines who gets what, who wins and who loses, which programs are to be funded, which programs are to be eliminated, or which programs are to experience budget cuts. All this reflects the political and economic powers at play that dictate budgetary allocations in a way that often serves the dominant power elites. This is particularly true in times of economic recession, especially at the state level, whereby state governments are required by their constitutions to maintain a balanced budget.

As such, the budgetary process is more complicated than the rational allocation of limited resources among different activities, especially in a highly pluralistic democracy where it is supposed to serve the agendas of multiple stakeholders. In this seminal work, which has a lasting impact on policy-making theory, Lindblom (1959) provides insights into the collective political rationality (or irrationality). He observed that policy-making is characterized by conflict among actors, whereby most decisions are the outcome of compromises rather than optimization. Lindblom (1959) advocated "disjointed incrementalism" whereby decisions are approached incrementally, allowing decision-makers to consider and evaluate only relatively small number of policy alternatives and their important consequences and continuously adjusting and reframing their decision situations in light of feedback. Under this approach, decision-makers' preferences are determined by compromise; a good policy is, therefore, "the one which is agreed upon" (Lindblom 1959, 83). This theory was soon adopted and substantially developed in budgetary context by Wildavsky (1964) and other scholars. Budgetary incrementalism refers to marginal changes in budget allocations relative to some base, which is often the allocation outcomes of the previous year with a narrow range of increases and decreases – the method commonly used in the traditional, line-item budget. Given the political nature of the budgetary process and the compromises through which most decisions are made, Wildavsky (1978) contended that the incremental nature of the line-item budget is, perhaps, what makes this traditional budget survive despite its deficiencies, without being superseded by any of the budgetary reforms that have been proposed since the late 1950s.

Viewed this way, the political nature of government institutional setting creates special challenges for PBB implementation. To begin with, the public institutional setting is a web of multiple authoritative decision-makers. This implies multilevel systems of accountability and reporting relationships, which are a common feature in the public arena where several units – the legislature, the executive, the media, and the interest groups – have legitimate access to decision-making. This, of course, complicates PBB implementation, for it creates the need for building support and seeking consensus among groups. However, even if a consensus is reached on implementing performance-based budgeting, the continuity of such an effort is not guaranteed. Change in elected officials and, thus, the influence of their varying agendas, for instance, threaten the continuity of this budgetary tool.

Perhaps, the foremost obstacle to performance-based budgeting lies in the potential

incompatibility between PBB ideology and the way government works or is intended to operate. This is truly the case because political decisions are distributive in nature. They are often based on win-lose games – or the "who-gets-what mentality" – especially when distributing limited resources among competing stakeholders. Likewise, scholars have pointed out to the fact that policy-makers do not necessarily support the implementation of policies addressing change. In this sense, politicians may resist or, even, oppose the allocation of budgetary resources based on performance results for the mere fact that such information "may increase their vulnerability to constituencies, especially with regard to long-term programs that might not perform well in the short run" (Andrews 2004, 338). In addition to the short-term mentalities, elected officials are often reluctant to support the use of performance information, as this may reduce their discretion in budgetary decisions (Andrews 2004). Politicians may support the adoption and development of performance measures, but they may be very reluctant to support the allocation of funds on the basis of performance results – hence the relevance of the Garbage Can Model of Organizations (Cohen et al. 1972) to the interpretation of the policy-making and implementation gap.

*The Garbage Can Model of Organizations* (Cohen et al. 1972) describes decision-making behavior in organizations as organized hierarchies, whereby many decisions do not operate according to the rational choice model. Rather, an array of situational elements may restrict the cognitive abilities of organizational participants. Viewed this way, the garbage can model does not perceive decision-making processes as sequential steps that begin with a problem and end with a solution. As such, the model "does not specify any direct connection between the purpose and the intention of the actors and the events" to be explained (Cohen et al. 1972, 48). If policy-making operates like a garbage can model, the linkage between policy-making and implementation appears to be fragile at best, with little hope to document successful implementation. This is truly the case because policy-makers often do not care much about implementation. In this sense, demonstrating a will to change things through policy-making may be more important than implementation.

### Nonlinearity and Difficulty of Implementation

While organizations need to change in order to adapt to their environment, not all change processes can be actualized. This is particularly true when dealing with large-scale, chaotic changes. For such changes challenge the deep structure, that is the culture, of an organization by causing "a jolt or a perturbation to the system" (Burke 2013, 76). In this sense, a full implementation of performance-based budgeting can be regarded as a large-scale change that is expected to generate fundamental changes to the budgetary practices as well as to the culture of a given governmental unit, which can be disruptive and, even, threatening to the organization in question.

Nonlinearity is one of the most salient characteristics of change (Burke 2013). This is also true for the policy-making and implementation processes that do not always follow a linear path. As it is often the case, things do not proceed exactly as planned; unintended consequences that we did not anticipate at the outset start surfacing later in the process. "Some people resist or even sabotage the process; and some people who would be predicted to support or resist the plan actually behave in just the opposite way" (Burke 2013, 10). This explains why change is often experienced as "messy if not chaotic" (Burke 2013, 7). In this sense, reformers thought that increasing the capability of government organizations to develop their measurement systems and to collect performance data would, eventually, result in the use of this data in budgetary decisions. But this was not the case. While governments at all levels have developed some form of performance measurement systems, performance information is still not incorporated in budgetary decisions in any distinguishable way. The Obama Administration perceived the real problem not with the shortage of performance information but rather with the actual use of it (Moynihan and Lavertu 2012). The nonlinearity of change processes explains why the implementation phase of an innovation is, in general, more complex and challenging than its adoption phase.

### Bureaucratic Inertia and Resistance to Change

One of the major obstacles hindering the implementation of any new effort is resistance to change. A prominent source of resistance to change is bureaucratic inertia. Wildavsky noted that the introduction of new procedures that result in new policies is not easy. This is often the case because "bureaucratic inertia" – "the forces of conservatism within government resist change" Wildavsky 1978, 501). One of the endogenous elements inducing bureaucratic inertia/resistance is organizational routines. In *A Behavioral Theory of the Firm*, Cyert and March (1963) underscored the centrality of routines to organizational functioning. They viewed a large replacement of routines as a complex undertaking, highlighting the path dependence of routines that may obstruct the adoption of new routines such as new technologies, programs, policies, and processes.

In addition to the political institutional setting that renders the implementation, and sometimes the initiation, of change in the public arena often problematic, the bureaucratic nature of governmental institutions has always been regarded as a prominent source of resistance. This is particularly true because bureaucratic organizations promote a culture of conformity in which behavioral consistency is often perceived as a virtue – "the heart of logic, rationality, stability, and honesty" (Kelman 2005, 19). Such a culture limits employees' competence and ability to adopt new behaviors. Resistance to change is, further, strengthened by the lack of incentives, for the environment in most governmental organizations is set in such a way to punish error rather than to reward and encourage excellence.

Furthermore, change is easier when it involves adding an innovation to an existing practice than when genuinely transforming an existing practice (Kelman 2005). The latter form of change requires modification of organizational culture – that is, "the embedded individual behavior patterns or ways the organization has been structured" (Kelman 2005, 5). However, culture is very hard to change. One significant characteristic of any culture, whether national, organizational, etc., is its antifragility – its ability to generate more resilience in the face of changing conditions.

## Conclusion

A budget is not context-free; it is not prepared, nor debated, in isolation of its ecological surrounding. This environment, whether political, institutional, social, or economic, greatly affects and shapes the budget's direction. The aforementioned discussion leads us to conclude that budgeting is not value-free, nor is it void of theory, as some might argue. The fact that budgetary decisions are the output of a network of interactions among the different actors in the budgetary process (both external and internal) suggests that the budgetary process does not follow a linear path. In other words, the budgetary process is nonlinear though it may appear to be otherwise.

This study looks at performance-based budgeting from the lens of nonlinear systems models and provides a behavioral analysis of the external and internal forces that have obstructed its full implementation. As viewed by Pressman and Wildavsky (1973, xiv), "implementation does not refer to creating initial conditions. . .A lack of implementation should not refer to failure to get going but to the inability to follow through." In addition to passing legislations and securing necessary funds, setting up the initial conditions for implementation also involves creating the structure and culture that are necessary to guide a successful implementation.

A full implementation of performance-based budgeting is intended to create a paradigmatic shift, not only in the budget systems but in the organizational setting as a whole. This shift is supposed to shake and crack the system in place and transform it into a new state – a new order. Inherent to this breakdown and renewal cycle is organizational learning. Organizational learning entails an observable organizational change in organizational behavior (Levitt and March 1988) through altering routines that guide behavior (Cyert and March 1963; Moynihan and Lavertu 2012). For this learning to materialize, single- and double-loop dynamic learning models are deemed necessary for both structural and cultural transformation. Structural transformation involves change in structure, processes, and procedures, which can be made possible through building governance capacity – the capacity "to work institutionally,

technologically, and professionally" (Farazmand 2009, 1013). Cultural transformation, on the other hand, denotes a fundamental shift in organizational culture, behavior, and mind-sets, emphasizing the promotion of a "culture of learning" (Schein 1992). Essential to this transformation is the role of sustained, inspired, and mission-driven leadership.

P

## Definition

Performance governance system to ensure that goals and objectives are being reached efficiently and effectively in budget limits terms. This system represents a combination of rules, principles, laws connected with actions, indicators, measurable target, and metrics.

## Performance Governance in the Russian Federation

### Early Attempts at Introducing Performance Management

Performance governance in its modern shape in the Russian Federation dates back to 2004, when

the government introduced so-called DRONDs (rus. Доклад о результатах и основных направлениях деятельности (ДРОНД) – Report on Results and Main Activities (RRMA)). These reports aimed at establishing a link between budget items and objectives of regional and federal government agencies. The structure of the report corresponds with its title – it had a section on achieved results, a section on plans for the next 3 years, and a section with indicators linked to aims. The implementation of DRONDs was performed within the efforts to establish 3-year budget planning. According to an expert of the Ministry of Finance, who was in charge of the implementation of DRONDs, the very task of linking budget spending to outputs and outcomes was unheard of and required intensive communication and capacity building at the regional level. Gradually, regional officials have "learned the language of targets and indicators" and have started preparing the reports and plans.

The first 3-year federal budget was passed in 2008 and partially integrated the target-setting section of DRONDs.

However, the implementation of this first performance management tool has not resulted in an introduction of a comprehensive system of performance budgeting. These reports were not binding and gradually devolved into noncompulsory indicative plans that were largely perfunctory. The practice was not enforced by the federal center and gradually faded away by 2010 (Kalgin 2016). However, its contribution in establishing the common language of performance management was of value.

It should be emphasized that system of performance governance in Russia is decentralized. It means that different levels of authorities develop goals, strategies, and programs and implement their at its own discretion. Until recently in Russia did not exist one authority for the implementation of results management and strategic improvement. But in June 2016, by the decree of the President of the Russian Federation, the Council for Strategic Development and Priority Projects was established. Among the main tasks of the Council is preparation of proposals to the President of the Russian Federation on the development, implementation, and actualization of goals on the main directions of Russia's strategic development. The Council is called upon to coordinate the activities of federal and regional authorities, expert, and business communities related to the implementation of priority projects, analyze, and evaluate the implementation of these projects.

### Main Directions of Government Activity

In 2008 the government has introduced the Concept for Long-Term Socio-Economic Development of the Russian federation until 2020 (Concept 2020) (Rus. «Концепция долгосрочного социально-экономического развития Российской Федерации на период до 2020 года») and Key Directions of Government Activity (KDGA). (Rus. Основные направления деятельности правительства). This began the new era of formal target-setting at the national level. The idea behind these documents was to establish a set of unified top-level objectives and to harmonize the remaining strategic documents with it, thus giving the civil service a sense of general direction.

The KDGA were structured around 60 core national projects each of which had a set of performance indicators (Klimenko et al. 2014). This was an attempt to link budget spending to economic and social outcomes. Each project had a "roadmap" of implementation with forecasted outcomes and various scenarios linking levels of budget spending to outcomes.

This ambitious project, however, faced the harsh reality of 2007–2008 world economic crisis. The plans for implementation of the Concept 2020 and KDGA did not materialize due to budgetary constraints.

### Performance Reporting at Regional and Local Level

In parallel with the demise of the DRONDs, the federal government has rolled out a set of new performance initiatives. In 2007 and 2008, two government degrees have established the new framework of performance reporting at the regional and the local level. In contrast to DRONDs that delegated significant autonomy to

regions in choosing performance indicators, the new system (commonly referred to by the numbers of the degrees – 825 and 607) established a unified list of indicators and provided no room for local discretion in reporting. The data were collected by the Ministry of Regional Development and became basis for a national system of performance measurement and benchmarking.

The system presented a significant shift towards greater centralization of performance measurement and accompanied the establishment of the "vertical of power." Since the abolition of gubernatorial elections in Russian regions in 2005, lost their political independence from the center and largely became administrative agents of the federal center. The system of performance reporting under degrees 825 and 607 established direct bureaucratic accountability between regional heads and the federal center. The system was used to run annual benchmarking campaigns, rank regions in terms of economic and social development, and allocate federal grants. The system generated significant dissatisfaction among regional authorities, who complained about inconsistencies in methodology of rankings, lack of resources for collecting the data, and excessive burden of reporting. Concerns have been raised regarding unintended effects of such performance reporting, including evidence of data manipulation (Kalgin 2016).

The set of indicators that were compulsory for the regions was constantly growing and reached 325 indicators by 2012. Indicators covered most aspects of socio-economic development. The breakup by spheres is provided below.

Till now system of strategic goals at the federal level is not fully synchronized with the local goals and strategies. Thus, performance planning at regional and municipal levels needs to be optimized (Table 1).

The steady expansion of the list of indicators made the system costly and inefficient. The list provided not priorities for regional governments, reporting for such a large number of items was costly and time-consuming (Kalgin 2012). The system was replaced in 2012 by a more compact and flexible system of reporting under decree 1199. The list of indicators was cut from 325 to 11 core national indicators (Table 2).

## Government Programs

The 2007 economic crisis did not stop government attempts at implementing a comprehensive system of performance management. Since 2010 until now, the main instrument of performance management in the Russian government has been the Government programs. Program-based budgeting has dominated the budget reform agenda (Klimenko et al. 2014). By the present moment (2017), 44 government programs in 5 crucial directions are being implemented in Russia. The government portal programs.gov.ru compiles and presents information about content and realization of government programs.

**Performance-Based Governance, Russia, Table 1** Groups of indicators collected according to Decree 825 (Source: Kalgin 2016)

| Sphere | No. of indicators (% of total) | No. of indicators tied to grants (% of total) |
|---|---|---|
| Health care | 80 (25%) | 27 (43%) |
| Economic development | 44 (14%) | 6 (10%) |
| Vocational training and education | 43 (13%) | 0 |
| Secondary education | 42 (13%) | 16 (25%) |
| Communal services | 40 (12%) | 4 (6%) |
| Public administration | 26 (8%) | 7 (11%) |
| Housing | 15 (5%) | 3 (5%) |
| Energy efficiency | 14 (4%) | 0 |
| Environment | 10 (3%) | 0 |
| Roads | 6 (2%) | 0 |
| Security and policing | 5 (2%) | 0 |
| Total | 325 (100%) | 63 (100%) |

**Performance-Based Governance, Russia, Table 2** Core performance indicators under Decree 1199

| |
|---|
| 1. Life expectancy at birth |
| 2. Population |
| 3. Capital investments (excluding budgetary investments) |
| 4. Goods and services turnover by small and medium-sized enterprises |
| 5. Tax and non-tax incomes of the regional budget |
| 6. Unemployment rate |
| 7. Real disposable household income |
| 8. The share of newly build housing in total amount of housing |
| 9. The share or high-school graduates who did not pass the national exam |
| 10. Mortality rate |
| 11. Citizen satisfaction with the performance of the regional government |

Government program provide a tool to link budgets with projected outcomes. They ensure that various government agencies subscribe to implementing a set of projects and are accountable for achieving a set of objectives.

Programs are implemented all levels of government. It is a common practice for heads of government agencies to have the progress indicators of programs as their KPIs (Klimenko et al. 2014). Budgets at the regional level now include programs as their integral part.

In addition to government programs, every responsible public authority must develop plan for program implementation for the next 2–3 years. It provides a list of control events and the schedule of their implementation, the amount of financial resources allocated for their implementation from the federal budget, consolidated budgets of regions, extrabudgetary funds, and nonstate sources.

Every program has strong evaluating system including many performance indicators. Indicators and schedules, which reflect the timing of the implementation of control events, are often the basis for the establishment of KPI executives department. The report on the implementation of the activity plan is the main reporting documents of the Ministry; it is based on reporting on the progress of the implementation of government programs.

## Strategic Planning

Another dimension of performance management that has been recently gaining popularity in the Russian government is strategic planning. Strategies of all types have been proliferating. In 2014 the federal law №172 (Federal law №172 «On strategic planning in the Russian Federation», 2014) has established the framework for strategic planning at national, regional, and local levels. The aim of these efforts is to implement a harmonized system of objectives, forecasts, and indicators that would allow for an effective functioning of the public sector. Significant efforts have been made to establish a unified methodological approach to strategic planning (Klimenko et al. 2016).

Effective system of strategic planning is extremely important in budget deficit period. It should be considered that strategic planning is only one element in global system of strategic management. It will allow changing the approach to a governmental and nongovernmental forecasting, ensuring coordination of development, realization of long-term strategies on different levels of authority, creating up-to-date standards of development management, and supporting public dialog with civil society.

The general framework of performance management is represented in the Table 3 below.

## Problems and Criticism

The implementation of performance management in the Russian Federation has been an ever-lasting effort. Currently, the PM ethos is well integrated in the fabric of government operations. Performance indicators have become an integral part of all major government concepts, plans, and strategies.

It has to be noted, however, that there are significant drawbacks. Performance reporting has been costly and often burdensome. There is widespread skepticism at the regional level regarding the usefulness of performance measurement (Kalgin 2012).

More generally, the system of performance management and strategic planning in Russia operates in a highly centralized bureaucracy that is largely insulated from political competition.

**Performance-Based Governance, Russia, Table 3** Performance management framework in the Russian Federation (Source: Kalgin 2015; Zhigalov et al. 2009)

| Federal strategic documents | Goal setting and planning tools | Administrative tools enabling achievement of goals and objectives | Performance Measurement Tools |

[a]Presidential Decree № 1199 "On assessing the effectiveness of executive authorities of the Russian Federation.", 2012
[b]Presidential Decree № 825 "On the evaluation of performance of the executive authorities of the Russian Federation", 2007
[c]Presidential Decree № 607 "On the evaluation of performance of local governments in urban districts and municipal areas", 2008

Efforts to implement bureaucratic accountability and top-down goal-setting in such a system attempt to replace regional and local political agency. The adequacy of such a substitute seems dubious.

Thus, in the Russian Federation during the last decade, quite a number of instruments of strategic management have been implemented. However, this has not yet had an obvious effect on the quality of public administration, increasing the likelihood of achieving set goals, seeking innovative solutions, and improving the country's competitiveness.

# Performative Consequences of Measuring Performance: Insights from Health-care Contexts

Tom S. Karlsson and Cemil Eren Fırtın
School of Public Administration, University of Gothenburg, Gothenburg, Sweden

## Synonyms

Constitutive and generative accounting in health care; Practice view of health care accounting

## Definition

Performativity in the broadest terms is about active agency of object in relation to its subject. In particular, it is a framework in which scientific knowledge (or the epistemic object) is understood to be constitutive for its own empirical existence by affecting organizations and their actors (or the empirical subjects). In health care accounting, performativity is about the constitutive and generative role of accounting practices in bringing about the economizing of medical professional context.

## Introduction

During the second half of the twentieth century, public sector organizations (PSO) were increasingly subjected to a number of different reforms aiming at increasing efficiency and accountability. These reforms are more commonly known as *new public management* (Hood 1991). PSOs have got under excessive calculative practices which has paved the way for an economization of public service (Funck and Karlsson 2020). This chapter focuses on the use and importance of accounting as a central device of calculative practice.

Accounting has been framed as playing an important role in the transformation of PSOs (Lapsley 2007). Different techniques were introduced because of an existing trust in markets and a rather low trust in public servants and professionals (Hood 1995). Through the use of accounting, instances of cost control and increased accountability could be implemented. Evaluation of professional activities became highlighted and increasingly advanced ways of calculating costs were introduced. The latter is labeled *accountingization*, meaning an implementation and increasing use of different cost categorizations in contexts that had previously been focused on aggregated costs and governance through financial input.

The use of accounting techniques is closely related to calculations and a general reliance in numbers. Critical accounting scholars argue that the use of numbers serve as a means for making complex empirical relations less complex, instigating a sense of (false) objectivity (Kurunmäki et al. 2016; Robson 1992). Making use of calculations and calculative technologies, such as, e.g., accounting, means that comparability across different organizations and contexts can be undertaken as complexity is reduced. Although it could be questioned whether all comparisons really are reliable, the mere possibility of comparison brings about changes in organizations. Accounting can – and will – affect how actors engage in organizational and professional work.

From this backdrop it follows that accounting is more than a neutral set of techniques for measuring and comparing activities (Miller and Power 2013). Accounting transforms complex empirical patterns – such as, e.g., professional work – into quantified accounts, which in turn can be used for accountability purposes or, if deemed acceptable, individual or organizational remuneration. In this respect, accounting has a performative power to transform PSOs and (re)describe professional work (Fırtın and Karlsson 2020).

## Accounting, Performativity, and Health Care Sector

The increasing use of calculations and accounting techniques has led to an expanded use of *performance measurements* within PSOs. Measurements of resources, costs, outputs, processes, and even people and their activities have been studied by researchers. It has been argued that the use and reliance of performance measurements – as a way of *accounting* for something that has happened – carries performative implications. What this means is that performance measurement affects not only the individuals within an organization but inherently affects the organization itself. From this perspective, a direct association can be made between performance measurements and what is known as *the performative turn* in accounting research (Vosselman 2013).

Stemming originally from linguistics, performativity as a concept has been developed and applied to different fields of research, from gender studies to economics and to accounting. Recognizing their ontological differences, the performativity concept shares a commonality in considering the subject not only as the individual (active) actor engages in action, but also the object as an effective part in the performance of that action (MacKenzie 2006). In terms of accounting, this means that accounting is not only a technology of reporting numbers used by someone, but is understood to be an actor itself. Therefore, accounting may have the agency to shape its users to do certain specific things (Vosselman 2013), and sometimes it may change the context in which it is practiced (Fırtın and Karlsson 2020). The proverb of "what gets measures gets done" is applicable. Not only are accounting directing attention towards things that should be done, it also affects how actors perceive things within organizations. If a certain activity is measured it will be done, not only because it is measured, but also because it is perceived as important within the organization. In terms of performance measurements, this entails that the measurement systems, structures, indicators, established criteria, routines, and/or processes would be as effective as the assessor in grading, ranking, and/or attributing some certain value for the object to be measured. Once such structures, processes, criteria, and indicators are constructed by human–nonhuman *agencements*, they could not be treated as merely submissive to the assessor, but contrarily may actively affect the assessor in his/her performance of measuring. This means that accounting has an active role on its users by enforcing them to choose which criteria or indicator should be used during an assessment process. However, this does not mean that such process would always be neat. The use of same criteria, indicators, and assessments grounds may not always shape the accounting objects to perform in terms of expected ways but may also lead to unintended consequences such as gaming, and even "bullshitting" (Macintosh 2009). In such situation, although accounting would still be in play to shape, maneuver, and direct its objects in certain ways, it would not be in a way that was intended when constructing the performance criteria. Accounting could therefore be both performative and counter-performative at the same time (Fırtın and Kastberg 2020).

A performative understanding of accounting necessitates an approach from a practical perspective, meaning that accounting comes into effect as it is performed. Such practical approach has been illustrated, e.g., within management control (Ahrens and Chapman 2007). Accounting is in play as long as the assessor engages in the measurements, the objects are submissive to assessments, and there are techniques and technologies, competences, and skills available for the assessor to measure. Under such circumstances and arrangements of things and people, accounting will be performed and even come to be through organizational actions of such actors (Callon 2007). This enable a second aspect for understanding accounting as performative. It is more than an abstract visualization of organizational situations and contexts presented in numbers. It is a practice which human and nonhuman members of an organization enact collectively (Fırtın and Karlsson 2020).

## Insights from a Health Care Context

In many countries and national contexts, health care is considered to be an important and large part of the public sector. Understanding how care is undertaken, what it costs, and what it produces is a core interest for patients, professionals, and politicians. Its large size in terms of stakeholders and complex financial structure together with its dependence on technologies, skills, and professional competence and the fact that it sustains peoples' lives and welfare make it a highly interesting research context for scholars.

The use of accounting within health care contexts carries a long history (Chua and Degeling 1993). Accounting has facilitated some kinds of activities while hindered or affected others. In this section, a specific focus will be kept on the emergence of performative consequences of accounting within the health care context (Fırtın and Karlsson 2020). In understanding performativity and performance of accounting, we will firstly highlight accounting as a modifier of medical contexts. Subsequently, we will illustrate the embeddedness of accounting in modern medical profession, and draw some conclusionary remarks.

### Accounting as Modifier of Medical Context

Health care has traditionally been about making diagnosis about patients' health and – when necessary – caring for their well-being. With the growth of modern and complex health care systems, accounting has been implemented more increasingly as a manner of monitoring costs and performance. It has also been demonstrated how accounting has been implemented as a way of shaping or affecting health care systems. One such reform concerns the introduction of formal management accounting systems such as diagnosis-related groups (DRG) (Chua 1995) or case mix systems (Lowe and Doolin 1999). So-called DRG system is a way of integrating accounting in health care by categorizing patients in relation to certain diagnoses. The system is tightly interlinked with issues of organizational reimbursement, where more complex diagnoses are intended to get higher reimbursements than less complex ones. For a brief description, the DRG system itself is an example of how accounting is continuously modifying the medical context. The categorization (accounting) with connection of financial reimbursement (calculation and valuation) affects the financial structure of the organization.

Another example of how accounting modifies medical contexts can be found in *value-based health care* (Porter and Teisberg 2006). Value-based health care concerns firstly a reformation of clinic-based professional health care and secondly an elaborate accounting of patients' health after treatments (i.e., the perceived value of care). Value-based health care integrates accounting as a necessary technique for altering and modifying how health care is organized by attaching a certain value to patient types and connecting this value with the organizational and financial structure.

DRG systems and value-based health care are two examples of diverse and numerous implementations of formal accounting systems within health care sector. To extend the role of accounting in modifying the health care context, the practice of accounting beyond formal systems needs to be scrutinized. This means that accounting can be found in less "radical" reforms. One of these concerns how patients are handled when arriving to emergency units. Conventionally, all patients that seek emergency health care undergoes a *triage*. This means that nurses or physicians make a first assessment concerning the urgency of a patient's health. The rationale is that the most urgent cases should be handled first, whereas less urgent cases can wait. A growing problem, however, in emergency health care concerns *crowding*. This occurs when there are so many patients within the emergency unit that treating them is impossible. Instead, physicians are merely replying to emergency calls rather than diagnosing and treating patients. This means that treating patients quickly, in order to reduce crowding, becomes a necessary activity. Crowding can also be reduced by engaging an efficient categorization of patients before they come into the emergency unit. This can lead us to find connections between use of prioritization, focus on time, and reduction of patients, and accounting. It concerns a construction of

accounts, placement of patients within such accounts, and a strive towards increased efficiency. Patients accounts together with the use of ranking and prioritization is a consequence of the performative mechanisms in accounting, inherently modifying the medical context.

### Embeddedness of Accounting in Medical Profession

Accounting is ever present in health care, and it is affecting how medical professionals understand and treat patients. The use of, e.g., the triage can be argued to be a core medical activity. It is necessary to understand and know which patients should be treated first. After all, lives are at stake. But there is more to it. Normally a patient seeking care at an emergency unit will be designated to a certain team after the triage. Such teams can be labeled with a color (cf. Sjögren and Fernler 2019) or a number (Fırtın and Karlsson 2020), indicating importance and priority. The idea of crowding itself can be understood as a way of constructing a number (patients) giving restrictions or maneuverability (performativity) within an organization. Both examples can be understood as organizing through the use of numbers. The sorting is a way of creating patient accounts, with a clear association between correct patient and correct account (colored or numbered teams).

Other examples of how accounting becomes embedded in the medical profession can be found in the way that physicians talk and reason about different types of patients. Calculations (Chua 1995) and talk (Fırtın and Karlsson 2020) about time per patients are more increasingly found within health care contexts. One example is the definitions of patients that are old and/or have multiple diagnoses as time consuming. Although the calculations of how much time each patient gets with a physician is not a new thing, the fact that it can be heard from physicians as they talk about these patients indicate how ideas about efficiency and accounting have become embedded in the everyday medical practice within health care. This shows how accounting can be existent within the medical professional context, perhaps not always as in the shape of formal techniques, systems, and structures, but may also be found in informal and disguised ways.

## Conclusion

This chapter has argued that accounting is not merely a neutral set of techniques for measuring and comparing different contexts (although it can do that as well). It is a mechanism for transforming complex empirical contexts into (less complex) patterns. This transformation also affects individuals' behavior within organizations. Accounting highlights certain actions and behavior as more favorable than others, thereby directing attention to such actions. This is what is referred to as accounting being performative.

Accounting has been existent within the health care sector in a scale from more formalized, structured, and radical forms to more informal, embedded, and disguised ones. The differences in such accounting forms have been argued to bring about diverse consequences into the medical professional sphere. However, in search of performativity, although being relevant, such differences in accounting forms have secondary importance. This is because performativity would be found in the practice of accounting (Callon 2007; Vosselman 2013). Therefore, one premises that a performative outlook to public sector accounting can be noted as having a practice approach to accounting and calculative applications, regardless of focusing on the formal systems, structures, and forms of accounting. In other words, a performative understanding would require the descriptions of how accounting unfolds within a process. The introduction, implementation, and internalization of accounting in health care contexts do not simply happen. It is a process that takes a long time. Accounting comes to be as individuals within organization make use of it and as it unfolds in practice (Ahrens and Chapman 2007). From a health care perspective this means that by calculating and measuring different activities or patients, accounting is being made. By itself, this should not be a problem. Accounting plays an important part in understanding how or why things are going as they are.

However, this is not to disregard the (empirical) outcomes of accounting forms. While aiming for using the public resources in an efficient way, if accounting becomes the primary, or only, mechanism by which the health care is governed, it could be harmful. Physicians' and other medical professionals' understandings and experience are very important in balancing health care units. In such ways, the consequences of health care accounting should be considered within a plurality of perspectives including accountability, professional, and wider health policy outlooks.

Although there is a growing literature focusing on accounting as performative, more studies are needed. Such studies should delve into the performative consequences over time and space. Diverse contexts should be studied in, preferably, a longitudinal study. Ongoing (re)descriptions of practices and medical professional work are affecting how we understand health care (Fırtın and Karlsson 2020), and more knowledge is needed concerning how such (re)descriptions become manifested in organizational activities.

# Personality and Leadership

Shariá D. Hall
Lincoln University, Lincoln, PA, USA
Hofstra University, Hempstead, NY, USA
Monroe College, New Rochelle, NY, USA

## Synonyms

Executive leadership; Leaders; Leadership; Personality; Transformational leadership

## Definition

Personality is the complete, unchanging characteristics and traits of an individual. These attributes whether good or bad, productive or unproductive, influence behavior and determines an individual's response. Personality is an intricate part of a leader and a leader's ability to motivate and sustain themselves and the group. Personality is most often observed through the temperament, feelings, and subsequent behavioral responses of the individual. Personality is measurable, influencing cognition and behavior. Personality is developed throughout adolescence and later adulthood and is the complete development of psychological coordination. Personality follows patterns and is instinctive to the individual.

Leadership is the influential, significant, and dominant persuasiveness of an individual to motivate a group (and those individuals within the group) to collectively set aside personal objectives and purposes for the mutual welfare of the greater community and this can be achieved with positively & negatively. Leadership is the strategic impetus to organize groups in the implementation and achievement of goals centered on a larger overarching vision or plan. Leadership must be defined through functionality; leaders must be able to systematically and continuously build the group and widen the team experience. Leadership is transcending and transformational. Leadership discovers potential growth possible within a group and actively cultivates an environment for effective advancement. Leadership assessment is made through the effectiveness of both the leader and the group.

## Introduction

Although not always recognizable, personality and leadership hold a correlating relationship. Earliest studies in the areas of personality and leadership reveal that a leader's personality and behavioral response (or lack of response) determine success or failure. Organizations have used and instituted the use of personality indicators to establish behavioral patterns. Personality measurement tools are used in hiring practices and are useful instruments in aiding to determine ideal candidates for positions and assess character. These studies have established that personality cannot be separated from the leader. Examining personality and the influences which shape character, these assessments identify factors which can adversely affect the organization and the individual. Leadership is influenced by personality, but in no way should leadership be domination. Instead leadership is a persuasive influence that should look to the best interest of the group. Leaders are captivating and engaging; their personalities reflecting traits with high levels of stamina, resolve, sociability, ambition, and emotional control.

## Personality Instruments

Personality research primarily comprised how individuals perceived themselves and how others perceived them. In his research, doctor of neurology Sigmund Freud categorized the individual in three types: erotic (those who need love and need to be loved), obsessive (inner-directed fixation), and narcissist (individuals fixated with themselves and crave adoration). Freud believed that the three types held some overlap and that all individuals have a degree of narcissism. Now various types and tools for measuring and defining personality exist.

The Myers-Briggs Type Indicator (MBTI) is a psychometric instrument that is most widely used. Reflecting the work of Swiss psychologist Carl Jung, individuals are classified according to four personality types: extroverted or introverted (E or I), sensing or intuitive (S or N), thinking or feeling (T or F), and perceiving or judging (P or J). The instrument marries the two mental functions of judgment and perception and insists that however different we are more alike than unlike. Within these framework individuals are visionaries, organizers, and conceptualizers. *Introverted Intuitive Thinking Judging* (INTJs) are visionaries, usually executive or senior leaders exerting strong influence. Managers, also influential leaders are *Extroverted Sensing Thinking Judging* (ENTJs) and

organizers. The research established through the use of this and similar tests shows how personal characteristics affect leadership but does not establish why some leaders become more narcissistic in their roles or more unethical. However, it is not clear on whether these traits indicate leadership skill or talent.

## Trait Theory

The five factor model of personality (referred to, as the "*Big Five*") is another instrument used to measure personality. The Big Five traits also include extraversion, but they are broader global traits that correspond with the work environment. The Big Five include neuroticism (poor emotional stability over control of emotional reactions leading to anxiety, insecurity, and hostility), extraversion (highly social, engaging, and interacting), agreeableness (trusting and caring), conscientious (achievement and dependability), and openness to experience (candor, imaginative, autonomous, and unconventional). The patterns within the Big Five give greater understanding to overall team performance. The traits of agreeableness, conscientiousness, and emotional stability are considered necessary and important antecedents for ethical leadership. Transformational leadership (*leadership between leader and team where both work together to identify needed change and build a blueprint to guide the organization through change*) incorporates these three traits of personality.

### Core Self-evaluations (Self-concept)

Self-esteem, self-worth, internal locus of control (beliefs about the causes of events in ones' life), self-efficacy (how well one can situationally perform), and neuroticism all create an individual's central concept of themselves. Determined, confident, and positive these individuals encourage use contingent reward leadership and support talent and individual consideration. Leaders demonstrating core self-evaluation as a primary trait have been found to be transformational leaders who are willing to challenge status quo and are free from anxiety.

### Narcissism

Considered the dark side of personality, narcissism's earliest accounts are in Greek mythology and the account of Narcissus, a man who fell in love with his own reflection. Freud categorized narcissism as a personality disorder. Bellicose, narcissistic leaders demonstrate an intolerance to compromise and immodesty. However, these leaders often attempt overarching initiatives and goals which can produce high organizational performance. It can, also, produce severe fluctuations in the organization leading to moderate success or overwhelming failure. Cultivating insecurity and dependency within followers, this response of diffidence is welcomed by the narcissist who craves adoration. Opposing contingent rewards leadership, narcissists have a lack of concern for others and share no correlation with transformational leadership. Contingent reward leadership is utilized by the narcissist when it provides personal benefit and while seeking promotion or status to achieve a personal goal. The narcissist has a tendency to be braggadocios and boastful often over exaggerating accomplishments. Preoccupied with power, narcissists are elitist, aggressive, arrogant, and have an insatiable drive for superiority. Narcissists can pose a significant threat to organizations as their drive leads them to develop highly involved strategies and initiatives which may prove disastrous to the organization and performance.

### Machiavellianism

Author of *The Prince*, Niccolo Macchiaveli, introduces deception, craftiness, and cunning in behavior. Macchiavelists disregard order and authority and concern themselves with achieving personal goals. Macchiavelists are identified as being duplicitous in nature, focusing on self-gain. Other personality traits include proactive personality, risk-taking, and self-monitoring (*expressive control and understanding how individuals and groups will interpret ones' behavior*).

## Attitude and Perception

Attitude and perception are pivotal parts of personality and leadership. Perception is constructed

through the individual's culture, social, psychological, physical, and biological contexts. As personality influences behavioral responses, perception influences how things are viewed. Within the perceiver attitudes, motives, interests, prior experiences, and expectations work in conjunction with time, work, and social setting (*factors in the situation*) to affect how things are perceived. Selective perception stresses any characteristic that causes the individual, an object, or event to be emphasized. As it is impossible to know or recognize all things occurring in the individual, we practice selective perception. Selective perception can produce a "halo and horns effect" as the individual can reach an inconclusive impression based on a solitary perspective. Our reactions shape our interaction and influences others encountered. Misrepresentations lead to misinformation and can grossly affect a leader's decision-making. Misrepresentation can lead to distortion affecting promotion and success. Distortions created through prejudices produce unhealthy behavioral response and bias. Biases cause individuals to be fixated on initial knowledge (i.e., first impressions) and can produce selective perception. Selective perception can also lead to judgmental responses, stereotypes, and marginalizations. Attribution theory suggests that in observing behavior the observer tries to determine whether the behavior has been caused by internal or external factors. Fundamentally underestimating the influence of the external and overestimating the influence of internal factors on the leader can affect the goals and objectives of the organization.

Attitude is a predisposition to respond positively or negatively to a person, idea, or event. Important to attitude is its correspondence to behavior and the subsequent responses produced. Evaluation of other individuals, ideas, events, or concepts are not done in isolation but rather are prejudiced by experience. This correlation between attitude and behavior is increased when stemming from personal familiarity. Attitude affects personal involvement, personal degree of satisfaction, and enthusiasm. Individuals who value personal self-worth having positive self-images and core self-evaluations reflect attitudes of satisfaction in their work. Individuals not possessing this are more likely to resign from difficult tasks and are less motivated.

Conflict can also be a product of perception. If an individual believes that another individual is/has (or is going to) negatively or adversely affect something that they place value on, this is called conflict. Traditionally conflict was viewed as dysfunctional, resulting from poor or minimal communication and a lack of trust between individuals. Conflict when discussed was traditionally categorized as violent, destructive, or irrational. Albeit that not all conflicts are good, conflict can be healthy. When conflict is addressed constructively the outcome can increase productivity, support leadership, and build teams. Authentic leaders recognize that conflict is a valid part of team formation. Team conflict can relate to tasks, work responsibility, and goals. Team conflict can produce greater creativity as new concepts are introduced. Personal conflict usually focuses on the dynamics of interpersonal relationships. Conflict runs the gamut of minor disagreements to overt and covert tactics to destroy individuals. However, conflict can be managed. Some ways leaders lead conflict are through organizational restructuring, attempting to act as a "devil's advocate," leading conversations on the conflictual issues/event, and the use of formal authority to communicate ideas or changes. Managers involved with conflict should clearly underscore all interests in resolving conflicts. For teams' conflicts, most disturbing and unsettling are those issues and events that remain unaddressed directly. The ambiguity caused can lead to a breakdown of communication, malcontent, and dissatisfaction on the team. Conflict resolution includes problem solving, compromise, altering work environments, expanding resources, and reexamining and redesigning goals.

## Motivation

Intensity, direction, and persistence of effort are all physiognomies of motivation and attaining predetermined goals. Intensity (how hard one is willing to go to fulfill a need) can be conflictual to

the individual. Direction examines the benefits to the individual or organization, and persistence measures the length of time (endurance) an individual will exert to attain their goal or perceived outcome. Maslow's hierarchy of needs outlines motivational needs. Fundamental needs are shown at the bottom of the pyramid and account for the individual's basic necessities. As you progress higher in the hierarchy more involved desires are shown Fig. 1.

Psychologist David McClelland's need theory differed from Maslow addressing specifically the need for achievement, power, and affiliation. McClelland's theory contends that there is a drive to excel and succeed and to make people act in ways they would not ordinarily behave and a need to be accepted, approved, and have affection.

In personality both theories are essential as they examine the underlying needs of personal motivation affecting the individual's behavior. Growth, advancement, responsibility, recognition, and achievement are all contributing factors to motivation and satisfaction. Policy and administration, supervision, poor work conditions, and diminutive salaries all contribute to dissatisfaction and poor performance. It has also been discovered that anything that does not surprise the individual does not motivate them.

As specific goals are met motivation produces intrinsic and extrinsic rewards. Directing team members in setting goals is a part of leadership as all behavior is goal directed. Feedback on performance (performance appraisals) increases productivity and leads to rewards, and (in most instances) produces mastery. Merit-based pay, bonuses, profit sharing, gain sharing, and employee stock ownership are incentives now used as performance rewards.

## Social Cognitive Theory

Emphasizing observational learning (*as the individual actively observes the actions and behavior of others*) social cognitive theory is inherently mirroring the actions observed. Enactive mastery pushes the individual to face difficult tasks as tasks to be mastered and not avoided. Vicarious modeling along with verbal persuasion (talking to ones' self) teaches the individual that continuous practice provides ongoing confidence. Arousal in social cognitive theory is the physical and mental stimulation of the individual through food or beverage such as caffeine, malted or peppermint or carbohydrates (lack of acute mental dysfunctionality). All add to motivation producing both mental and physical responses. Equity theory is another component of motivation as the individual compares his or her self to others while determining fairness or unfairness. Inequity can be perceived if the individual feels themselves under rewarded or inequity because they are over rewarded. Perception of equity is partly based on equity referent groups such as gender, tenure, organizational level, professional rank, and education. These groups each produce their own concept of equity. Perceptions of this nature hamper results impacting personality and leadership authority.

**Personality and Leadership, Fig. 1** Maslow's hierarchy of needs

## Group Behavior

Social identity is important to personality and leadership. Similarity, distinctiveness, status, and uncertainty reduction are some of the characteristics of social identity. As self-esteem is entwined with the performance of the group individuals have emotionally intense responses to failure or success. Group formation is not formed easily or speedily but is essential to group effectiveness. Stages of group development are pregroup, forming (little agreement), storming (increased conflict), norming (agreement and consensus), performing (clear vision and purpose), and adjourning (task completion). Groups formed with a positive social outlook reach "performing" more quickly. Groups with little to no sense of purpose experience failing or worsening performance throughout the project. Groups with robust purpose and strategy improve over time and increase performance. Managing groups and the complex personalities within groups is a complicated task for any leader. Leaders must be able to establish role properties (role identity, perception, expectations, and conflict). Delineating and addressing how each role property will be established and maintains allows the group to function as a unit and not as individuals working on their own tasks. Role norms (performance, appearance, social arrangement, and resource allocation norms) establish expectations and normalcies to avoid role discrepancy.

Deviant norms can sabotage and disrupt teams resulting in a lack of performance and group productivity. Deviant norms include such behaviors as leaving early, intentionally working slow, stealing from the organization or coworkers, showing favoritism, gossiping, sexual harassment, and verbal abuse. These behaviors undermine leadership and increase in a group setting versus the individual alone.

Status can be derived in the group through power wielded over others, an individual's ability to control or contribute to the group's goals and an individual's characteristics. When an individual is regarded as having "high status" they are treated with different preferences and considerations. Status and group interaction is influenced and stems from perception. Cultural differences can also influence the perception of status in differing measures. Group sizes also affect group behavior. Smaller groups are faster at completing tasks than larger groups. Large groups host input and solve problems better. However, smaller groups manage utilizing input better than larger groups.

Groupthink is related to norms and describes occurrences when the group pressures conformity deterring the group from critically reviewing odd, unpopular, or minority viewpoints. Groupthink can be subversive producing ostracizing, bullying, and an unhealthy work environment. In some instances, groupthink can also give rise to rejection and insecurity. Leaders can use groupthink to be productive through *groupshift* (discussing a given set of alternatives to arrive at a solution). Effectiveness of the group is predicated on the personality and skill of the leader to give context, composition, and process to the group. Leaders must be able to clearly identify resources, team ability, and common purpose for the group to remain effective.

Leadership is not always formal influence. Nonsanctioned leadership can be as important or more important than formal influence. Leadership influences a group towards a particular idea, thought, or concept. Optimal effectiveness is reached through management that is firm. Leaders challenge status quo, establish futuristic visions, and inspire others to attain their goals. Personality, social, physical, and intellectual attributes define the leader and differentiate them from managers. Effective leadership is indicated through emotional intelligence (ei). Leaders must possess a high degree of emotional maturity to lead successfully. Leadership can best be determined through the leaders' ability to construct, sustain and guide their teams. Leadership also is defined through duplication. If a team cannot function in the absence of the leader, it is not successful. Leaders should create and mentor other leaders. Some characteristics of leaders should include integrity, honesty, and decisiveness. Integrity defines trust and trustworthy. Leaders should be able to reach quick decisions with competence. Leaders are both dynamic and charismatic. Efficiency and persistency are also sought after characteristics of a leader.

Team performance affects leadership. Teams respond to the behavior and actions of the leader. Leaders must be able to "read" subtle cues and nonverbal communication and knowingly respond with empathy, sympathy, or commiseration. Absent the most suitable response leaders can effectively disorient his or her team.

Although personality, personality instruments, behavioral assessments, and simulations have been used to predict "leaders" with some degree of proficiency, leaders are not always easily identifiable. The personality profile of Indira Gandhi prior to her becoming Prime Minister of India failed to predict her leadership style and identified her as reticent. Often perceived as introverted, timid, or aloof, as Prime Minister she was ambitious, aggressive, forceful, and insistent. Leadership models are not exact sciences as each leader inherently is affected by their own personality and the personality of the people that they are leading. It is mutually agreed upon that failure and mistakes are primary building blocks for successful leadership. Involved leaders learn from their mistakes (and the mistakes of others).

## Power and Influence

Power is the capacity to influence another person. It is the ability to get person A to get person B to do something they would not have normally done had person A not intervened. Using influence person A affects the thoughts, behavior, and feelings of another person. Authority is the right to influence another person. Power and Influence can be exercised in all hierarchal directions and usually operates outside ones' job description.

## Emotion and Mood

Although often used interchangeably, emotion and mood have varying meanings. Brief in duration, caused by specific events, emotions are accompanied by distinctive facial expressions, specific in nature and quite numerous. Moods are more general in nature and not usually accompanied by distinct facial expressions. Emotions and moods are broad ranges of feelings experienced by the individual. The six most basic emotions are anger, fear, sadness, happiness, disgust, and surprise. Personality can affect emotions and moods and the level of intensity by which they are experienced. One common pattern surrounding emotion and mood is the end of the week being happiest for most individuals. Moods are affected by the day and time of the week. Moods can also be hampered by the weather, the season, stress, social activity, lack of sleep, and eating habits. Music and exercise have both been proved to improve mood and increase mental response (especially in depressed individuals). As age increases, fewer negative moods and emotions are produced. Sex affects mood; females have lengthier moods than males and experience emotions more deeply. However, this is believed to be a product of socialization rather than by gender.

Emotional episodes are a result of a series of emotional experiences prompted by a single event. Past experiences and emotions affect personal satisfaction and can impact personal relationships and job performance. Emotions (negative and positive) affect performance and are distractions and interruptions.

Emotional intelligence is the individual's competence to be fully self-aware, recognize emotions (negative and positive) in others, and respond to these indications as positively as possible. Emotional intelligence indicates levels of conscientiousness, emotional stability, and understanding emotions in self and others. Emotional maturity supports emotion regulation as the individual identifies, modifies, and "regulates" the emotions felt. Leaders engage in this for themselves and teams. Thinking positively, expressing complimentary thoughts (to oneself and the team), reappraising the situation, and engaging in relaxation techniques redirects thinking and introduces positive outcomes. Leaders employ strategies of this nature to direct focus and maintain control. Emotions influence negotiations, acceptance of leaders, service quality, and attitudes.

## Conclusion

Leaders are charismatic individuals exuding power, confidence, and ease. Often viewed as "hero" or "divine help," Leaders are role models and people of influence. Energy and enthusiasm cannot be separated from impactful leaders as they lead, manage, and build their teams. Effective communicators and articulate, their personality supports their roles. For the individuals on their teams (and those who are not), these highly gifted and talented people are respected and held in high esteem. Leaders are also transactional and transformational, outlining resources for productivity, initiating structure, and challenging process. Leaders are needed to challenge typical and customary conditions. Authentic leaders establish trust and impact followers thinking. Further to this, they produce other leaders and enable followers to think and explore ideas for themselves. Risk takers, leaders use their personality to increase effectivity and productivity in groups. Most importantly leaders teach others about vision, mentoring, and excellence.

# Phenomenon of Financial Contagion on the Crisis Framework, The

Souhir Amri Amamou and Sleheddine Hellara
Higher Institute of Management of Tunis, Tunis, Tunisia

## Synonyms

Contagion, Shock transmission

## Definition

Contagion remains a phenomenon not strictly defined. It is associated with shock transmission by direct contractual relations and therefore linked

to interdependency. Besides, indirect relations may explain the contagion phenomenon. Thus, they must be taken into consideration by market makers and public policymakers.

## Introduction

Although the subject of contagion is very much addressed by the research, since the Asian crisis in 1997, it becomes more topical following the sovereign crisis of the eurozone. It is in this spirit that this research deals with the theoretical evolution of the phenomenon of contagion in a more current crisis context.

It elucidates the theoretical complexity of detecting a precise definition of the contagion phenomenon that explains the multiplicity of currents presented by previous studies.

## The Noncontingent Theory

The noncontingent theory of crisis transmission is based on the notion of interdependence. The latter is defined by Ayadi et al. (2006) as the phenomenon generated by direct links producing a deterioration in fundamentals between markets or between countries during the same period. They stress that this period must be stable.

This theory considers that the interdependence between countries or markets is the most appropriate explanation for the realization of transmission or even the unique explanation for the realization of such a phenomenon. It has been analyzed by a fairly developed current of studies, such as by Kaminsky et al. (2003), Dornbusch et al. (2000), Forbes and Rigobon (2002), and Billio and Pelizzon (2003).

This view of the shock spread shares the opinions of researchers. Some studies assign the name contagion to the phenomenon of shock transmission through interdependence effects or spillover effects. Thus, they consider it to be a typology of contagion.

In contrast, other studies such as those of Dornbusch et al. (2000), Dungey et al. (2005), Marcal et al. (2011), and Kalotychou et al. (2014) insist that transmission shock and contagion are two well-differentiated phenomena.

From this perspective, the notion of interdependence analyzed by a large number of studies considers the transmission of shocks linked to the existence of a continuous (fundamental) relationship between markets or countries. They insist that a crisis effect does not change this relationship.

As for the nature of the latter, Glick and Rose (1999) and Corsetti et al. (2005) focus on the induced transmission of commercial interdependence relationships between markets or countries. Otherwise, Allen and Gale (2000) and Kaminsky et al. (2003) focus their research on the contribution of financial interdependence relationships to achieving shock transmission.

Whatever the nature of the relationship, Constancio (2012) considers that when two markets exhibit a high degree of joint movements during a stable period and these movements do not increase following a shock, it is transmission by spillover effects but not contagion.

Ayadi et al. (2006) insist that the analysis of changes between the fundamentals of two markets or countries must be in a stable framework. They consider that the stability of the framework is necessary to speak of transmission by interdependence.

In this regard, Forbes and Rigobon (2002) add that in this case, it is a case of transmission linked to a variation in volatility caused by spillover effects that are not contingent but with similar effects, hence the complexity of distinguishing between the two phenomena.

## The Contingent Theory

This theory emphasizes the durability of shocks transmitted between markets or countries. It considers that the realization of contagion is not only likely to cause temporal effects. In this perspective, Ayadi et al. (2006) state that the impact of this phenomenon can last for a long time and that markets find it difficult to get rid of it.

Besides, Cronin et al. (2016) add that contagion plays a limited role in the propagation of

shocks that only amplify in times of high volatility (crisis). Also, it can generate chain faults, especially for compartmentalized markets, which are very vulnerable to default. Thus, a closed relation between markets or countries may well be a source of contagion.

For example, Dieckmann and Plank (2012) find that risk transfer is more disastrous for countries belonging to the European monetary union. The latter is more sensitive to the health of the financial system than other countries. They are the most susceptible to contagion.

As for the market or source of contagion, Broto and Pérez-Quiros (2015) indicate that it may well change during the period of crisis studied. Moreover, carrying out an analysis of the contagion process affecting the eurozone in the financial crisis, they find that following its official request for financial assistance in April 2010, Greece was considered responsible for the realization of contagion in the eurozone. However, this role was subsequently passed on to both Ireland and Portugal following their requests for financial assistance in November 2010 and April 2011.

For the majority of previous studies, contagion is initially presented by direct contractual relations and therefore linked to interdependence. Ballester et al. (2016) attribute the term systemic contagion to this type of contagion. In this case, we talk about contagion through fundamentals. Thus, the failure of one part can be favored by both the contractual relationship between parties and circumstance of crisis or shock.

These present direct contagion channels are often characterized as being an explicative source of contagion analysis in the risky debt market. However, according to Fourie and Botha (2015), this can't be a unique explanation for the occurrence of this phenomenon.

At the same time, Brunnermeier et al. (2013) add that taking into account direct contagion channels leads to underestimating the risk on the market. They conclude that the consideration of these channels should not be neglected. However, to consider them fully responsible for contagion is highly unlikely.

In this regard, an explanation proposed by Ayadi et al. (2006) considers that in a crisis framework, the relations between economies become nonlinear. In this case, taking into account the direct and linear permanent channels between these economies is far from sufficient. Thus, consideration of specific temporal channels was a necessity in this study setting.

These channels are linked to indirect exposures (such as information propagation mechanisms, concentration, and liquidity), the analysis of which is very important for better detection of the contagion process. Moreover, Fry et al. (2010) and Fry-Mckibbin and Hsiao (2015) measure the vulnerability of countries to a financial crisis and their sensitivities to contagion through specific channels.

For contagion can even be explained by the change in the transmission channels of shocks between markets. Thus, the emergence of new channels may well create disruptions not considered in advance by market participants and generate contagion. The latter is called by Ballester et al. (2016) idiosyncratic or specific contagion.

Note that contagion remains a phenomenon not strictly defined. Besides, Broto and Pérez-Quiros (2015) consider that the quantification of contagion depends on the definition adopted, hence the multiplicity of methods for evaluating this phenomenon proposed by the literature.

## Contagion Definitions

For the IMF, the notion of contagion effects presents the impact that economic measures taken in one country can have on another country because of trade and financial relations. They see interconnections as playing a crucial role in making contagion happen.

As for previous studies, a synthesis of the latter makes it possible to classify the definitions of the notion of contagion into four trends.

At first glance, the first line of definitions proposed by Constancio (2012) and Dungey et al. (2005) analyzes contagion as a unilateral cause and effect reaction. In this perspective, the effect begins on a market or a country, and we only witness a contagion following the observation of this effect on another market (or country) under

the condition of the existence of a dependency relationship or a partnership.

According to Dungey et al. (2005), contagion is the transmission of unanticipated local shocks to another market or country. Thus, the existence of interdependence between markets (or countries) is a fundamental condition for talking about contagion. This opinion is supported by Ballester et al. (2016).

This current adopts the broad version of the definitions of contagion proposed by the World Bank which considers that this type of contagion can occur regardless of the good or bad period and could not necessarily be linked to a crisis framework.

For the second stream, it analyzes contagion as a bilateral reaction affecting two markets (or countries) at the same time. This is the restrictive definition of the World Bank.

According to Baig and Goldfajn (2002), and Ballester et al. (2016), this phenomenon is generally characterized by a joint movement between returns on financial assets. Cronin et al. (2016) consider that this type is based on a joint co-reaction explained by the interdependence or partnerships between the two markets or countries.

In the majority of cases, this current of studies is based on a comparative opinion between two types of periods: periods with a low level of risk and others with a high level of market risk.

In the first type of period, the markets are stable and very promising. It is a period characterized as calm with good visibility of market threats. Note that during this period, the level of correlation between markets is acceptable and well explained by common dependency relationships between financial markets.

For the second period, correlation levels fluctuate much more than in quiet times. Coudert and Gex (2010) find at this level that we may well see dominance between markets in such periods.

The importance of studying this period is to detect any changement in correlation and typologies of relations between markets. These changes can be symptomatic of contagion. This result is referred to as a large body of work, notably those of Dornbusch et al. (2000), Bae et al. (2003), and Longstaff (2010).

For Forbes and Rigobon (2002), the increase in these joint movements between a stable phase and a crisis phase is a mandatory condition for the detection of contagion. Otherwise, these changes in relationships show only signs of interdependence.

The third stream of definitions considers the increase in relations between countries or interdependent markets favoring the emergence of new channels of transmission of shocks as a measure of contagion. The World Bank qualifies this definition as very restrictive based, unlike the broad version, on an observation of the differences in correlations according to the periods (calm or crisis).

In this case, the possibility of a joint co-reaction is well considered by market participants. Thus, the intensity of this reaction presents an indicator of contagion. This opinion is supported by Bekaert et al. (2014) who consider that contagion is a movement above forecasts. So, the principle of overreaction is a sign of the contagion phenomenon.

This conclusion is in agreement with the results of Anderson (2011). The latter uses the level of correlation between markets as a measure of the possibility of shock transmission. He points out that exceeding the usual level of correlation may cause an additional probability that a shock could be transmitted from one market to another or from one contract to another. Statistically, the excess correlation was applied to the correlation of the residuals of the factor model of Kallberg and Pasquariello (2008).

Finally, the last current considers transmission and joint movement as two possible aspects of contagion and possible definitions of this phenomenon. It characterizes contagion as the passage of an unexpected or less intense shock from one entity to another, from one contract to another, from one market to another, or even from one country to another. Only the phenomenon of shock or risk transmission is enough to consider the contagion phenomenon. Thus, the significant increase in relationships between entities, contracts, markets, or countries in times of stress as a crisis framework can well be defined as contagion. Besides, a change in the transmission channels may well trigger this phenomenon.

## Contagion and the Crisis Framework

The analysis of contagion has been the subject of several theoretical approaches that empirical confrontations have led to equivocal results.

On a practical level, Tabak et al. (2016) consider that the analysis of contagion can be a means for regulators and policymakers to review their policies and regulate their actions.

Besides, this line of research is gaining in importance with the multiplicity and convergence of crises affecting financial markets in recent years.

In this perspective, several studies such as by Amisano and Tristani (2012), Muratori (2015), and Caporin et al. (2015) analyze the importance of financial contagion in the context of a crisis (sovereign crisis framework). Both Hellwig (2009) and Forbes and Rigobon (2002) find that the period of crisis increases the possibilities of achieving contagion.

The same opinion is supported by who define contagion as the rise of a crisis probability in one market linked to the occurrence of a crisis in another market. It is explained by the increase in conditional volatility between markets. Likewise, Bekaert et al. (2005) find that they could evolve more together in the context of a crisis, which may reflect contagion.

Empirically, a study by Mollah and Zafirov (2014) covering a sample of 63 countries indicates that the symptoms of contagion mark 46 of them presented by the phenomenon of a significant increase in their correlations with the American market during the financial crisis (2007–2008) compared to previous quieter periods.

Moreover, this phenomenon is explained by Khalid and Rajaguru (2007) by the fact that the dependency relationships between financial markets follow an upward trend following a financial crisis.

These results are in agreement with the conclusions of Ballester et al. (2016). They find that financial institutions and even economies are becoming more and more interconnected, which may explain the interdependency between markets and shock transmission by contagion.

Note that the onset of a crisis is easily detectable by the occurrence of a critical event affecting the market and which may spread to other markets or countries. The problem lies in choosing a date on which we can declare the end of a crisis, especially since the crisis period is not necessarily linked to a single critical event that is the source of contagion. On the contrary, it may well present several ones at different times, hence the difficulty of analyzing this framework and the continuing interest of researchers in the analysis of this subject.

Likewise, the nature of the crisis necessarily affects those of the contagion, taking the example of the two most recent ones, namely, the financial crisis (2007–2008) and the sovereign crisis in the eurozone. Hsiao and Morley (2015) advocate that the sovereign debt crisis was more predictable than the financial crisis (2007–2008) which affects the nature of contagion during both frameworks.

The predictability of the sovereign crisis in the eurozone and the states' awareness of the risk incurred have encouraged countries to find means of regulating their precarious situations. This regulation took the form of a commitment by euro area countries to absorb their deficits at a faster pace (Boone et al. (2010)). However, the crisis broke out, demonstrating the inability of states (even the best rated: the case of France) to flee from expected contagion.

The high level of risk favored by this crisis was accompanied by a panic on the financial and money market, more particularly on the risky debt market. Moreover, even the debts that the markets offer as very low-risk debts (such as public bond debts) have seen a dramatic increase in levels of fears about them. Market makers did not stop at the discovery phase but tried to escape this delicate situation by seeking means of protection and cover. Their efforts were therefore directed to the credit derivatives market and particularly to the sovereign credit default swaps market (CDS), encouraging the revival of this market. Moreover, we note that this market is currently the second-largest CDS market competing with the private debt market.

Generally, contagion is a phenomenon linked to the shock and risk transfer in the markets, whereas CDS are products initially constructed with the objective of immunization against credit

risk. They allow an agent to get rid of his risk level by transferring it to another following a prior commitment.

The study of CDS as vectors of systemic contagion is linked to the analysis of the crisis framework. Moreover, a current of studies is based on the implied variance presenting the implied volatility related to CDS. They find it to be more informally efficient than those realized in the assessment of credit risk (Berndt et al. (2008) and Carr and Wu (2009)).

Cao et al. (2010) find that this variance is the best to explain the joint correlations of time series linked to CDS spreads. This result is supported by Pan and Singleton (2008) and Longstaff et al. (2011).

Note that the high volatility during the crisis systematically increases the levels of the coefficients and may err in the detection of contagion (Forbes and Rigobon (2002)). In this case, the consideration of the crisis effect was necessary since volatility presents a measure of fear and thus explains the credit risk (Che and Kapadia (2012)).

Referring to Bekaert et al. (2014), the phenomenon of contagion, of which protection via CDS was supposed to be the best remedy, was accentuated following the financial crisis (2007–2008). In this regard, Kim (2016) finds that this crisis highlights the risks associated with the CDS market.

Thus, the assessment of contagion becomes a priority leading to better pricing of CDS contracts. Moreover, this explains the interest in this subject by several researchers such as Kalotychou et al. (2014).

According to Kim (2016), the interconnection between this market and other markets, whether they are hedging, debt, or even an underlying asset, favors the possibility of shock transmission between this market and its partners. Empirically, these results are consolidated by D'Errico et al. (2017).

The crisis framework linked to the emergence of these products complicates the assessment of their contributions to the risky debt market. This complexity is explained by the fact that crisis framework is always associated with an additional risk favoring a change in market relations.

## Conclusion

Contagion remains a phenomenon not strictly defined. Despite the differences in definitions proposed by the literature, they converge on two notions, namely, change and interdependency. As for change, contagion is always associated with the observation of a new phenomenon. It can take the form of an unexpected shock in the market or even expected but in an unpredictable dimension.

For interdependency, this condition is necessary to speak of a contagion phenomenon but not sufficient to confirm its realization. It must be correlated to the emergence of new channels or a change in the relations between the markets to be able to pass from a noncontingent relationship of spillover effects to one likely to provoke a contingent transmission phenomenon.

Thus, contagion is associated with shock transmission by direct contractual relations and therefore linked to interdependency. Besides, indirect links can explain this phenomenon. Thereby, they must be taken into consideration by the market makers and public policymakers.

Note that the study framework is so important in the analysis of this phenomenon since a crisis framework stimulates its realization and can well explain the impact of this phenomenon on a market or a country. Moreover, this is the case with recent crises that even the public credit derivatives market presented by CDS has not been able to reduce the scale.

# Philanthropy and Nonprofit Organizations, Russia

Alexander Livshin
Moscow State University, School of Public Administration, Moscow, Russia

## Synonyms

Charitable giving; Charity; Endowment; Nonprofit organization; Nonprofit sector; Philanthropic foundation; Philanthropy; Russia; Social capital; Social services; Socially oriented NPO; Third sector; Volunteering

## Definition

### Nonprofit Organization

An organization for which profit is not the main goal of existence, and it meets the nondistribution criteria, i.e., such organizations do not distribute profits to benefit individual or collective owners. Nonprofit organizations are formed to achieve political, cultural, educational, religious, professional, and social service objectives.

### Philanthropy

Voluntary action for the public good, dedication of personal or corporate wealth, and skills for the benefit of specific public causes.

## Introduction: Philanthropy and Nonprofit Organizations: The Conceptual Background

The connection between philanthropy and nonprofit sector can be explained through the concept of social capital. The key idea of social capital is that social networks and social cohesiveness are no less important for a modern society, than human or financial capitals. Social capital has a dual significance: it's crucial for both the economic performance, especially in a modern economy, based on information and knowledge, and for the flourishing civil society, the basis of democracy. Different in nature from either human or financial capital, social capital builds trust, develops networks, and generates willingness to associate through creating participatory enthusiasm for public life and social involvement.

Social capital builds upon norms of reciprocity, mutual support, and solidarity that are most easily developed by participation in civic associations that usually exist in the form of nonprofit organizations. Therefore, the nonprofit sector can be seen as a product of social capital; at the same time, sustainable and viable civil society leads to the formation of social capital.

There are two main types of social capital. The first type might be characterized as a bridging (or inclusive) type, while the second one might be seen as a bonding (or exclusive) social capital. Bridging social capital is most important for a modern society's sustainable development because it brings together people from different social backgrounds, professions, and racial, ethnic, cultural, and religious groups. They all are getting involved in the process of creating common good.

The concept of social capital provides us with a modern understanding of philanthropy, which cannot be limited to viewing it as just a financial institution. The act of charitable giving is an important form of societal activity which, on the one hand, derives from social capital (people donate to whom they trust; they donate because they are socially involved and contribution can make impact; networks stimulate the willingness to donate), and on the other hand, it contributes to the formation of social capital and democracy.

Throughout the world, philanthropy is seen as an important means of strengthening democracy, developing civil society, and consolidating social capital. The development of social capital influences the level of philanthropic activity, and,

conversely, charity work increases the social capital and strengthens society.

A nonprofit organization (an organization registered according to legislation with a nonprofit status, NPO) derives from civil society and civic activism. Another term – a nongovernmental organization (NGO) – is usually used as synonym to NPO (emphasizing the fact that they are not government agencies); however it might also distinguish those nonprofits that do not perform government-like functions and do not receive a significant portion of their revenue from the state. A nonprofit status means that profit is not the main goal of the organization's existence, and it meets the nondistribution criteria, i.e., such organizations do not distribute profits to benefit individual or collective owners (this principle is often referred to as a nondistribution constraint). However, these organizations can and do earn profits. At the same time, such organizations can be defined as independent, private, and voluntary. Another important feature of nonprofit organizations is tax exemption or tax benefits they receive in exchange for directing revenues to serve their beneficiaries.

Being an organizational framework for civil society, nonprofit organizations are self-governing, non-compulsory bodies that accommodate diversity and give attention to minority needs, provide assistance and support, and engage in social innovation. Major areas of nonprofit activity are education, healthcare, social services, arts and culture, recreation, environment, human rights protection, advocacy, and religion.

A sum of nonprofit organizations in a society constitutes a nonprofit sector (third sector), with government and its agencies of public administration being the first and business and commerce being the second (sometimes households are also considered a sector). Many contemporary scholars emphasize the increasing blurring of boundaries between the sectors, which has led, among other important consequences, to the emergence of the social entrepreneurship concept. Organizations can "migrate" from one sector to another; there are multiple organizations that have both for-profit and nonprofit (for instance, social enterprises). Although they sometimes compete, the three sectors throughout the world are going through the process of rapidly growing interaction and cooperation.

According to modern theoretical approaches, the nonprofit sector performs different roles in different countries, socioeconomic and sociocultural settings. Those roles can be arranged according to few distinctive models (*Helmut Anheier. Nonprofit Organizations. Theory, Management, Policy. Second Edition. Routledge, NY. 2014. Pp. 218–220*):

***Liberal model*** – low government social welfare spending plus relatively large nonprofit sector which substitutes for the government (USA, UK).

***Social democratic model*** – nonprofit sector performs a function of advocacy and personal expression, rather than a service-providing role (Sweden, Denmark, Norway, Finland).

***Statist model*** – both government social welfare spending and nonprofit activity remain limited (Japan, most developing countries, Russia).

***Corporatist model*** – the state has been either forced or induced to make common cause with nonprofit institutions (France, Germany).

The third sector throughout the world performs two major groups of functions: (a) social service delivery and (b) civil society enhancement, human rights protection, civic engagement, and advocacy. The service component ranges from 42% of total NPO activities in Sweden (social democratic model) to 87% in Japan (statist model).

## Russian Civil Society and Philanthropy: History

Russia, despite many stereotypical perceptions of its past and present, has deeply rooted historical traditions of self-governance and civil society. To some extent, these roots can be traced back to the role of rural commune and communal life throughout many centuries of Russian history. Rural commune has been a self-governing institution which role in regulating everyday life of the

majority of the Russian population has considerably outweighed the role of any other institution including that of the state. In the early centuries of its statehood, many Russian cities were governed, along with local princes, by a *veche* – gatherings of free citizens which have been making decisions on many issues of local politics. In Novgorod, an important commercial center in the northwest of Russia, *veche* has evolved into a crucial institution which has transformed local political system into what can be roughly defined as a medieval democracy. There was no local dynasty ruling in Novgorod, and before this city became finally subordinate to Moscow in the late fifteenth century, princes were invited and easily expelled from the city by the *veche*.

In the new times, Russian civil society began emerging with the reforms of Peter the Great and especially during the period of enlightenment, or *enlightened absolutism*, which was associated with the reign of Catherine the Great in the second half of the eighteenth century. In 1762 and 1785, she relieved Russian nobility from mandatory service to the state which paved the way to the emergence of *intelligentsia* – an independently thinking and critical part of the society. In 1765, the first civil society self-governing organization – Free Economic Society – was created. It was established by Catherine the Great to study economic life in Russia and to disseminate knowledge about best practices in the economy. However, autocracy and serfdom have been formidable obstacles for the development of institutions autonomous from the government. Civil society in prerevolutionary Russia reached its peak much later, in late nineteenth to early twentieth centuries, after the abolition of serfdom in 1861 and a series of constitutional reforms during and after the first Russian revolution of 1905–1907. The "Great Reforms" of the 1860–1870s gave birth to *zemstvos* – a new type of elected municipal bodies in rural areas as well as self-governing institutions in cities. In 1905 and following years, dozens of political parties have emerged. In 1917, from February, when autocracy was finally overthrown by a new revolution, to October, when *Bolsheviks* seized power, the country has experienced powerful civil activity with hundreds of civil society organizations emerging. The communist revolution led to the end of civil society which was completely crushed by the state. The rebirth of civil society began during the years of *perestroika* in the late 1980s and continues with its ups and downs until now.

Charity and philanthropy in Russia also have a rich prerevolutionary past, followed by a period of Soviet-era suppression. Charitable giving was profoundly rooted in the pre-communist Russian history and has a deep grounding in the Russian thought. Charity in Russia historically has been influenced by religion and religious tradition. For many centuries, the Orthodox Church and monasteries were the main focus of social assistance for poor and sick people. In medieval Russia, helping the poor was a matter of particular individuals, a spontaneous act of kindness from person to person outside formal organizations, and an open display of mercy and compassion. Unconditional sharing – compassionate benevolence and generosity – has been seen by the Church and by the populace as a sacred act. Charity has become such an important part of Russian culture that it is even evident in the language. It was customary to address one's superior as *milostivyi gosudar* (merciful/chartable sire), *otets-kormilets* (father-benefactor), zastupnik (protector), or *milosrdni pokrovitel* (merciful patron) (*Natalia Dinello. Elites and Philanthropy in Russia. International Journal of Politics, Culture, and Society. September1998. Vol. 12. Pp. 109–133*).

By the 1763 decree of Empress Catherine the Great, first philanthropic organizations were created in Moscow (1764) and Saint Petersburg (1772). Russian Empress Maria Feodorovna, the second wife of Emperor Paul I, was called the "minister of charity." Emperor Alexander I established the Imperial Philanthropic Society in 1816. His main goal was to satisfy the needs of the poor. Following this example, other organizations and societies were getting established. First "sisters of mercy" society was founded in 1844 and played a major role during the Crimean War. Regardless of the age, rank, or education, Russian women were self-sacrificingly serving in hospitals, practicing charity.

From the second half of the nineteenth century, the development of "charity of *zemstvos* (new municipalities)" has started. By the end of the century, Russian district councils have been spending about three million rubles per year for helping homeless and displaced people. In the post-reform Russia, many laws were passed, and different unwritten rules were established. Social policy of the state and public and private charity acquired features of a comprehensive system and thus received a powerful impetus to development.

The imperial family supervised the exercise of philanthropy, itself making generous contributions to the society to lead by example. By the mid-nineteenth century, Russian industrialists, financiers, and merchants started participating in philanthropic activity, supporting fine arts and literature. At the turn of the nineteenth century, there were as many as 3500 charitable institutions in Russia. The wealthy members of the community of "Old Believers" were especially active in charitable giving (Morozov, Prokhorov, and Ryabushinsky families, etc.). By the end of the nineteenth century, philanthropy in Russia became such a large-scale social phenomenon that in 1892 a special commission was set up in authority of which were legal, financial, and property aspects of charity. The most important outcome of the work of that commission was ensuring of transparency of charitable activities in Russia, openness, and availability of all information, including financial aspect for all stratums of society. Since the end of the nineteenth century, public control over charity was established, which resulted in growing trust for the activities of philanthropists and, as a consequence, new unprecedented growth in the number of donors.

The most famous Russian patrons were entrepreneurs Savva Morozov and Pavel Tretyakov. With the financial support of Morozov, the Moscow Art Theatre was created in 1898. Tretyakov was purchasing paintings by Russian artists and had such authority in cultural environment that each new purchase was seen as an act of public recognition. In the end of the nineteenth century, the famous Tretyakov Gallery was established.

In 1905, 11,040 charities were functioning in the Russian Empire. Charitable organizations rendered assistance to adults and children by providing low-cost free education (schools, workshops, and classes), accommodation (rooming house, night quarters, apartments, and dormitories), food (canteens and soup kitchens), employment (workhouses, handmade craft), and medical care (hospitals, dispensaries, medical centers).

The October Revolution of 1917 denounced philanthropy and destroyed a complex charity system, replacing it with a unified network of state institutions. Assets of public and private charities were nationalized, and the property was transferred to the state. The resolution of All-Russian Central Executive Committee and Council of People's Commissars of the RSFSR of 8 April 1929 "about religious associations" introduced a ban on all organized charitable activities of religious organizations. The communist government seized complete control of all issues of social welfare and social assistance to citizens. The government introduced a ban on all self-organized charitable activities at all levels, including those of the Russian Orthodox Church.

Only since the end of the 1980s, political and socioeconomic conditions for the revival of forgotten traditions of charity and philanthropy began to form in Russia. However, a massive, independent, nonprofit philanthropic sector emerged only in the 1990s, after the collapse of the USSR and the beginning of transition to a market economy.

## Nonprofit Sector in Contemporary Russia: Legislation and Policies

Major legislation which regulates nonprofit sector and philanthropy was adopted in the 1990s, after Russia began transforming its political and socioeconomic systems. Among most important pieces of legislation are:

- Civil Code of the Russian Federation (1994–2006)
- Federal Law of 12.01.1996 # 7 (last amended 23.05.2016) "On Nonprofit Organizations"
- Federal Law of 19.05.1995 # 82 "On Public Associations"

- Federal Law of 01.08.1995 # 135 "On Charitable Activity and Philanthropic Organizations"
- Federal Law of 12.01.1996 # 10 "On Professional (Trade) Unions, Their Rights and Guarantees to Them"
- Federal Law of 11.07.2001 # 95 "On Political Parties"
- Federal Law of 20.07.2012 # 121 (amending the law of 1996, introducing controversial "foreign agent" status for foreign-funded NGOs)

Since the transition from communist regime had begun, much attention has been paid to the creation of the nonprofit sector, to its regulation, to issues of securing governmental and private support to the sector, and to the ways of improving its sustainability. Much has been done in the areas of funding, outsourcing, procurement, etc. Since the early 1990s, different contradictory policy initiatives have been implemented. The results of these initiatives are ambivalent: on the one hand, the nonprofit sector is getting more mature, innovative, and competitive. Since 2009–2010, the state has been consistently building the infrastructure of governmental financial and organizational support for what was defined as "socially oriented NPOs." Much has been achieved in terms of improving the institutional framework of government-civil society interactions: such important institutions as Presidential Council on Civil Society Development and Human Rights, Public Chamber of the Russian Federation, Public Chambers in the provinces, Public Councils at municipal level, and Public Councils at governmental executive bodies (52 in 2012) have emerged.

On the other hand, the regulatory burden on nonprofits has been permanently growing. The state has imposed much stricter rules of registration and reporting, which complicated the life of many organizations. Aiming at establishing more control and supervision, the government adopted a new legislation leading to labeling NGOs as "foreign agents" in case they receive funding from abroad. Policies toward NGOs have been designed in the way that would discourage them from participating in political process and encourage their focus on social issues and social work.

There has been a lot of discussion in the Russian society about the ways of creating a more stimulating legal and political environment with regard to nonprofits. The Third All-Russia Civil Forum – a large congress of civil activists and nonprofit leaders which occurred in 2015 – proposed substantial policy changes. They include:

- Relieving registration procedures
- Continuing and expanding the program of supporting socially oriented NPOs by the state
- Relieving strict regulation, leading to labeling NGOs as "foreign agents." In order to do so – to abandon a very broad definition of "political activity" by which any kind of activity could be labeled as "political"
- Expanding the scope of social services which is outsourced to nonprofits and funded from state/municipal budgets at all levels
- Enforcing the principles of non-discrimination of civil society organizations when it comes to social services delivery – to create legislation that would prevent complete state monopoly on social services delivery
- Granting nonprofits access to the support infrastructure, created for small businesses
- Establishing a more comprehensive system of tax deductions for philanthropic donors, for instance, on donations made from dividends
- Exempting from taxation revenues philanthropic organizations receive from business activities if those revenues are spent on social programs
- Increasing the participation of civil society organizations in conflict mediation and conflict resolution, to allow NGOs create officially acknowledged negotiation platforms
- Creating a nonprofit sector association/lobbying organization, officially acknowledged by the government as representative of the sector in negotiations with the state

## Russian Nonprofit Sector: Main Characteristics

Over the past two decades, Russia has developed a third sector of considerable size and nearly

227,000 NGOs officially registered (May 2016). Over one million people work at NGOs which perform social/human services. However, most Russian nonprofits are small: 70% of Russian NGOs have five people or less of paid staff, whereas just 2% have over 50 employees. About 43% of nonprofits attract only five or even less external (supernumerary) experts/workers. About 53% of NGOs in Russia operate on the basis of funds provided by members and are very limited in terms of funding and financial sustainability.

After the Federal Law # 40 of 2010 "On Introducing Amendments Into Some Legal Acts Regarding the Support for Socially-Oriented NPOs" was adopted, due to the strengthening of financial support, the number of nonprofits has increased over the 2-year period (2011–2013) by 16.5%; the average number of volunteers is by 36% (according to data provided by the Russian Ministry of Economic Development). As a result, in 2014, 23 million people received social services from socially oriented NGOs. Five million people received legal support/consulting either free of charge or at subsidized price; over three million people received financial support (in cash) from socially oriented NGOs.

Since it was created from scratch, the nonprofit sector in Russia is still small by international standards in terms of its contribution to the national economy. According to different sources, its share in GDP is equal to 1–2% (average in the developed world – 6.5%). With 1% of the total workforce, it can hardly compare with 7.1% average level of the developed nations.

One of the biggest problems the third sector is facing is the lack of information and knowledge that Russian citizens have about the role of nonprofits in the economy and in social work. There is a very obvious lack of coverage of the role on the third sector in the media. According to recent polls, although the term "nonprofit organization" is familiar to 54% of respondents, only 16% are well informed about NGOs and their role. About 33% know nothing about nonprofit activities in the place where they live, while 27% believe that NGOs are used by foreign intelligence services.

The lack of knowledge results in low credibility people give to Russian nonprofit organizations, even those involved in charitable activi-ties. Recent surveys indicate that only 44% of respondents express some level of trust toward philanthropic NGOs; 43% either not trust at all or more likely do not trust them.

## Socially Oriented NGOs: Governmental Support

The special status of a socially oriented NPO (SO NPO) was introduced in 2010 in order to develop the lacking system of financial and infrastructural support by the state. Russia is lagging far behind the developed nations in terms of both the volume and quality of government support programs, as well as tax benefits to nonprofits. If an organization performs the functions listed below, it is entitled to apply for the SO NPO status:

1. Protection and social support for citizens
2. Overcoming the consequences of natural disasters and ecological, technogenic, and other catastrophes
3. Providing assistance to victims of natural disasters; ecological, technogenic, and other catastrophes; and social, ethnic, and religious conflicts to refugees and migrants
4. Environmental protection and animal welfare
5. Protecting territories of historical, religious, cultural, or environmental significance and burial places
6. Provision of legal aid to citizens and nonprofit organizations, legal education, and efforts to protect the rights and freedoms of citizens
7. Prevention of socially dangerous forms of behavior
8. Charitable activities and activities to promote philanthropy and volunteerism
9. Activities in the fields of education, science, culture, art, and healthcare, prevention and health protection, promotion of healthy lifestyles, improving the morale of citizens, physical culture and sport, and assisting the "spiritual development of an individual"
10. Other activities established by federal laws and laws of subjects of the Russian Federation

Since 2010, the state has been gradually developing a system of supporting SO NPOs. The policies already adopted include financial, property, information, and consulting support. They also include support in the field of training, retraining, and advanced training of employees and volunteers of nonprofit organizations. Some steps have been taken in order to provide tax benefits for socially oriented NPOs. New taxation policies also include tax benefits to individual donors: social tax deduction equal to the amount of donations, but not more than 25% of the income earned was introduced. Social advertising became exempt of VAT.

The functions of building the infrastructure of government support for socially oriented NPOs were assigned to the Russian Ministry of Economic Development. The Ministry has been offering two types of subsidies: (1) subsidies to support regional nonprofits in Russian provinces and (2) subsidies given directly to NPOs to disseminate best practices and for consultancy services rendered to other NPOs. Subsidies to Russian provinces account to two-thirds of the entire amount of funds allocated for government support. They are being distributed among the regions on a competitive basis. Provinces distribute those funds among specific NPOs also on competitive basis in the form of grants. The Ministry of Economic Development has developed conditions for supporting regional programs of social nonprofit sector development. These conditions include federal and regional budgets cost-sharing as well as the existence of officially adopted and approved by local legislature procedures of competitive grant-giving to SO NPOs. Criteria for supporting regional programs from the federal budget include the existence and efficiency of a working mechanism of outsourcing social services to nonprofits through (a) budget subsidies and (b) procurement. The existence of regional tax deductions for SO NPOs as well as for donors is also an important criterion. For this reason, the right of Russian provinces to establish tax benefits was established. Regions can provide benefits or even nullify property tax or transport tax for legal entities. Benefits can be given both to nonprofit organizations and to companies donating to them. Public-nonprofit partnerships in Russian provinces, especially in the form of subsidized rentals of public property, are also taken into account, along with regional governmental programs of informational support through local media and social advertising. Another important move was developing such criteria as having representatives of social nonprofits participating in advisory boards of regional governmental bodies.

Starting in 2015, a new type of NPOs has been established – a "Social Service Provider." In 2015, the status was granted to 150 socially oriented nonprofits. They are entitled to more benefits in terms of procurement and outsourcing.

A large role in SO NPO funding is played by "Presidential Grants" program. Grants are given to NGOs which "participate in civil society institutions development" and "implement socially significant projects."

## Contemporary Russian Philanthropy: From Traditional to Strategic Giving

Currently 58% of the Russian population is involved in charitable giving of different kinds, and this share steadily grows (48% in 2009 – 27th among 69 countries surveyed). Comparing Russia to some other countries, in the USA 89% of households participate in charitable giving, whereas in Germany only one-third of all taxpayers (nine million people). What makes Russia very distinct is the correlation between corporate and individual giving: Russia is the land of corporate philanthropy, whereas individual giving is lagging far behind. In Russia, corporate-individual philanthropic giving ratio is 15:1. By comparison, in the USA 73% of all donations come from individuals, 5% from corporations, and the rest from foundations and bequests. In terms of philanthropic activity, there is a great variation among Russian regions. It ranges from 30 to 62% of individual donors among the population, depending on a region/province. Tambov province in south-central Russia is at the top of the list – over 66% of the adult population has donated to philanthropic foundations (and even a bigger percentage to other types of recipients).

However, in general, Moscow and Saint Petersburg prevail heavily over other regions

since they have a fairly sophisticated infrastructure for philanthropic activity. About 15% of the Russian population are "serial donors" – they make donations frequently.

Philanthropic foundations sector in Russia performs a distinctive role in the society, being a major institution of delivering private and corporate funds and other resources to numerous constituencies of beneficiaries. In 2014, Russia had 8816 foundations (USA, 75,000 foundations; Germany, 13,000; UK, 9000; Spain, 10,000; Italy, 5000).

There is a huge concentration on the foundations market: 485 largest foundations are raised almost 10.5 billion rubles in 2014, whereas 3% of them raised 63% of the entire amount of funds risen. In terms of geography, there is a disproportionate concentration as well: a vast majority of large foundations are Moscow-based (of 14 largest, 12 are in Moscow, 1 in Saint Petersburg, 1 in Yekaterinburg). There are five types of foundations in Russia:

- ***Private foundations (49% of all foundations)*** – individual or family foundations; NPOs created via a single primary donation from an individual. Their funds and programs are managed by their own trustees or directors: usually they do not solicit funds from the public.
- ***Corporate foundations (23%)*** – established by business companies to run their philanthropic programs.
- ***Local communities' foundations (1%)*** – created within a regional entity and designed to accumulate funds from local businesses and private donors.
- ***Fundraising foundations (21%)*** – created to raise funds from multiple individual and corporate donors in order to serve the needs of a specific group of beneficiaries.
- ***Endowments (6%)*** – created to accumulate funds for business investments; tax-exempt revenues are used for philanthropic purposes and for supporting nonprofit programs.

In terms of areas supported by philanthropic foundations, an obvious shift from traditional assistance to people afflicted by poverty or disease to a more strategic approach of making social investments into areas that create healthier and more sustainable societies is taking place. The proportion of foundations that support different areas of their total number are:

Education – 82% of all foundations
Support for socially vulnerable groups – 55%
Support for nonprofit sector – 51%
Health – 51%
Science and research – 49%
Art and culture – 47%
Sports, fitness, and healthy lifestyles – 45%
Child protection – 32%
Local communities' development – 30%
Civil society development initiatives – 23%
Environment protection – 20%
Economic development – 18%
Religious life – 16%

Fundraising foundations support mostly health, endowments – education and corporate and private foundations – and social services for vulnerable groups. Local communities' foundations split their funds in more or less equal shares; there are no dominant priorities among them.

## Conclusion

Russia, like other transitional countries, strives to get rid of the communist regime legacy and of all sociocultural and societal deformities this regime had caused. Since the transition to a market economy had started, the Russian nonprofit sector has evolved into a prominent force which provides the organizational infrastructure for civil society and manifests the economic capacity of civic participation. NGOs create a strong foundation for social welfare, civic engagement, philanthropic giving, and volunteering. This is a crucial factor in a transitional society, where people are alienated, atomized, and tending to focus on their individual success rather than on social issues and the needs of their communities. However, NGOs are still being discriminated as compared to state and municipal bodies, delivering social services; they are deprived of many benefits with regard to taxation, property lease, etc. They are discouraged

from getting involved with politics, but the state stimulates those nonprofits that do social work. Philanthropic foundations are the most important element of the Russian nonprofit landscape.

# Philippine Public Administration: 5Es and an A

Alex B. Brillantes[1] and Maria Pilar Lorenzo[2]

## Synonyms

Expansion of classic framework of Public Administration; Government principles; Philippine Public Administration

## Definition

5 Es and an A is a conceptual framework that seeks to expand the classic framework of Public Administration given the context of a developing country like the Philippines that grapples with well-entrenched issues of inequality, lack of inclusive growth, nepotism, and corruption.

## Introduction

The discipline of Public Administration has many times been considered a sub-field of the general field of management and administration, and thus, tends to focus on the three general classic concerns of economic, efficiency, and effectiveness, also referred to as the 3 Es of Public Administration. However, given the context of the Philippines, a developing country that has been confronted with deeply rooted issues on inequalities, lack of inclusive growth, nepotism, and corruption, Public Administration has always gone beyond the traditional 3Es – and it is not unreasonable to assume that this may be also true for other contexts – as other, and perhaps more relevant, principles have to undergird the theoretical underpinnings and practice of the discipline.

## Defining Public Administration

Many countries today continue to grapple with the challenges of growing inequality and graft and corruption that have hindered growth and development. Conventional thinking has always related these to the unresponsive – and underdeveloped – administrative structures and procedures, sometimes referred to as "maladministration" (Caiden 1991:486). Certainly, good administration boils down to the so-called 3Es of management, economy, efficiency, and effectiveness, which are all undeniably critical. But equally important are the principles of equity, ethics, and accountability wherein the lack of these in practice also lead to maladministration and have also been characterized as "bureaupathologies" that are "systemic shortcomings of organizations that cause

individuals within them to be guilty of malpractice" (Caiden 1991, p. 490).

## Traditional Public Administration: Classic Principles of 3Es

The emergence of the discipline of Public Administration as a distinct area of academic study can be specifically traced to the seminal work of Woodrow Wilson entitled "The Study of Public Administration" (1887) published during the peak of the Progressive Movement in the United States in which Wilson called for a rigorous scientific study of administration (Waldo 1953). In an expanded text version of his speech entitled "The Study of Administration," he refers administration to the practical functioning and operating of the government and advocates for the study of public administration as a science, arguing that it needs to be a self-conscious discipline. Wilson has thus ushered in what is called in the discipline as the politics-administration dichotomy, which signifies the study of public administration as a science of management distinct and separate from politics. Wilson's tenets mark the science of public administration that regards the discipline as a field of business with emphasis placed on core government principles called the 3 Es of the Traditional Public Administration (TPA), namely, economy, efficiency, and effectiveness.

### Economy

In response to this call of making the discipline objective and verifiable, empirical studies on organizations and methods have intensified. These have been carried out in pursuit of the principle of economy, finding out the best way to carry out government objectives and activities with the most possible efficiency at least possible costs (Wilson 1887). As Wilson's call for a scientific study fell at that time on a ripe intellectual ground in the United States, many scholars (e.g., Frank Goodnow, Frederick Taylor, Henry Fayol, and Luther Gulick) subsequently conducted thorough studies that draw attention to the organization and internal structure of public agencies, bearing in mind the tenet of accomplishing public functions with the greatest productivity but at least cost. With this movement comes the considerable accent on the administrative function of economy that heavily centers on external and materialist objectives.

### Efficiency

Efficiency can be regarded as a twin concept of economy. Similar to the principle of economy, efficiency signifies the achievement of a bureaucratic goal with competency but expended with the least time and effort. A common bureaucratic procedure that is employed to achieve greater efficiency is through what is called public reorganization. It means re-grouping various public sector agencies in a way that public goals can be achieved with least cost, and at the same time, incorporating a chain of command and ensuring responsibility. Due to the unique mandate of the bureaucracy to provide goods that are "public" (in contrast to the nature of goods provided for by private companies), it is argued that measuring efficiency in the public sector is difficult (Erkoc 2017).

### Effectiveness

Effectiveness is highly associated with the principles of economy and efficiency. It denotes goal fulfillment, focusing on the objective(s) set forth by an organization and closely anchoring this/these on the needed steps in order to accomplish the overall mission. Moreover, it means the provision of public service delivery performed by the necessary national and local authorities. In order to assess the effectiveness of the provision of a public good, one method is to examine the amount of resources allotted to the program implementation, the outputs (the actual work completed), and the outcomes (key direction of improvements) (Demin 2016).

## Modern Public Administration: Towards 5Es and an a

In spite of the progress that TPA has able to advance, the discipline of Public Administration has been tainted by an identity crisis, emanating from what Rutgers (1998) pertains to as an epistemological identity. This situation paved the way for the beginning of the Modern Public Administration (MPA), a school of thought that began in the 1950s and has continued up to the present time.

The early schools of MPA, specifically the Development Administration and the New Public Administration, surfaced due to the growing prosperity of a society that fails to meet the needs of the public (Brillantes and Fernandez, 2008). This identity crisis has resonated loudly in the Philippine Public Administration as the country confronts intractable poverty, unemployment, and inequality. As discussed by Reyes (2003a, b), the challenge is to make public administration both in terms of scientific discipline (Public Administration) and practice (public administration) aligned with the development objectives of the Filipino people. As the pursuit of social equity continues to be elusive in the Philippines (Brillantes et al. 2019), the principles espoused by MPA have carved out a greater grounding in the country.

It is within this ambit that the academic discipline of Philippine Public Administration needs to move beyond the 3 Es as propounded by the TPA. This is not to discount off the need for effective and efficient public structures and organizations in the Philippine government. However, given the terrains of development, or the lack thereof, in the country, the sole pursuit of 3 Es is not viable in the long run. There is an urgent need for a Public Administration that examines and meets the needs and demands of the Filipino people. As a crucial point to consider, Brillantes and Fernandez (2008) raise what can be considered as a more fundamental question in the Public Administration discourse: For whom is Public Administration in the first place?

Due to the chronic development gaps and cracks in the country, Philippine Public Administration has since its incipient stage necessarily extended beyond the 3 Es. A situational analysis of the Philippines necessarily assumes a normative dimension and points that PA has to be for the poor and the marginalized. It has been manifest that government rhetoric and interventions have not succeeded in fully integrating these groups of people in what is termed as the development process in the Philippines (Asian Development Bank, 2009; Brillantes et al. 2019; Intal, 2002). Given that administration has to largely cater to the public, an enhanced paradigm is vitally important.

## Ethics

Ethics comes from the Greek word "ethos" which means customs, usage, and character. Its scope typically includes traditional customs, habits, or character of a community. At a personal level, it refers to a person's conduct and to his/her system of values that determine what is right or wrong. In the practice of ethics within the ambit of public mandate, Rosenbloom and Kravchuk (2005) argue that public administrators need to act with responsibility as their work is linked to various areas of public service and can lead to abuse of public trust. Public officials are considered to a certain extent as "moral actors" (Stewart 1985) whose behavior ought to be distinguished by civil virtues such as responsibility, trustworthiness, honest, and impartiality (Demmke & Moilanen 2012).

In spite of the positive repercussions that good ethics may create in the public sector, upholding ethics in government practice comes out to be complex and challenging. As Sherman (1998) points out, there has been a growing concern relating to the lack of public sector ethics given the several scandals that have arisen in recent years. On a parallel note that Waldo (1980) argues that the twentieth century can be characterized by a decade of decay as to the lack of consensus on and practice of agreed moral codes.

Given the context of the Philippines, its public administration has been assailed with bureaupathologies that are manifest for instance in the widespread practice of nepotism in political and civil service appointments and promotions that

date back to the Spanish regime (Endriga 1979). In the sixteenth century, there was the practice of regarding public office as a grant or favor (*merced*) in exchange for their good acts for the king, such as participation in a conquest and pacification of a colony. At this time, public offices could be disposed of either by appointment or by purchase. The former was supposed to be excluded from sale; however, this was far from practice. The saleable public offices, on the other hand, were categorized depending on the kind of reward the purchasers seek to receive.

In addition, some Filipino cultural traits, such as family-orientedness, sense of conviviality, and debt of gratitude, that are still practiced until today are susceptible to nepotism as well. Valera (1996) suggests that these need to be re-interpreted so as to separate them from the possible conflict with the merit system instituted in the bureaucracy. Public employment patronage that feeds into creating factions and competitions between political parties acts as a stumbling block in the practice of ethics in public sector. Moreover, the practice of corruption, which seems to have spread like cancer, in the bureaucracy has also been a pressing concern. As Domingo and Reyes (2011, p.401) argue, corruption "remains a scourge in the government … contributing to the problem of underperformance in the country." With these ingrained malpractices in the government – or bureaupathologies – that there has been resistance against pursuing merit reforms in Philippine public administration.

In view of these bureaucratic malpractices that revisiting public sector ethics mechanisms offers new pathways in order to render greater public service and to forge not only any kind of public administration but an ethical one. One concrete mechanism that can be leveraged is the country's highest standard of ethics as embodied in the Philippine Republic Act No. 6713, or what is referred to as the Code of Conduct and Ethical Standards for Public Officials and Employees. This upholds eight norms of conduct that have to guide every government employee, namely, commitment to public interest, professionalism, justness and sincerity, political neutrality, responsiveness to the public, nationalism and patriotism, commitment to democracy, and simple living. A core part of ethics involves reforming the values, behavior, and mindsets of people (Brillantes and Perante-Calina 2018; Brillantes et al. 2020), and it is within this context that the Code of Conduct of public officials comes out to be a valuable compass for public affairs. As holders of a public trust, public officials need to abide by ethical values in order to satisfy public interest (Sherman 1998).

## Equity

Discussions about social equity can be traced back to ancient times, particularly in the era of Aristotle and Plato, who both argued that equity is a kind of justice that may transcend beyond written law and translate into practice (Rutledge 2002). Rousseau, on his part, attributes inequities found in society to unequal distribution (Rousseau 1992). Within the field of public administration, social equity took prominence in the 1960s and 1970s as a reaction to the mechanical and value-neutral government approaches (Wooldridge and Gooden 2009). Dwight Waldo convened the first Minnowbrook Conference in 1968 that pressed for the need to include social equity in the way public services are managed and distributed. H. George Frederickson, a Minnowbrook I participant, points out social equity as a crucial component of public administration (Gooden and Portillo 2011; Rutledge 2002). In fact, Frederickson (1990, 2010) regards equity as a pillar of same status in public administration as that of economy and efficiency.

Owing to a long history of colonization, the general tenor – both in theory and practice – of the Philippine bureaucracy demonstrates a close resemblance to American Public Administration. Among these foreign theories and models that have been adapted by the Philippines, the New Public Administration – with its emphasis on equity and social inclusion – is the theoretical framework that echoes greatest familiarity in the country given the needs of Filipino people. Pilar (1982) mentions that there has been a growing interest in coming up with indigenous models on

Philippine Public Administration that can best capture the plight of the people, but that there has been no full-blown indigenous model that has come to the fore. As such, he argues that "in the absence of an indigenous model of public administration, New Public Administration concepts provide a good beginning" (Pilar 1982, p. 234) and serve as a "worthy alternative" (Pilar 1982, p. 231).

Former President Ramon Magsaysay, who assumed Philippine presidency from 1953–1957, once said, "Those who have less in life should have more in law." This is to show that the clamor for equity has been a mandate of Philippine government since early on. Furthermore, the 1987 Philippine Constitution serves as the primordial framework that upholds equity and social justice. In Article XIII, Section 1, it clearly stipulates that "The Congress shall give highest priority to the enactment of measures that protect and enhance the right of all the people to human dignity, reduce social, economic, and political inequalities, and remove cultural inequities by equitably diffusing wealth and political power for the common good".

The Philippines has undergone moderate economic expansion, and yet, it has created limited impact in terms of poverty reduction (Asian Development Bank 2009). In the latest Association of Southeast Asian (ASEAN) Key Figures report (2019), the Philippines is the country with third highest poverty incidence in the region at 21.6%, next to Laos at 23.4% and to Myanmar at 24.8%. It is also the ASEAN country with the lowest poverty reduction rate between the years 2005 and 2017 (ASEAN 2019). Incorporating equity into Public Administration is thus an imperative and occupies a central place in the academic discourse. As Pilar (1982) argues, theoretical frameworks and models are hollow if they fail to respond to difficult situations. Equity, as part and parcel of Public Administration discourse, translates not only to greater quantities of outputs and macro-economic growth but signifies more importantly a public service which impact can be felt by the most deprived portions of the population.

## Accountability

As defined by the United Nations Economic and Social Commission for Asia and the Pacific (2006), accountability is one of the prerequisites of good governance. The urgency of the practice of accountability emanates from the principle that public office is a public trust. The Article II of Section 1 of the Philippine Constitution (1987) clearly stipulates that the sovereignty of the Philippine government "resides in the people and all government authority emanates from them." In conjunction to this, Article XI of the Philippine Constitution (1987) lays down clearly that public servants are to be accountable to the Filipino people at all times, and the former are expected to exercise authority for the welfare of the latter with "utmost responsibility, integrity, loyalty, and efficiency" (Article XI, Philippine Constitution 1987).

A foremost challenge afflicting Philippine government when it comes to accountability is its deep-seated problem on corruption. Endriga (1979) argues that there were some precolonial customs that might have been vulnerable to corrupt behavior, but he argues that the practice of graft and corruption in contemporary Philippine bureaucracy can be specially attributed to the colonial experience. He further maintains that it started out specifically during the Spanish period when compensation for public officials was nonexistent, and as such, officials were vulnerable to engage in corruption. Meanwhile, Alfiler (1979) gives emphasis on the post-war period. The latter asserts that similar to other newly independent states, the Philippines faced a host of internal problems, bureaucratic corruption being one of the foremost challenges. Corpuz (1965) argues that shortly after the Japanese occupation, the first wave of extensive corruption transpired, resulting in a broad network of graft and corruption that involved officials from the lower echelons up to the elite positions. All these bureaucratic habits formed during the colonial regimes have influenced the emergence and proliferation of corruption in the public sector.

This bureaucratic corruption has been sustained through various administrations up until contemporary period. Reflecting on accountability issues apparent in the Philippine government, Mangahas of Social Weather Stations (2001) observes that next to inflation, corruption has been the second-top cause of Filipinos' dissatisfaction with government. As manifest in some quantitative indicators like Transparency International's Corruption Perception Index, the Philippines has not been faring well in terms of accountability. The Philippines obtained a relatively low score since 2012: 34 in 2012, 36 in 2013, 38 in 2014, 35 in 2015, 35 in 2016, 34 in 2017, 36 in 2018, and 34 in 2019 (100 being very clean and 0 being highly corrupt). It ranked only 105th out of 198 countries in 2012, 94th in 2013, 85th in 2014, 95th in 2015, 101st in 2016, 111th in 2017, 99th in 2018, and 113th in 2019 (1st being the most clean and the 198th being the most corrupt).

Putting checks and balances in public sector organizations would aid in creating accountability. As such, there is a need for certain set of norms and criteria to evaluate the performance of public officials, including both elected and appointed ones. In this regard that Cariño (1983) puts forward these four standard questions: (a) Who is considered accountable? (b) To whom are they accountable? (c) To what standards are they accountable? (d) By what means are they accountable? Taking off from the question raised initially by Brillantes and Fernandez (2008) "For whom is public administration?", the following inquiry may be offered as well – "For whom is accountability?"

Accountability signifies an institutionalized relationship, which points out to regular, established, and accepted relations among various actors. It implies that officials – the so-called duty bearers – are responsible and answerable to the people – the "claimholders" – for their decisions and actions (Brillantes, Lopos & Perante-Calina, 2018). There is recognition of duties and commitments, and redress is undertaken when needed (United Nations Economic and Social Commission for Asia and the Pacific 2006).

## Conclusion

Given the development context of the Philippines, the foremost question confronting the discipline of Public Administration is not only in junction with its identity – "What is Philippine Public Administration" – but to expand the boundaries and inquire, "For whom is Philippine Public Administration?" The publicness of public administration signifies that emphasis should not be placed only on the traditional components of 3 Es, but primordial consideration must also be given to additional principles of equity, ethics, and accountability in order to create and sustain a public administration that is truly agile and Filipino people-oriented. As such, a Philippine version of Public Administration can be framed as the "5 Es and an A," juxtaposing effectiveness, efficiency, and economy with three other pillars, namely, equity, ethics, and accountability.

## Introduction: Public Policy and Ethical Analysis

Those who study public policy are studying how structures of governance affect human lives; that is, how legal, political, and regulatory practices impact the lives of those people affected by those practices. This study must necessarily involve contributions from several different disciplinary traditions: public policy must be made in the light of our best knowledge of psychology, of political science, of economics, and so on. The present question is what philosophical ethics can add to the study – and, ultimately, the practice – of public policy.

This question begins with a consideration of what philosophical ethics actually involves. Several different academic enterprises might be described through the concept of the ethical. *Descriptive ethics* studies the ways in which different societies have, at different times, arrived at different ideas about the nature of ethical right and wrong; it is best understood as part of anthropology or sociology. *Ethical repair* focuses on how those who now do wrong might be made to do right or at least do wrong less often; it is perhaps best understood as applied psychology or perhaps as a specialized part of psychiatric practice. *Professional ethics*, finally, generally refers to the specific codes and normative statements developed by each profession, to govern the limits of its professional obligations and permissions. Each of these relates to philosophical ethics as understood here, but none of these is the direct focus of this entry. The present focus, instead, is on how philosophical reason has tried to understand the nature of ethical right and on how the tools and methods of philosophers might be applied to clarify the craft of public policy.

What, though, does philosophical ethics look like, understood in this way? There is no single definition of the practice that would gain the assent of all its practitioners, but the following seems relatively uncontroversial: philosophical analysis involves the use of analytic methods to clarify what makes rightful actions rightful and the use of reasoned argument to apply these theoretical results in cases of ethical uncertainty. Philosophers have thus tended to produce and defend theories of morality, which explain what aspects of an action mark it out as rightful or wrongful; they have deployed these theories to defend or criticize particular acts and practices and have defended these theories against opponents. Philosophers have thus produced work that attempts to both theorize about the nature of the right and work that attempts to apply those theories to the disputed ethical questions of our time.

## Philosophical Ethics: Theories and Implications

It is impossible in this space to provide any great detail about what these philosophers have produced. It is possible, though, to identify two distinct theoretical methodologies, which together tend to dominate much of the discussion of philosophical ethics. These distinct methods do not exhaust the terrain here – there are a dizzying number of different ways in which ethics has been theorized – but they do represent the most numerous and significant theoretical structures yet devised. *Consequentialism* defines the nature of moral right with reference to the tendency of acts of a given type to produce beneficial consequences; these consequences are frequently associated with human happiness or well-being, but may range over the whole array of human goods (Kagan 1998; Sidgwick 1874). *Deontology*, in contrast, avoids discussion of the beneficial or pernicious consequences of action, in favor of a focus on whether or not that action is of a type that displays appropriate forms of respect for the agents affected by that action (Kamm 2008; Kant 1785). Deontologists generally focus directly on the idea of moral right, rather than on human goods or human interests, and derive the right as independent from the notion of the good.

Both of these forms of moral theory have, historically, had influence on the design and execution of public policy instruments, and those who developed these theories have been often worked both in the academy and in the field. Apart from historic interest, though, what is the point of reading about philosophical ethics? Philosophical ethics might be a good thing for an introspective person to think about; why should those who care about public policy and public administration believe it is relevant for their purposes?

There are, at the very least, two possible responses to this. The first is that setting the *purposes* of public policy is itself an ethical problem. If there are two distinct courses between which we might choose, each of which will lead to a slightly different world, we have occasion to ask which of these worlds is a better one. The nature of this *better*, though, is at least in part an ethical question; it is a question of what counts as better and how to understand the nature of what we hope our policies to achieve. We can think, for example, of the rise of the welfare state after the Second World War, which was justified with reference to an ethical belief in the moral wrongness of some forms of poverty. Philosophical analysis of the ethics of poverty took root in the later part of the twentieth century, with John Rawls writing the most notable of several analyses of how income inequality might be understood from the standpoint of ethics (Rawls 1971). Political philosophy, which is sometimes understood as the application of philosophical ethics to politics, took flight after Rawls's writings and offered a site within which philosophers sought to discuss and debate different theories of why and how different forms of poverty were morally impermissible. Rawls's own views were greatly influenced by those of Kant and sought to apply ideas similar to those of Kant to the specific question of how a political society might do justice to all those living within that state. Thus philosophical ethics reached both into the world of policy, seeking dialogue with professionals about how poverty is lived and might be addressed, and into its own past and used the ideas of a previous time to understand how we might think about the wrongness of poverty today. The relevance of philosophical ethics to the practice of public policy is not necessarily direct; it is, of course, possible to do work in public policy without engaging in philosophical reflection. But the reflection here offers several possibilities to the practitioner and to those who study that practice. It offers, first, the possibility of a justification for the concerns such policies seek to address. Philosophical writing can help motivate the thought, for example, that society *ought* to be concerned with poverty, by providing us with some ethical reasons by which we might understand why poverty is worthy of our direct attention. More importantly, the use of philosophical reflection can help provide policy-makers with *guidance*, in those areas in which there is less confidence in the morality of a given goal or instrument. There are times when reflective agents are genuinely unsure about the ethical permissibility of a given act or practice; philosophical analysis can offer at least some clarity, by

demonstrating how philosophical theories might interpret the morality of what is proposed. Philosophical ethics can, in short, offer us the possibility of *explaining* our moral beliefs in those areas in which we are confident, and of *guiding* those beliefs in the areas in which we are less confident.

The second purpose of philosophical ethics, though, might focus on means rather than on ends; it would identify the range of *permissible* pathways for policy intervention. Even if policy-makers are confident about the nature of the society they seek to create, that is, they have reason to think more about how they are allowed to get there. It is entirely possible that the most direct path to the world they desire is a pathway they are not permitted to travel. Philosophical ethics, by specifying the ways in which people are immune from certain sorts of treatment, can identify the ways in which agents are prohibited from achieving their goals. It is possible to think, here, of philosophical ethics as a companion to economics. Economics, by studying how people make decisions under uncertainty, can offer policy-makers knowledge of which pathways to a desired goal are more likely to succeed. Philosophical ethics, in turn, tells those policy-makers which of those pathways they are obligated to avoid. Rawls, again, provides a useful example. He argues that, even if a society could effectively address entrenched poverty through a centralized government ministry of employment – charged with assigning people to jobs in accordance with some ideal distributive pattern – that society would be morally prohibited from doing so. People have rights to be free from this sort of coercion, even if that coercion were effective in undermining inequality. There are policies that a society cannot adopt, that is, even if those policies were to do good things – and philosophical ethics can help us understand when, and why, those policies are so forbidden.

## Broadening Ethical Analysis: Diversity and Agency

Philosophical ethics, then, is at least potentially useful in the practice and study of public policy. It is worth introducing, though, two complications. The first is that much recent philosophical analysis has focused not simply on the ethics of the policy, but on how that policy might be justifiable to a society in which there is a great deal of diversity at the level of ethical belief. Diversity, after all, includes not just diversity of ethnic and cultural origin, but a diversity of ethical theory. How, though, can a democratic society decide what makes a given result a valuable one, when the inhabitants of that society disagree about the nature of value itself? This has been the focus on John Rawls's later work, which has proven influential as well in the analysis of the ethics of public action (Rawls 1989). One key has been the recognition that public policy professionals have a reason to care about justifying their policies to citizens from diverse backgrounds and thus have a reason to seek justifications that do not rest upon particular and controversial moral principles. How this might be done is, of course, controversial – but Rawls's own thought, on which liberal societies must seek a public conception of justice, decoupled from controversial matters of metaphysics and ethical truth – is at least a possible way forward. Democratic societies are obligated, on Rawls's account, to build a public method through which they speak about justice in public, and then to use that method in the public adjudication of competing claims; policy-makers cannot, instead, simply cite their own particular moral beliefs and expect them to be dispositive against those who do not share them.

The second complication takes off from this and notes that there is at least possibly an ethical conflict, between the personal ethics of the professional and the ethical purposes of the organization within which she is situated. When one is employed by an organization seeking to build a particular sort of world, and one is convinced that that world is not the one we ought to be seeking, what ought one to do? This sort of question is wrenching, and easy answers seem to be bad answers; we should not be blind followers of our superiors, but neither should we simply resign in anger at any minor difference of belief about what the best society truly is. Arthur Applbaum's work has dealt extensively with these issues and has used a Rawlsian method to derive an ethical framework through which they might be

understood (Applbaum 1999). Applbaum suggests that we ought to divide, as Rawls does, between the public conception of justice with which we evaluate claims in the public realm and our own best personal understanding of what the right thing to do is. When we are part of an organization whose activities go against our own personal moral beliefs, we are entitled either to continue working or to resign quietly; we have no right to become ethical entrepreneurs, seeking to directly undermine those in whose employ we serve. In contrast, when we are convinced that the organization employing us is directly working against the rights and values implicit in the public political conception of justice, we have a greater permission to undermine that organization; we can resign rather more loudly or make the organization's way forward more difficult. Policymakers can, in short, become enormously difficult employees and do so in the name of ethical values.

## Conclusion

Regardless of whether or not one agrees with Applbaum, it should at least be clear that there are important ethical questions to be asked not just about the purposes of public policy, but about the duties and rights of policy professionals. Sustained analysis of this question – and of the related question of how to respect the diverse population of a modern democratic society – is likely to continue on these topics. This entry is intended to have achieved only a rather modest goal: that of arguing that philosophical ethics might be a valuable part of that continuing conversation.

# Planning for Public Procurement

Christopher L. Atkinson
University of West Florida, Pensacola, FL, USA

## Synonyms

Planning of procurement; Planning phase

## Definition

The planning phase of public procurement, occurring at project inception and part of the pre-award phase of public-sector contracting, considers technical specifications, cost and pricing questions, and choice of solicitation methods. The phase precedes contract award, administration, and close-out.

## Introduction

The planning phase of the public procurement cycle is essential. It is during the planning phase that the choices about procurement are made to align with the project specifications. Decisions are made on how to specify the services and products being purchased, how to determine appropriate cost and acceptable pricing, and what solicitation method is most suitable (Khan 2018). During this phase, a procurement team is formed of acquisitions professionals, subject-matter experts, and administrators responsible for the contract or purchase. A timeline for the procurement activity is

developed to assure that the product or service can be acquired when needed, allowing for the process to maximize priorities like competition and any opportunity provided for socioeconomic programs within the specific government interest.

The planning phase is part of the pre-award phase, and precedes selection and award (contract execution) activities, contract administration, and contract close-out. Guarnieri and Gomes (2019) also include "selection of suppliers, certification and qualification" (p. 313) as part of the planning phase in strategic procurement. Expending due time and resources in the planning phase to make wise procurement decisions is necessary to avoid costly mistakes. Goods and services purchased without careful planning may be unacceptable for a variety of reasons, resulting in delay and additional expense.

This entry considers the planning phase of the procurement process in its public guise, and specifically provides an overview of the planning phase, and problems associated with incomplete procurement planning.

## Overview of the Planning Phase

The literature on public procurement has focused heavily on the purchasing activity (solicitation) (Wang et al. 2020). While some attention is paid to planning, discussion tends toward description and setting the scene for solicitation, contract award, and contract administration as primary purchasing activities. Nevertheless, the planning phase of procurement is important in its own right, with its attention to market research, technical/project specifications, cost and pricing questions, choice of solicitation methods, scheduling and development of a timeline for the procurement, creation of a procurement team to support the acquisition, and possibly prequalification or short-listing of available vendors that can supply the needed products and/or services (Khan 2018).

Public procurement professionals often serve in a generalist role, expected to support a broad range of purchases, but possibly are lacking expertise in specific products and services. In order for these staff members to professionally and skillfully serve as administrative experts on processes leading to successful acquisition, conducting considerable, even extensive market research is anticipated. This lays important groundwork so that the procurement staff member can bring knowledge to bear on the purchase in question, and avoid costly mistakes in acquisition. The expertise of the staff member also acts as a check on the involvement of others, including agency contacts, elected and other officials, and members of the business community, who may seek to guide the process in less than competitive fashion toward preferred vendors and preconceived outcomes. This also helps with the development of high-quality technical specifications, which "describe in a clear and concise manner the required standards and quality of goods and workmanship as well as performance of services to be procured" (Khan 2018, pp. 35–36). These technical specifications subsequently become part of the solicitation document, and then the eventual contract between the public-sector entity and the selected vendor(s).

A request for information may be sent to gather information about supplier capabilities, availability of solutions on the market, and how best to formulate a procurement so that it results in successful acquisition of the needed supplies or services. As technical specifications guide the function of the contract and provide terms for the work involved and materials to be supplied, it is essential that they are correct and complete.

During the planning phase, some notion of the cost of the project is formed, through estimates provided to the procurement activity or as a result of the market research described above. In order for government to receive goods and services at a fair and reasonable price, it is necessary to know generally whether a tendered offer is fair; government must have accurate information on what vendors will charge for the products/services, and this information to support such estimates is gathered in the planning phase. A price analysis is "an evaluation of the offeror's price relative to the prices being offered by other vendors and being paid by the general public for the same or similar

items," and is thus most appropriate when the purchase involves a commercial product (USFTA 2017). Absent the ability to analyze price, a cost analysis is conducted, involving "the review and evaluation of the separate cost elements and the proposed profit of an offeror's cost proposal. A cost analysis is conducted to perform an opinion on the degree to which the proposed cost, including profit, represents what the performance of the contract 'should cost', assuming reasonable economy and efficiency" (USFTA 2017). The objectiveness of the eventual price or cost analysis, after the planning phase, is rooted in thorough understanding of the specifications and market forces at work in the case of a specific procurement.

During the planning phase, decisions are made on the best approach for solicitation – whether requests for bids, requests for proposals, or some other form. The decision is guided by the type of products/services being procured, the timeline of the project, and project complexity, among other factors. As an additional matter for the planning phase, when contracts are especially complex or valuable, there may be a pre-solicitation effort to engage in some type of prequalification of vendors. Prequalification may help with ensuring "that those who intend to participate in bidding have the necessary qualification in… technical expertise, experience, financial standing, and capability to be able to successfully deliver the contract" (Khan 2018, p. 35).

## Problems Associated with Incomplete or Insufficient Planning

Effective planning, while adding to the time and resources needed for a procurement over the short-run, can help avoid mistakes that could prove costly in financial respects and timeliness later in the acquisition process. Given the highly regulated environment of public procurement, failing to account for requirements at any stage of a purchase is possibly cause for stopping a whole process and returning to some earlier stage, if not the very beginning, of the process. This extends to the point of solicitation and award, when bids or responses received may have to be rejected because critical aspects of the purchase, like timing on receiving the product or service, or involvement of key staff, partners, or related purchases, were not adequately considered during the planning phase. In addition to being responsive to restrictions, any other demands of the entity as outlined in its procurement laws/regulations/code must be addressed. Failing to include these, too, can delay processes, jeopardize project funding resources due to delays, and even prevent project completion. Planning allows time for attention to these matters.

Some government purchasing programs, such as those supporting information technology, occur in a context that requires attention to what has already been purchased, interoperability of software and hardware, and plans for future upgrading. The questions that arise in such environments about which choices to make to accomplish acquisitions processes that are most advantageous to the government client, are inherently planning-oriented. Master plans for information technology purchases are used in some cases to assure acquisition of useful products and services, avoidance of waste, and to meet legal demands (Da Silva Barboza et al. 2016).

Any public involvement in the setting of specifications and obtaining comment would naturally and most appropriately occur during the planning phase (Torvinen and Haukipuro 2018). This is a notable point, because some pushback and protest of government purchasing in controversial situations could be avoided with greater transparency and public disclosure. It is perhaps not common to involve civil society in procurement, as contractors are responsible for production of goods and services, but the planning phase does offer some opportunity for involvement, even given an assumption of general competence for the development of specifications and research associated with the procurement activity (Cravero 2019).

Some research has shown negative impacts from inattention to the planning phase, and

especially a lack of market studies and research (Gutiérrez Rodríguez 2020). In the development of specifications, improved understanding of requirements can be of great benefit to the success of a project, as demonstrated by Wondimu et al. (2018). Some recommend more contractor involvement in early project phases, to enhance specification, improve project timelines, and provide for cost-efficiency (Love et al. 2014). However, the pressure of the public procurement environment to quickly develop solicitations and award contracts does not always afford value to the planning process commensurate with its worth. Pressure on planning timelines can have serious financial implications for project partners engaged in design activities relevant to specification, such as architects (van den Hurk and Siemiatycki 2018), while also leading to increased potential for diminished outcomes for the project as a whole.

Miroslav et al. (2014) identified the planning phase as a point where corruption is possible – a measured, deliberative planning phase can help sort out a tendency toward rushed procurements with corrupt intent. Asiedu and Adaku (2019) suggested that poor planning leads to cost-overruns, which aligns with the notion that shorting the planning phase to force pre-determined, corrupt outcomes may be purposeful. The planning phase is also a point at which elected officials are likely to intervene (Hudon and Garzón 2016), which may increase the potential for outcomes that serve personal interests, rather than advantaging the government client.

## Conclusion

As a result of primarily political efforts to create a more business-like government, public procurement processes have found themselves occasionally squeezed for time and resources, resulting in essential activities like those that occur in the planning phase, and compliance/enforcement actions later on in contract administration, to be undercut. Providing less than adequate resources to the planning phase may seem a reasonable way to save time and money, but could simply invite waste and corruption. The benefit of a considered process far outweighs any small benefit of hastily prepared and solicited public contracts. Because public procurement occurs in public space, it is essential for procurement professionals to maintain transparency and hold true to the processes as required by law, even if this means declining to fast-track purchases when doing so would be inappropriate. Adequate attention in the procurement process to consistency, fairness, and reasonable action allows for integrity of the system, and results in the best outcomes for the government client.

# Planning Organizations, Latin America

Luis Bernardo Mejía-Guinand
Faculty of Social Sciences, Department of Political Science, Universidad de los Andes, Bogotá, Cundinamarca, Colombia

## Synonyms

Planning agencies; Planning institutions

## Definition

The planning organization is a public agency within the executive in charge of defining and recommending public and economic policy. It determines objectives, goals, and strategies of medium- and short-term plans within the framework of long-term perspective and formulates policy actions for the achievement of planned goals. The planning agency takes different structural forms, for example, an administrative unit inside the office of the President or a collegial body such as a commission. In Latin America the most common arrangement of the planning office is a ministry or department.

## Origin

During the 1950s, the United Nations Economic Commission for Latin America (ECLA) suggested that government's principal task in the region was to provide long-run direction for economic development through economic planning. This approach was reinforced in 1961 when President Kennedy proposed a 10-year plan for Latin America, known as Alliance for Progress. The program, signed by 20 Latin American nations at an inter-American conference at Uruguay, required participating countries to construct comprehensive plans for national development and to establish planning agencies as prerequisites for receiving economic aid (Leiva Lavalle 2010).

In this context, ECLA created the Latin American Institute for Economic and Social Planning (ILPES) in 1962. The purpose of this institute was to support the Latin American Governments in the area of planning through the provision of training, advisory, and research services, especially on how to set up a central planning office inside the government's institutional bureaucracy (Waterston 1966). Following ECLA's advice, almost all Latin American governments embraced planning organizations as an instrument for bringing about necessary structural changes but most importantly as a tool for mobilizing national resources and qualifying for international aid under the Alliance for Progress. Those Latin American countries that had not yet established their central planning agencies during the 1950s created them throughout the 1960s (Argentina, Barbados, Bolivia, Brazil, Chile, Costa Rica, Dominican Republic, El Salvador, Haiti, Mexico, Nicaragua, Paraguay, Peru, and

Uruguay), while other countries like Colombia, Ecuador, Guatemala, Honduras, Jamaica, Panama, and Venezuela strengthened their existing planning offices.

## Organizational Structure and Functions

Throughout the 1960s, there was a variety in the organizational arrangement of the planning agencies in Latin America, ranging from collegial bodies to ministries. For instance, in countries such as Uruguay, Honduras, Guatemala, El Salvador, Ecuador, Dominican Republic, and Argentina the planning agency adopted the organizational form of commission or board. These collegial bodies consisted of five to seven members, who tended to represent several of the economic-related ministries. Commissioners were appointed by the President and the functions of the organization were normally advisory in nature. In countries such as Brazil, Colombia, Mexico, and Paraguay, the planning office took the form of a ministry or department. These ministries were usually immediate subdivisions of the Cabinet and subordinate to the President. The planning organization also took the form of an administrative unit within the internal organization of the executive office of the President. This was the case of Chile, Costa Rica, Panamá, Venezuela, and Nicaragua, where the director of the planning office was one of the closer advisors of the President. Finally, Bolivia, Haiti, Jamaica, and Peru developed their central planning organizations as an administrative agency that was usually subordinate to the ministry of finance (Mejía-Guinand 2016).

Regardless of the various structures given to the planning organizations in the region, or their specific placement within the bureaucratic hierarchy of the executive branch, the planning agency was conceived as a central body meant to work across government departments or ministries to provide advice to the President on economic development, as well as ensuring policy coherence and coordination on his behalf. In this sense, the central planning agencies had either formal or informal authority over other departments, ministries, and administrative agencies and often directed their actions. The planning body differentiated itself from other public organizations because it did not involve the representation of a specific sector of public administration. Rather, the planning agency was concerned with the formulation of development and economic policy for the state as a whole, as opposed to the representation of one segment of the economy or substantive area.

All over the region, the planning bodies were assigned with functions related to: (i) advising the executive on the preparation of the National Development Plans based upon macroeconomic analysis and econometric models; (ii) assisting the President on economic matters; (iii) coordinating the development activities of line ministries or departments; and (iv) conducting studies concerning the national economy (Waterston 1966). In many countries, the planning organization also performed specific tasks related to: budget assignment and prioritization; administration of external credit financing; regulation of economic sectors; macroeconomic forecasting; and public administration reform.

The functions assumed by the central planning offices were supported by the appointment of experts in key positions inside the organization who, in many countries, were isolated from customary political patronage networks. Almost since their creation, these agencies, not only absorbed the economic experts working in ECLA, but also international technical assistance specialists that came from the International Bank for Reconstruction and Development, Harvard University, and the United States Foreign Operations Administration.

This technocratic bureaucracy gained widespread visibility in Latin America after the 1960s, following the onset of military rule in Brazil, Argentina, Chile, and Uruguay, when economists trained at the Department of Economics of the University of Chicago were appointed in high positions in the planning agencies as economic advisors. They advocated widespread deregulation, privatization, and other free market policies for closely controlled economies.

Guillermo O'Donnell (1973) typified these governments as bureaucratic-authoritarian regimes, characterized by the exclusion of organized groups, political parties, and Congress from economic policy making, as well as by the faith put on technical solutions thought as "apolitical" to solve national problems. The central planning agencies, together with the central banks and ministries of finance, stood out as efficiency pockets vis a vis public administration.

## The Waves of Change in the Planning Agencies

By the end of 1970s, the economic model of state intervention in Latin America was reaching its limits and its political support was gradually eroding. The massive foreign debt of countries in the region and macroeconomic problems, especially inflation and fiscal deficit, contributed to blur the fundamental premise of import substitution industrialization as a growth strategy. Instead the principles of free market forces and state retrenchment gained widespread acceptance in the region. In this context, the planning agencies adapted to the changing environment, moving from centrally determined economic priorities and plans to the use of project appraisal techniques and compilation of the investment proposals directly prepared by the national ministries, local governments, and semipublic corporations.

Led by the ministry of finance and the planning organization, Latin American countries introduced a package of structural reforms in their public sector that focused on three areas: (i) the liberalization of the price system and markets; (ii) the opening of foreign trade and external financing operations; and (iii) the reduction of government intervention in the economy. The capabilities for project appraisal and the prioritization of public investment of the planning agencies were reinforced in order to implement the structural adjustment programs. Additionally, by the early 1990s, tasks related to negotiating international cooperation, poverty reduction, and dealing with the public sector restructuring, started to appear as an additional mandate of the planning agencies. For example, Chile transformed its planning office (ODEPLAN) into the National Ministry of Planning and Cooperation (MIDEPLAN), assigning to the organization new responsibilities of handling international cooperation and coordinating poverty reduction programs. In Costa Rica, the National Ministry of Economic Planning (MIDEPLAN) assumed functions related to state modernization and international cooperation (Mejía Guinand 2014).

While the central planning agencies were the natural candidates to disappear in this context of promarket and multilevel planning public sector reforms, they persisted in the region, with the exceptions of Mexico, Peru, Honduras, and Panama. Mexico turned off its Secretariat of Programming and Budget in 1992, transferring many of its functions to the Secretariat of Finance. Peru deactivated its central planning office (National Institute of Planning) in 1992 under the state modernization reforms followed by the Fujimori's government, while Honduras disengaged its office (SECPLAN) in 1996. Finally, Panama merged the Ministry of Planning with the Ministry of Finance in 1998, creating the Ministry of Economy and Finance.

Throughout the 2000s, Latin American governments that had come to power in the 1990s, and in many cases favored promarket policies, were replaced by administrations leaning to the left. Left governments in Argentina, Bolivia, Brazil, Chile, Ecuador, Guatemala, Honduras, Nicaragua, Paraguay, Uruguay, and Venezuela highlighted the necessity of bringing back the intervention of the state in the economy. In this context, Peru reactivated its central planning agency in 2005 with the creation of the National Strategic Planning Center (CEPLAN). In 2004, Ecuador transformed the old Planning Office (ODEPLAN) into the National Planning and Development Secretariat (SENPLADES), assigning it a predominant role in the budgetary process. Bolivia restructured the Ministry of Sustainable Development into the Ministry of Development Planning in 2006, with the task of being the main governing body of the National Planning and Public Investment Systems. Argentina reorganized its Planning Secretariat into the

Ministry of Federal Planning, Investment and Public Services, assigning it with regulatory functions in transport, mining, communications and energy policies. Finally, Brazil assigned the Ministry of Planning and Management the tasks of monitoring and evaluating the public investment in 2000.

Currently, 16 out of 20 Latin American countries have central planning offices in place. Unlike the 1960s, when there was more variety of organizational arrangements among the planning offices, today there is more homogeneity. Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, Dominican Republic, Haiti, Uruguay, and Venezuela have planning offices under the figure of ministry. Planning agencies in Ecuador, Guatemala, Paraguay, and Uruguay operate as a technical entity under the Presidency of the Republic. Finally, Nicaragua and Peru have their central planning agencies as collegial advisory bodies. These figures indicate that 87.5% of planning entities in Latin America are currently under direct influence of the President (Mejía Guinand 2014). Regarding the functions being carried out today by the planning agencies in the region there are some commonalities across most countries as well as distinct functions in specific countries. For example, functions relating to the formulation of the national budget, evaluation of public policies and formulation of development plans are still present across most planning agencies in Latin America, while functions related to poverty alleviation and regulation are present only in certain countries. Table 1 presents, for a sample of countries, a summary of the key functions carried out today by the planning agencies.

## A Useful Organization

The planning agencies have had a unique role within the public sector in Latin America. Together with the central banks and ministries of finance, these three organizations have stood out as efficiency pockets and as a center of information to the presidential office. In concrete, the planning bodies have been important in four aspects. First, through this organization Presidents

in the region have mobilized resources coming from foreign aid. The international organizations and donors needed an agency that could "do things right" and trusted the planning agencies. Second, the planning agencies have served the President, as a filter to veto projects from politically powerful ministers and control the spending appetite of the line ministers. By means of project appraisal tools within the organization, governments can rationalize the national budget and provide technical viability to public investment budget. Third, presidents have used the planning organization as an instrument to explain how national goals and economic growth can be achieved. In this way, the organization provides the President with technical justifications and legitimacy. Finally, the planning organization has provided Presidents with accurate information for policy analysis, and decision making. Over the years, a stock of information and data was accumulated and consolidated in these agencies, becoming a valuable resource for the President's office to design its priority policies.

## Conclusion

The planning agencies in Latin America have undergone multiple transformations in their structural design. In all countries, the planning body came to life during the late-1950s in response to a development strategy that required the state to provide long-run direction to economic development by means of economic planning. Three decades later, the same agencies were reshaped to serve the purposes of an entirely different development strategy. The planning body in these countries started to perform functions suitable of a free market development model, shifting away from their prior focus on an inward development strategy. Subsequently, Latin American countries started to experience a rebirth of the state's economic presence around 2000, including a new reforming of the economic planning agencies. In between these three distinct strategies for economic and social development, the planning agencies were continuously assigned and redirected toward a wide range of tasks as seen necessary, providing always useful support to the President.

Conception; Forethought; Program; Strategic plan

## Introduction

It has been discussed a lot about planning and its importance in public sector. From practitioners to scholars, one can say that it is an emblematical topic when it comes to quality of public administration. Although recent academic literature strives to bring new elements to an old concept, the idea of planning remains quite simple. It represents the design and construction of administrative procedures for determining the trajectory which the organization has to take in order to

achieve a desired purpose. To some extent, all organizations engage in planning, even if only loosely and intuitively (Boyne 2001).

Authors advocate in favor of its widespread use in all levels of government and public management. This is not by chance, in fact the statistical evidence shows that organizational performance is positively related to favorable attitudes towards planning processes (Boyne and Gould-Williams 2003).

The focus on planning is answering how the organization is going to achieve the previously determined goals (Raczkowski 2016), what requires the best choice among several potentially valid strategies. Thus, it does not make sense to talk about planning in the current stage of public organizations without implicitly conceiving the idea of strategic planning in any application, theoretical or practical. However, it is worth mentioning that the adoption of this adjective in planning concept is quite recent.

The evolution of planning, which occurred simultaneously with a series of related reforms, was implemented aiming on making government more productive, responsive, and focused on performance (Hendrick 2003). It reflected large-scale organizational changes and adjustments occurred in the United States and England between the 1970s and 1990s, gradually incorporated in Brazil and other countries.

Ever since, the concept has been conceived as an important element of the decision-making process in both private and public sector. In a classical text on planning, Ackoff (1970) defines it as effective ways of bringing a design of a desired future about. In other words, an anticipatory decision making, i.e., an instrument, is used nowadays to reach larger long-run benefits.

To varying degrees, the structural conditions that made effective strategizing by the public sector in the 1980s and 1990s remain until nowadays. The immediate context in which it takes place has evolved and, potentially, enhanced the effectiveness of decision making and planning (Brown 2010).

However, when making decisions of general relevance and interest, public sector bodies are called to demonstrate that such choices not only regard costs and benefits but are also based on evidence and acknowledge uncertainty. Today's turbulent times make these efforts even more compelling (Genovese 2018). For this reason, it is fair to say that planning has become even more valid and valuable compared with the past.

Currently, planning concerns adaptation and overcoming obstacles. In the face of important changes, either in the internal or external environment, public managers have to be able to engage with offices and manage public resources for anticipating actions in order to rebuild necessary paths to achieve the desired goals.

This is even more relevant in the public sector, since its plans involve achieving the collective good. However, contrary to common sense, the will of the majority is not, as a rule, taken into account. However, the competitive interests of various groups in society have to be considered in the process of planning; it does not always realize the common good (Fox-Rogers and Murphy 2014).

Planning is necessary not only to build the basis for government success, but also to ensure the best conditions for allocating scarce resources among competitive projects. For this purpose, it is required a worldwide attitude, and for accountability reasons, no government can be deprived.

Some of the key benefits of planning are: promoting strategic thinking; building the needed coalitions of support; improving decision-making; enhancing overall coordination; adapting to environmental changes; addressing broad public problems; improving organizational legitimacy, creating real public value; and directing benefits for the people involved (Bryson 2010). Public managers need to link the planning with performance management processes in response to the continued pressure for accountability, as well as their own commitment for managing results (Poister 2010).

Although planning is a universal practice and several of its elements are of widespread use, one should not consider that it is the same in all parts of the world. Specific conditions in developing country such as Brazil make planning even more

challenging. Among these factors, it is worth mentioning political context, social problems, economic fragility, public financing, fiscal federalism, and lack of infrastructure as following discussed.

Political context: A transitional democracy is still present in the Brazilian political context, which is shaped by a coalition government and a multiparty system, generating fragile conditions of governability. The party polarization experienced in recent years is an additional challenge, since some level of compliance with the government plan and actions is necessary to ensure the stability of government and the success of planning.

The need to create coalitions with multiple and competing objectives in order to gain passage of legislation can result in a lack of policy clarity in public sector, which Baumer (1978) described as "Shaky Coalitions." Even through the planning process, it can become a huge issue during the implementation phase, since it is a multiannual task and demand annual support.

Social problems: Brazil has made many advances in social aspects in the last two decades such as reducing extreme poverty, promoting the schooling of children and adults, creating of social inclusion programs, and improving quality of life in urban and rural areas. On the other hand, aspects as labor productivity, health conditions, public safety, and employment are still great challenges for implementation of the government plans, especially actions for socio-economic development.

Economic fragility: Economic conditions directly influence planning, either because of the unpredictability of macroeconomic scenarios or because of microeconomic conditions and their impacts on growth and public financing. Strong currency fluctuations, high interest rates, and high unemployment are some of these elements.

Public Financing: Planning requires a huge budgetary effort to maintain a regular cash flow aiming to carry out the planned actions, particularly in an unstable economic environment. It comes under controversial conditions since the largest source of budget is taxation. The additional means of public funding, like those coming from public companies, concessions, privatization, and sales of public assets are more complex. Therefore, public spending and growth are the central elements for maintaining adequate planning conditions.

Federalism: Federalism system is a condition of great complexity when it comes to put any public plan in action. The three layers of government have to strictly comply with the federal constitution to carry out multiyear planning (PPA), Budget Guidelines Law (LDO) and Budget Law (LOA), known as the three pieces of planning and budget in Brazil. The latter is the public budget, which requires the support of the majority legislators to be approved annually. In these pieces of planning lay the foundation for building the analytical budget, which establishes the resource allocation map for the coming 48 months. Additionally, it sets financial priority for the coming year, targets for each government agency, and short and long-term goals for every sector, as well as area of public administration. Moreover, different levels of government implement many interconnected policies requiring coordination and institutional arrangement for the construction and success of the plan. It is a multidimensional process sharing responsibilities among the three levels of government and several public agencies; it means that the lack of responsibility of one of them can jeopardize the whole process. Planning in this environment requires what Jenkins (2006) calls interoperability or collaboration over adaptation, i.e., a reciprocal communication and accommodation of interest in order to reach interactive operating policy and programming.

Lack of infrastructure: Infrastructure is an essential condition for a country to grow and thrive. Both the public and private sectors are dependent on adequate infrastructure conditions to optimize their plans. Planning is the necessary condition to achieve the right infrastructure, leading to a virtuous cycle of processes. Moreover, we know that infrastructure deficit causes a substantial part of the inefficiency and lack of productivity. However, including infrastructure investments in development plans requires enhancing the

quality of public spending, generating primary surplus, reducing interest payments and long-term commitment, the major challenges in Brazil, since there is still a culture of disruption, misuse of public resources and inefficiency, especially in large contracts.

Social participation: Although law requires social participation in many public policies, Brazil has been timidly expanding citizens' participation in government, especially when it concerns planning. Participatory planning and participatory budgeting experiences are the exception rather than the rule in all different regions of the country. Although the national government's philosophy regarding the importance of participation has great relevance in this process, we have been experiencing changes in the opposite direction.

What can we expect from the evolution of this concept in the following years? It is fair to assume the increasing importance of this theme in the public sector, as well as in complexities. The question that remains is how to connect all elements in order to constitute means of overcoming the barriers and limitations imposed for achieving the desired results. The current literature suggests a practical integration with the idea of strategic management, that is, the active dynamics of results-oriented planning in an environment of greater transparency and accountability. It includes operational and business planning, budgets, workforce development and training, other management and administrative processes, internal and external communications, analytical and problem-solving capabilities, program delivery mechanisms, legislative agendas, leadership skills, and an organization's ability to influence other actors (Poister and Streib 1999).

Finally, one can say that there is a perceived shift from ideas of inward-facing planning committed only to the principles of the public sector to a multidimensional orientation and to the whole society values, involving the private and third sector in the construction of a common interest result. However, regardless the change of focus with the likely incorporation of some new adjective, the original idea and the importance of the planning will remain quite the same. As Ackoff (1970) claimed decades ago, "the need for planning is so obvious and so great that it is hard for anyone to be against it." Thus, the operative question for public managers is how to make planning an increasingly effective and interesting tool.

# Planning, Diversity, and Personnel Leadership

Lee M. Allen
Department of Political Science, Valdosta State University, Valdosta, GA, USA

## Introduction

The three concepts of planning, diversity, and personnel leadership share an imperative nexus: to alleviate suffering and prevent conflict and war. Without intervention, resentment and reaction to intolerable discrimination may lead to global disruption and a serious if not fatal end to modern civilization. Another commonality in these three overlapping focal points is the duty to maintain all of the unexplored resources inherent in the global population. Unknown potentialities of the human genome, yet to be manifested cultural and spiritual arts, and preservation of the material and intellectual tool kits developed to cope with humanity's myriad of environmental challenges all promise to help achieve undreamed advances in health, wealth, and well-being. The role of global leadership in this effort is to plan and implement diversity policies to realize these aspirations.

One of the roots of modern personnel leadership in the public administration discipline is government planning to meet future challenges and problems. Historically, examples can be found as early as Pharaonic Egypt, when grain was stored in warehouses for possible years of food shortage and famine. Administrative leaders had to be found to oversee this important project. That is why the pharaoh recognized that the dreams of Joseph of the coat of many colors indicated he could safely be put in charge of the Egyptian granaries (Judges 7:5, NIV). Similarly, another problem has consistently generated governmental planning and policy making: violent unrest between racial and ethnic divisions among the general population. Too often rank discrimination by majorities against minorities leads to cries of injustice and breeds cycles of protests and violence, often leading to a downward spiral that destabilizes larger communities. The need for local law enforcement leaders was an ongoing concern. Today, the millions of people living in multicultural civil societies rely upon cooperation among many different groups to establish substantial economic and social benefits, which are generally unavailable to the members of smaller clans and tribal groups.

Early in the twentieth century, public managers were academically trained in the basic principles of management, popularly using the acronym POSDCORB, standing for the tasks of planning, organizing, staffing, directing, coordinating, recording, and budgeting. The staffing and coordinating functions were the essence of personnel management and leadership. Little attention was made to the kinds of diversity issues that concern personnel leaders today. However, the old acronym is still useful, providing we add equity into the string of letters, to get POSDCORBE. This captures the twenty-first century's emphasis on discrimination and diversity policies. Later the personnel management function was centralized, and its activities were captured in the acronym "PADS" for planning, acquisition, development, and sanctions. New recruits were immediately classified according to their acquired academic knowledge levels, their acquired operational and managerial skills, and their innate abilities and potentials; the acronym KSA became a popular parlance in the field. Modern personnel leaders must include sensitivity to equity and diversity issues in their KSAs and plan for advances in these areas. The ideal now is having a human resource management (HRM) office, directed by an administrator who is a member and a leader within the upper levels of agency management. The chief personal officer (CPO) ideal directs specialists who in addition to their traditional and planning duties promote diversity ideals across the agency's structural organization and mission-oriented operations.

These specialists must be sensitive to the consequences of racial, social, and economic discrimination. There must be keen realization of how general shortages of resources and responses to threats stemming from the disparate distribution of them, especially, food and shelter, can frustrate the achievement of their particular missions. Too often discrimination against the angry "have-

nots" concentrated in ghettos and refugee camps spills out into the larger society. To forestall these problems, responsive commonwealths will attempt to enact and implement pro-diversity policies to dampen the unrest before it completely overwhelms the community. Although it has only been in the last century or two, with the spread of global literacy, that a plurality of ordinary people has developed this perspective, theorists and philosophers have considered these problems for centuries. It may not be too harsh to judge that they all failed. In part their efforts may have fallen short because they aimed for the establishment of permanently ideal communities, instead of settling for ongoing incremental change, accepting the enduring competitiveness of human nature. Modern capitalism has been shown itself capable of fostering growth and change, but inequities have not been eliminated, and new generations create new cultural values and conflicts. Perhaps efforts to provide justice and equality for all should be continuously rewoven into the social fabric, to sustain progressive synthesis. Many scholars believe the modern administrative state, with its enormous bureaucracy, is becoming the dominant form of government, even though they do not all support it. It remains to be seen whether contemporary reforms such as pro-business or state capitalism, the contracting out of services, functional privatization, or the proliferation of private nonprofit organizations will change that direction or will prove to be little more than cosmetic modifications. For all of them, the general rule in administration of any agency, regardless of its mission or management division, is that its leadership is basically external to the operating staff. In terms of governance, the control must be in the political sector, whether totalitarian or civil libertarian. Conversely, in the modern world, professional leaders are trained to ensure they know their personal responsibility to avoid complicity in discriminatory policies. The line between politics and administration may be permeable on occasion, but leadership theory has its origins in political, religious, and military theory.

Aristotle discussed equality theory in several of his works, including *The Politics* and the *Nicomachean Ethics*. Here, some interpreters indicate he used "equal" as akin to "fairness," indicating that political justice is proportionately based on ones just deserts or merit, and is a matter for citizens, those who are free and equal in their capacity as citizens (Ethics 11, 321–19). Some scholars point to the fact that then just as now, equality is a contested concept with different definitions to different people (Equality, Stanford). Other early Athenian philosophers theorized that all humans were equal because they could reason; unfortunately many of the city's citizens thought they still needed slaves to do the hard and dirty work in the fields and the silver mines, so the inequalities were not equitably addressed. Later, the Romans extended citizenship and equality under the law to many of those who helped in the process of expanding their civilization. It was granted to foreigners when they opened their gates to Roman armies and to merchants who adhered to Roman law and participated in desired commercial activity. The Romans brought the idea of multiculturalism to a historical high; but they also maintained institutional slavery as a large workforce which would release their commoners and elite classes from manual labor.

A notably important advance toward tolerance and diversity came when monotheistic religion spread the idea that all people belonged to one family, with brotherhood and equality under Divine Will. However, doctrinal schism and war between sects, and perhaps desire to punish those vilified as sinners, dovetailed into global beliefs in forcing slaves to do hard and dangerous work. So even the new religions generally stalled in fulfilling their promises of establishing universal equality and tolerance. Accordingly, it was not until the European Renaissance and the French Enlightenment adopted equality and fraternity ideals, and these could be implemented as the Industrial Revolution developed machinery to replace human slaves, that the inexorable economic paradigm of slavery was finally broken. In the sprawling European factories, and particularly in North America, where the labor shortage was especially acute, the new machines could do unpleasant and dangerous work quicker and cheaper than oppressed populations of forced laborers. Slavery was systemically obsolete at last. Simultaneously, new political theories of capitalism and socialism captured the attention of millions, and the old

political systems began to be replaced by constitutional legal systems with guarantees of equal rights for all. Nevertheless, other factors such as political rivalry and short-term economic advantage, and even instinctive primate competition for status and dependents, have supported pocket vestiges of discrimination all over the modern world.

Once diversity becomes an important political goal, the administration and implementation of diversity policies can begin, emphasizing requirements for equalities in more equitable living conditions and educational opportunities. Stronger policies require employment opportunity, not only in the private sector, but in public service as well. This transition is not easy; paths are generally opened up only for a few new participants, typically upwardly mobile individuals with valued skills. Setting criteria for personnel selection in the context of diversity implementation efforts and compromising multiple opposing opinions among evaluators will all impact the effectiveness of these new pro-diversity planning activities. Sometimes the intermediate result is to winnow down the number of successful applicants and beneficiaries. For instance, in one of the earliest known examples of military planning and training in literary and historical records, a leader was advised to take promising military recruits down to water and to separate them by how they drank. According to the most accepted version of the story, those who laid down and dunk their heads or lapped at the water were rejected; those who stayed alert and kept their heads up and cupped their hands to drink were accepted (Judges 7:5, NIV). Thousands of years later, scholars are still debating the planning rationales, techniques, and decisions of that legendary leadership decision, some copiers and revisionists even reversing the selection criteria (Bible Hub Commentaries). Just as any new advance in human resource training will generally spread and be adapted by other authorities, diversity policies are spreading around the postindustrial world.

Studying the complexities of management diversity theory and practice requires attention and understanding of concepts such as genetic expression, statistical distribution of characteristics, ethnocentric cultural myopia, social justice, pluralism, and ideology. Personal bias, group prejudices, and institutional discrimination have separate but interlocking relationships which need to be dealt with comprehensively before effective official diversity policies can be adopted by governmental and administrative authorities. The scope of the problem can hardly be overestimated. Just about every human characteristic can be and is targeted as the basis for some group's systematic bias and discrimination. Scholars have identified the "big eight" categories of discrimination, the foremost being race, especially in terms of skin color, eye structure, height, and weight (Plummer 2003).

Two other common types of discrimination involve age (bias toward either the young or the old) and gender (almost universal against girls and women). Arguments that gender discrimination is justified by the necessity for division of labor have been weakened by the invention of machines that reduce the importance of body strength, for example, enabling women to be truck drivers and airplane pilots. It is hard for even the most misogynist critics to deny that a female police officer with a gun can be as deadly to criminals as her male coworker. One occupation where gender characteristics still produces headaches for personnel offices is firefighter, where dislodging physical standards based on male stereotypes of size and strength is proving difficult. Human females are the majority of the world's population and represent the greatest challenge to diversity leadership.

Few readers will be able to ignore the fact that conflict between different creeds and religions is endemic through history. Other discrimination patterns include nationality qua ethnicity, mental and physical disability on the one hand, and on the other hand hostility toward *ableism* (see anti-elitism, anti-intellectualism). Antipathy based on class, organizational role/job function, and sexual orientation and identification is also well known. Other intolerant behaviors are in the process of emerging as patterns of discrimination to be addressed. These include generational or regional slang, allergies to traditional foods, and lifestyle habits such as smoking and other risk-taking behaviors.

In addition to promoting these singularly important egalitarian concerns, there are many other reasons for enacting diversity policies. Discrimination breeds interpersonal problems and social unrest: abusive superiors produce resentful subordinates who may react with workplace violence. This leads to losses of industrial productivity and economic declines. Traditional ethnic foods and medicines may be redefined as substance abuse violations under parochial and political oppression policies. In some societies eating the meat of cattle, canines, and pigs is valued, but in other societies, the same behaviors are condemned as unsanitary and sinful. Discrimination applies double standards on the wearing of traditional clothing, the justified use of force and violence, mortality beliefs, and other conceptions of morality.

## Modern Practices

Today most economically developed nations have developed pro-diversity policies to counter the negative effects of widespread discrimination. In many cases the discrimination is directed against marginal population groups, racial, and ethnic minorities. When general public perception becomes aware that many of these discriminatory patterns have negative impacts on economic development, the stage is set for regulatory reform. In other cases, citizens may realize that prevailing discrimination patterns are obsolete, remaining merely due to lingering traditional and cultural elements. The capture of Peruvian Emperor Atahuallpa at Cajamarca is attributed by Diamond as one of the significance consequences of epidemic diseases transmitted by Europeans to peoples lacking immunity. Pizarro anticipated and exploited the divisions dividing the Incas after a civil war precipitated by those diseases (Diamond 1999). Worse, they may be perpetuated by deliberate attempts by special interest groups to maintain an unfair advantage over the weak and helpless. In these cases, responsive governments may pursue new diversity policies to level the economic playing fields for overall social benefit and improvement of the gross national product. The European Age of Exploration and Colonialization in the new world by Spain, the United Kingdom, and France is a well-known example of old selfish policies that are now being reversed and redressed by reparations and the enactment of pro-diversity policies.

Significantly, modern nations are combining their diversity policy efforts to create international organizations. One of the first of these, sponsored largely by the United Kingdom, was the establishment of the International Olympic Games Committee, to copy and revive the cohesion building of Greek Olympic Games at Delphi. Another, and perhaps just as important, is the United Nations (UN), the current manifestation of attempts to create a functioning world government. One of UN's most important agencies is UNESCO. The United Nations Educational, Scientific and Cultural Organization (UNESCO) is a specialized agency of the UN and, appropriately enough because of its dedication to enlightened progressive philosophy, is based in Paris, France, where the enlightenment flowered and helped to trigger the democratic revolutionary era. One of its most important duties involves furthering diversity goals. In the nuclear age, it has become distressingly obvious that perceptions of human oppression, real or overzealous, and violent reactions to them and to other discriminatory policies threaten the welfare, if not the survival, of our entire species.

Historically, inclusive multinational (city-states) efforts to recognize the utility of diversity efforts to maintain peace and cohesion go back to the ancient Greeks and their Olympic Games. The dozens of Greek city-states, some representing large-scale experimentations in ideology such as Athens and Sparta, routinely resorted to war to resolve differences among them. Greek mythology claimed the gods on Mt. Olympus decreed periodic amnesties and truces when athletes from all over the Greek cultural and linguistic sphere, representing every region, island, and city, could come together to renew their bonds of fellowship. The games were intended to promote their common religion and culture and to improve better trade and economic relations among them. It aimed at maintaining and strengthening their common heritage and commonalities of interests.

Fostering athletic competition emphasized shared physical traits and cultural ideals. It conceivably contributed to the peninsula's ability to resist Persian conquest. Today, the modern revival of the Olympic Games aims at performing the same function for the world's hundreds of nation-states. The quadrennial athletic competitions show that people representing even isolated tribes, nationalities, and cultures can coexist and benefit from peaceful interaction. Physical characteristics that may play prominently in bias and discrimination are shown to be trivial compared to the common aspirations of all people and the overriding similarities of the basic human anatomy. It is hard to maintain stereotypical beliefs about the inhumanity of traditional enemies when you have lived and broken bread together.

In 1896, cosponsored by the United Kingdom and the Kingdom of Greece, athletes from 14 counties met in the first modern Olympic Games in Athens. Similar organizations began to spring up all around the world. In America, shortly after John F. Kennedy (member of a religious minority) was elected president, one of his sisters, Eunice Shriver, became involved in creating the Special Olympics, an organization dedicated to improving treatment for people with mental disease and retardation. Its first events were held on private property, in the backyard of a family home in Maryland. In July 1968, families from Canada and the United States opened the first International Special Olympics at Soldier Field in Chicago, Illinois (Special Olympics). Today it is a global organization with programs in a 170 countries. Perhaps encouraged by this and other efforts, in 1984, the International Olympic Games Committee met for the first time and formalized the present popular spectacles, alternating between summer and winter games rotated among various host countries in a highly competitive process. The winners expect substantial economic benefits by showcasing their products and skilled technicians to the global economy.

The United Nations has similar origins and ideals. It was also created in times of tribal animosities and war and was designed to promote peace among nations. Since war is a predicable result of reaction to perceived hostilities and prejudices, a major purpose of the United Nations is to encourage peaceful means of resolving disputes. In 2002, soon after the 9/11 attack on the World Trade Center in New York City, UNESCO published its definitive statement on the need for a global diversity policy. The Universal Declaration on Cultural Diversity was adopted unanimously by all members, representing peoples around the world. The Declaration embodies two major goals: the first aims to preserve cultural diversity as a living, thus a renewable treasure that must not be perceived as being just an unchanging heritage but as a process guaranteeing the survival of humanity. Secondly, the Universal Declaration aims to prevent legal segregation and fundamentalism which, in the name of cultural differences, would sanctify those differences and so counter the message of the Universal Declaration of Human Rights.

The Universal Declaration makes it clear each individual must acknowledge not only otherness in all its forms but also the plurality of his or her own identity, within societies that are themselves plural. Only in this way can cultural diversity be preserved as an adaptive process and as a capacity for expression, creation, and innovation. The debate between those countries which would like to defend cultural goods and services "which, as vectors of identity, values, and meaning, must not be treated as mere commodities or consumer goods" and those which would hope to promote cultural rights has thus been surpassed, with the two approaches brought together by the Declaration, which has highlighted the causal link uniting two complementary attitudes. One cannot exist without the other (Matsuura 2017).

Smaller civil rights-oriented organizations have sprung up around the world. For example, the International Movement Against All Forms of Discrimination and Racism (IMADR) was created in Japan in 1988. Originated by the Buraku minority, it has grown into an international nonprofit organization based in Japan and Geneva, devoted to eliminating discrimination and racism. IMADR is in a consultative relationship with the United Nations Economic and Social Council (ECOSOC). The International Movement

publishes newsletters concerning the activities of the United Nations Committee on the Elimination of Racial Discrimination (UNCERD). A sample CERD newsletter to interested NPOs solicited information about countries soon to be addressed by the UN Committee (CERD, 09-28-16). These organizational linkages reflect not only the increasingly transparent nature of the World Wide Web but also the networking skills of a new generation of diversity administrators.

## Diversity Contradictions

As described above, leadership in diversity issues can be described as a two-pronged and sometimes opposing effort. On the one hand, inclusive diversity leadership seeks to dampen the dysfunctional effects of discrimination that might someday threaten world stability. To a certain extent, this implies integration of all people into a global homogenized unity. On the other hand, another group of diversity leaders want to preserve diversity in all its forms as a living, and thus renewable treasure, by excluding some facets of minority heritage from incorporation and submersion inside the global village. A compromise view suggests that preserving separate ethnic identities need not be perceived as being a set of static and unchanging heritages, but as a dynamic process helping to guarantee the survival of humanity's mental and spiritual diversity.

On the other hand, many diversity leaders are deeply invested in strengthening identity politics, involved in protecting their groups from assimilation and submersion. Partly in order to pursue this goal, and partly to highlight the uniqueness, worth, and utility of the world's scattered minority groups, they are banding together in common cause. They may possess a variety of racial physiotypes and an even larger variety of folk costumes, but they can work together to avoid cultural submersion in the emerging global village. In 2015, the first Indigenous Games were held in Brazil, in advance of the Summer Olympic Games scheduled for 2016 in the same country. From the Amazon to the shores of New Zealand, 2000 competitors converged on the Brazilian Frontier city of Palmas for the first World Indigenous Games. "We're distant from other cultures of the world, but this gives us a chance to mingle with other indigenous people from all over the place, said one athlete" (Darlington 2015).

## Leadership Commonalities

While there is a plethora of leadership types described in the academic literature and trade magazines, three basic personality types can be articulated as they affect diversity activities. They are conservative status quo and pattern-maintaining types, transformational leaders, and pragmatic contingency operators. The status quo types of leaders tend to be traditional democratic or laissez-faire leaders, resistant to sudden change, with a tendency to use rational and legalistic methodologies. Transformational types tend to have charismatic and authoritarian personalities and are oriented to leadership primacy. The third group can be described as contingency oriented, recognizing the inevitability of changes, assessing situations before they act, and possessing high levels of adaptability. Whichever type of leadership dominates any particular organization, the best practice motto for any supervisor is likely to be: mission first, people always.

Socialization and educational practices tend to mold leaders into the status quo leadership styles appropriate to the dominant culture. Mainstream diversity leaders, geared to assimilating minorities and dissonant perspectives into the larger community, generally desire to maintain the structure and operations of the larger group. They often practice the political philosophy of Edmund Burke, reconciling representing their constituents while retaining their own judgment and a belief in the wisdom of prior generations. Interestingly, these types of leaders can be found in both the larger dominant culture and in the smaller minority communities. This commonality of style and methodology can be seen in both the Olympic and Indigenous athletic games and bodes well for continued cooperation between the two groups.

Transformational leaders are psychologically distinct and divided into two distinct categories:

one oriented to individual leadership primacy, guiding their followers forward toward their visionary goals. They are energetic entrepreneurs, champions of their cause, and broad-based social innovators. The other type of transformational leader is similarly self-oriented and pushes for change but focuses on small-scale iterative development. These leaders itemize problem-solving and desire evolutionary changes in an organization's significant facts and routines but are also interested in "stabilizing the container" while transforming the contents (Ecology 2016).

Contingency-oriented leaders are more pragmatic, reconciled to the inevitability of change, assess situations before they act, and are highly adaptable in adjusting to the new environments they find themselves in. They listen to and trust the advice of their subordinates. Contingency leadership is suited to exploring the environment and expecting change to occur. It keeps the mission in mind, but is not committed to habitual maintenance of traditional structures, and tends to listen to and trust subordinates. It has a pragmatic action orientation. One good operational diversity textbook is D. L. Plummer's (2003) *Handbook of Diversity Management*: *Beyond Awareness to Competency Based Learning*. This business-oriented text focuses on how management consultants can build a good diversity policy on a marketing strategy, return on investment (ROI), to broaden its customer base and increase its bottom line. It also has good articles on building and maintaining diversity awareness within an organization. All of these are useful in a public agency context.

In training and development classes, these topics should be supplemented by material on public policies such as equality theory, affirmative action, and equal employment opportunity. It is important to avoid the highly partisan tone of many diversity courses, where some countries may be portrayed as particularly vicious examples of discriminatory behaviors. Both the United States and Russia, for example, have such reputations in some quarters; but both experienced terrible civil wars to establish more tolerant societies. An overview of diversity from a global perspective is not only the best objective approach, but the most accurate. Of course, it may be useful to describe some of the rationales behind some fundamentally unjust discriminatory policies, in order to better confront and overturn them. First on the list are those policies which inadvertently or intentionally are designed to result in genocide.

The Story of Ishi is instructive in that regard. In California in the summer of 1911, a starving Native American walked out of the coastal mountains and became an instant journalistic and anthropological sensation. Ishi thought he was the last member of his race, and investigation indicated that he was indeed the last living member of a remnant band of an Indian tribe known as the Yahi people. He was starving because he had been deprived of support and companionship when his older remaining close family had all died, hastened at least in part because a group of hikers had stumbled on his camp and carted off or destroyed many of the tools necessary for Indians' survival (Rockafellar, 02-15-17). Anthropologists at the time were just beginning to collect ethnic oral histories, and Ishi was a wellspring of information. As their ward at the University of California, he good-naturedly demonstrated many of his skills as a toolmaker and a hunter to hundreds of tourists and students every weekend. He was billed as an example of the noble savage and a true gentleman. He died in 1916 of advanced tuberculosis. Under the auspices of the American Indian Act of 1989, his remains were claimed by the approximately 400 remaining Yahi people, themselves grouped within the 1500 members of Yana people. All over the world, tribes are disappearing, sometimes assimilated bit by bit into the surrounding national population, sometimes vanishing completely. When they go, their histories, tool kits, and biological adaptations vanish with them. Organizations such as the National Geographic Society may sometimes catch glimpses of their unique genetic characteristics, but the rest are gone.

## Summary

The core essence of emerging global diversity policy is to alleviate and prevent conflict and war generated by resentment and reaction to intolerable discrimination. Discrimination cannot be

totally eliminated, because all identifiable populations take pride in their unique histories and achievements and resist attempts to destroy them in overzealous striving for complete assimilation. Conversely, human beings also copy and learn from each other and will join together in coalitions to protect themselves from common dangers. The world's leaders and their supporters must plan ways to reconcile these countervailing tendencies. Convincing arguments are made that almost as critical to the survival of modern civilization is the duty to maintain all of the unexplored resources inherent in the global population. This includes the unknown potentialities of the human genome, all cultural and spiritual arts, and the complete tool kits different societies have developed to cope with their unique environmental challenges. The role of leadership in this effort is to plan and implement diversity policies to achieve these goals.

# Platforms and Public Administration

Felipe Zarpelon, Vinicius Antonio Machado Nardi and Jorge Verschoore
Unisinos University,
Porto Alegre, RS, Brazil

## Synonyms

Crowdsourcing; e-Participation; Public participation; Two-sided markets

## Definition

Platforms refer to the strategy to connect consumers (citizenships) and developers (government) interested in the outcomes of network interactions.

## Introduction

In business administration, the strategic use of business management platforms is recurrent. Magazines are used to connect businesses – through their advertisers – with readers. Trade shows have established themselves around the globe through this same model, serving as the basis for the link between consumers and sellers. With the advancement of technology, companies like Facebook, Google, Alibaba, Uber, and Airbnb used the same format to become leaders in their business segments. The success of this format was then used in public administration,

mainly to stimulate social participation and legitimization of governments.

In principle, the adoption of public service platforms has characteristics similar to those of the private market. However, a differential is the motivation of users. While in private initiative the economic purpose supports most actions, the return on public platforms is fundamentally social. The purpose of this entry is to provide an overview of the role of platforms and its adoption in the public domain. It begins with an analysis of theoretical perspective and the managerial consequences of its use. Finally, it concludes with an approach of what is known about platforms in public administration.

## Theoretical Perspectives

The platform is a transformative but straightforward concept that has affected businesses, the economy, and even society (Parker et al. 2016). Traditional sectors such as hosting, transportation, and retail have undergone significant changes following the introduction of platform-based business models (Kohler 2015; Libert et al. 2014). Parker et al. (2016) argue that eventually all industries will be affected by business platforms, given the value produced by collaborative work through social networks. Contemporary networks enhance the ability to create value through fast and spread connection of distant actors with complementary resources.

What makes the platform model successful is the ability to connect people, organizations, and resources in an interactive environment in which value propositions are created and exchanged (Parker et al. 2016). Information and communication technologies (ICT) play an essential role in platform business models as they allow reaching the necessary scale to sustain network externalities. Besides the access to distinct actors and resources, ICT enhance the necessary breadth for businesses to develop rapidly and become successful players in traditional markets (i.e., private transportation, hosting, etc.) or even create new markets (Hagiu and Rothman 2016).

Platform business models connect knowledge and talent spread into the crowd to predict opportunities and create solutions. ICT as powerful data processers should be able to organize and filter the amount of information arising from interactions of complementary actors. As an outcome, resources are effectively connected to opportunities, and solutions arise (Brabham 2013).

In general, four main players comprise the platform ecosystem: owners, providers, producers, and consumers (Parker et al. 2016). Owners are responsible for controlling intellectual property and defining governance for interactions among users. Providers usually stand for technological solutions as an interface among users, processing data, and supplying information. The group of users is composed by producers and consumers, each sustaining their positions according to each transaction.

The platform becomes active as a business when it generates a value perceived by both connected parts through its primary assets, which are the information and the interactions it makes possible (Evans and Schmalensee 2010). Because they are connecting people, platforms benefit from network externalities (Katz and Shapiro 1985), that is, the product or service utility increases as the number of consumers and creators involved increases. Parker et al. (2016) refer to these externalities as an essential part of the platform architecture and go beyond, stating that not only benefits are observed with increasing numbers of users in a platform. The authors identify negative effects of the network, mainly when an indiscriminate increase in the number of users on a poorly managed platform can reduce the value produced for each user. Then, the perfect fit of managerial structures and set of users sustain the value creation in platforms.

## Managing Platforms

Kohler (2015) identifies three models of platform operation as the best architecture for business purposes. These models are defined by how stakeholders are connected, business objectives, and structures of power and control: (a) two-sided or multiple-sided platforms, (b) product platforms, and (c) integrating platforms.

In two-sided markets, the users connect and interact directly inside the platform environment. The two-sided connection is a feature not only of platform strategies but of markets with network externalities. Platforms managed under this model connect groups with distinct and complementary objectives (Eisenmann et al. 2006; Rysman 2009).

The dynamics of product platforms undersees the development of products or services by users on a base technology. In a second step, these developers sell their solutions to connected consumers. Similarly to two-sided models, product platforms promote the matching of complementary objectives, but here the control and direction of the platform owner are accentuated. The owner has the technology on which the product or service is developed by its creators (Kohler 2015).

The main characteristic of the integrative platform is an environment where contributions are captured and sold to consumers. The creation is a core activity here, performed mainly through competitions. This operation also presents a variation, commonly known as collaborative communities, whose main objective is to gather a series of contributions from the crowd into an original set of value (Kohler 2015).

These different platform configurations can be successful in their applications through strategies where the focus is on orchestrating resources and optimizing internal processes to facilitate external interactions, generate customer value, and maximize the value of the ecosystem (Boudreau and Lakhani 2009; Van Alstyne et al. 2016).

The platforms traditionally focused on private initiatives were adopted by the public with the power to respond to the demands of increasingly participatory individuals, called Citizens 2.0, and to legitimize their actions toward society (Brabham 2008, 2009; Hilgers and Ihl 2010; Linders 2012; Seltzer and Mahmoudi 2013). These initiatives are based on the belief that citizens with experience, situational awareness and interest in participating are potential sources of solutions for governments pressured to do more with less (Royo and Yetano 2015). In recent years, driven by technological advances, availability of information, and social mobilization, this development has become widespread (Thomas and Streib 2005).

## Platforms in Public Administration

Traditionally focused on private enterprise, the adoption of platforms as a public management strategy has been recurring in the last decade. Technological advances, the growth of social activism (Nalbandian et al. 2013), and the concern to expand participation mechanisms have made the adoption of platforms – especially electronic ones – increasingly large. Pressed to do more with less, governments came to use platforms as tools to legitimize their actions, to understand the demands of society, and to find potential solutions to social problems, since citizens directly involved with the situation would have the experience to suggest interventions (Brown et al. 2017).

The public service management strategies based on platforms have the motivation as their differential. While in the business environment economic purposes are the rule, in public management the return is fundamentally social. Cases such as the Brazilian government's "Ideia Legislativa" platform (Nardi et al. 2018) illustrate this reality. In the concrete initiative, citizens can suggest through the platform changes in the current legislation and mobilize their network of contacts to raise support. These ideas are then brought to the discussion and, if approved, implemented in society.

At the same time that it brings the public administration closer to society, the use of platforms expands the process of direct democracy (Royo and Yetano 2015) and facilitates the solution of social problems. The use of social media technologies and the implementation of open government initiatives encourage the participation of society in the political process, giving legitimacy to public actions and making more effective solutions to complex problems. The use of platforms, for example, enabled matchmaking systems to be implemented to overcome management failures, as in the case of access to the American education system (Roth 2015).

## Conclusion

Increasingly, organizations around the world use platforms as a business strategy. To date, however, little has been explored on the topic in the literature. The use of platforms as tools for public management, although still an embryonic stage, has aroused the interest of managers for their ease to fastly connect a broad part of the population. Although the similarities between the public and private use of platforms are recognized, a point of differentiation is the outcome generated for users. While in the private initiative the motivation is economic, in the public administration the return is inherently social.

The adoption of public management platforms emphasizes citizens' engagement and their direct participation in the political process. At the same time as it brings benefits to the citizen, the results for the government that can use the tool as a source of identification of social problems and solutions increase their relations with society, strengthen citizen confidence in public management, and, finally, legitimize their actions. Serving as a mediator between government and society, a platform is a resource-rich tool for implementing innovative practices that enable governments to do more with less. The understanding of the platform strategy still lacks advances in the literature, especially the architectures to be used in each case to reach the best possible results.

# Police Use of Force and Community Policing During a Pandemic

De Lacy D. Davis
Family Support Organization of Union County, Plainfield, NJ, USA

## Synonyms

Broken windows policing; Community-oriented policing; Hot-spot policing; Problem-solving policing; Quality of life policing

## Definitions

Use of force – amount of effort required by police to compel compliance by an unwilling subject (International Association of Chiefs of Police 2001).

Community policing – a philosophy that promotes organizational strategies that support the systematic use of partnerships and problem-solving techniques to proactively address the immediate conditions that give rise to public safety issues such as crime, social disorder, and fear of crime (DOJ 2004).

## Introduction

This entry focuses on the issue of police use of force and community policing during a pandemic by highlighting the following in subsequent sections: varying perspectives; public fear of the police; broken windows theory; community policing challenges; use of force; standpoint theory; solutions; and a conclusion. Law enforcement practitioners, elected officials, police officers, nongovernmental organizational leaders, clergy leaders, and other community stakeholders continue to call for unity in communities – especially after community/police violence erupts. When community/police violence results in the death of a police officer, very often, the police union representative holds a press conference, talks about the heinous nature of the crime against a public servant, and demands justice. Elected officials and other community stakeholders take similar positions. When the community/police violence results in the death of a Black person, the police practitioner has a preprogrammed response based on the evidence of similar community/police encounters in the past.

Former Minneapolis Police Chief, Anthony Bouza, stated in an interview with a reporter that in most urban centers in the United States, when a police chief is called "at three in the morning and told, 'Chief, one of our cops just shot a kid,' the chief's first questions are: 'What color is the cop? What color is the kid?'" (James et al. 2014, p. 337). He further explained to the reporter, "if the answer is, 'The cop is White, the kid is Black,' he gets dressed" (p. 337). It is these conflicting perspectives of the police as the aggressor and the community as the victim, or the community as the aggressor and the police as the victim, that do not permit participants in one group or the other to extend their viewpoints beyond their comfort zone.

## It's a Matter of Perspective

On February 8, 2020, and February 9, 2020, within a 12-hour timespan, two New York City police officers were ambushed and shot by an alleged Black male suspect. Many New York City residents wrestled with trying to understand what could lead someone to attack the police who were there to protect and serve the community. Other members of New York City's fragile communities struggled to understand how and why police officers, who had continued to shoot unarmed Black men, like Laquan McDonald (Chicago, Il) or Stephon Clark (Sacramento, CA), would not expect this outcome? This dichotomy reflects the challenge of law enforcement in the twenty-first century. Police executives must learn to effectively develop policies and constitutional policing practices that are not in conflict with the public's perceptions and realities of policing in marginalized communities.

A recent study, "Police Use of Force: Examining the Factors Relating to Police Officers Shooting Unarmed Black Males," Davis (2019) suggested that police officers are implicitly biased, but that bias is not always reflected in their behavior with unarmed Black males. President Barack Obama's Task Force on twenty-first Century Policing found that building trust and legitimacy were the foundations for effective policing (Peyton et al. 2019). If police departments are to achieve their missions, police leaders will have to overcome the barriers of distrust and illegitimacy.

Today the police profession is challenged by allegations of racial bias in police practices in poor, urban, and marginalized communities. Community policing, a partnership between residents in the community and the local police department, is a strategy used by police organizations to solve problems, reduce the fear of crime, and reduce social disorder in a community. The coproduction of policing with the community is a vital part of community policing (Williams et al. 2016). Police organizations depend on the community members to come forward to monitor, as witnesses, the comings and goings of individuals in their communities through crime watch and block watch associations and to coproduce policing through volunteerism, which reduces costs for police departments and the community (Davis 2019).

## Public Fear of the Police: Justified or Unjustified?

Police executives must learn to manage police practices with the understanding that residents in some communities are fearful of the police. This fear reduces the effectiveness of a community policing strategy. Between January and March 2020, the United States responded to an outbreak of the novel coronavirus disease of 2019 (COVID-19). Several northeastern states executed Stay-at-Home Executive Orders (Commonwealth of Pennsylvania 2020; State of Connecticut 2020; State of New Jersey 2020). Communities that have not always had positive interactions with the police were faced with the emotional challenge of how to interact with their local police departments. Some residents questioned, "If there is a need to call the police, will the police response be measured and consistent with the community's expectation, or will the encounter end in confrontation and death? And if death, will it be of the residents or of the police officers?"

Recently, a White New York City Police Department (NYPD) officer was videotaped violently taking a Black male to the ground and physically assaulting him for failure to socially distance, remain 6 feet or more away, from another non-family member in public. The Black male was sitting outside of an East Village, New York, deli talking with a female. The encounter resulted in the arrest of the male and the female and allegations of excessive force (Pereira 2020). The videotape went viral. It is a reminder of the conflict between America's police department and the Black and Brown communities. In a Manhattan, New York City park, White citizens could be observed sunbathing and enjoying the park, while police officers handed out facemasks. The sunbathers, who were in violation of Governor Andrew Cuomo's Executive Order 202, Declaring a Disaster Emergency in the State of New York, were not arrested or summonsed as those in other neighborhoods in New York City.

NYPD, like many police departments across the United States, has implemented many community/policing initiatives. The concept of community policing is based on community partnership, organizational transformation, and problem-solving. Police leaders will have to understand how these components interrelate, overlap, and where there is a need for improvement. Criminology theorists, James Kelling and George Wilson (1982), based on social disorder, prepared the foundations for police/community problem-solving with a study of social disorder.

## Broken Windows Concept

In 1982, Kelling and Wilson argued that social disorder and incivility leads to crime. Their

broken windows theory, which was postulated by the criminologists, became the hallmark of NYPD's encounters with its citizenry called "stop, question and frisk" or "stop and frisk." This theoretical argument would become the foundation of police policies and encounters with citizens across the United States. Most recently, former New York City Mayor Michael Bloomberg, a 2020 presidential candidate, apologized for "stop and frisk" (NBC News 2016).

Bloomberg maintained that he should have acknowledged the adverse impact that the practice had on Black and Brown communities. Mayor Bloomberg's admission, 25 years later, reinforces the claims of members of fragile communities that police officers are biased, and it erodes trust (NBC News 2016). Effectively communicating the failures of "broken windows policing," stop-and-frisk policing, or zero-tolerance policing is the first step to improving community/police relationships.

Terry v. State of Ohio (1968) has been the foundation for police officers stopping and patting down citizens for weapons when they have an encounter on the street. In this case, the Court reasoned that one should not reasonably expect a police officer on the street to secure a warrant for a search and seizure when on-the-spot observations must be made quickly.

In the US Supreme Court case, Terry v. State of Ohio (1968), the Court held that a police officer could stop and frisk a suspect, if that police officer reasonably suspected that a crime had been committed or was about to be committed. The Court held that a police officer could reasonably believe that a suspect is armed and dangerous. The Court decision permits a police officer to frisk (pat down) a suspect's outer garments for weapons for the officer's protection, also named a "Terry stop."

In a class action lawsuit filed against the NYPD (Floyd v. City of New York 2013), Judge Shira A. Scheindlin illustrated the challenges that law enforcement leaders across the United States must address in their efforts to protect and serve the community. The judge found NYPD's stop-and-frisk practices unconstitutional, racially discriminatory, and a violation of New Yorker's rights to be free from unreasonable search and seizure. The decision of Judge Shira Scheindlin in *Floyd v. City of New York* (2013) highlighted the challenge of the stop-and-frisk policy:

- Between January 2004 and June 2012, the NYPD conducted over 4.4 million *Terry* stops.
- The number of stops per year rose sharply from 314,000 in 2004 to a high of 686,000 in 2011.
- 52% of all stops were followed by a protective frisk for weapons. A weapon was found in 1.5% of these frisks. In other words, in 98.5% of the 2.3 million frisks, no weapon was found.
- 8% of all stops led to a search into the stopped person's clothing, ostensibly based on the officer feeling an object during the frisk that he suspected to be a weapon or immediately perceived to be contraband other than a weapon. In 9% of these searches, the felt object was in fact a weapon. 91% of the time, it was not. In 14% of these searches, the felt object was in fact contraband. 86% of the time it was not.
- 6% of all stops resulted in an arrest, and 6% resulted in a summons. The remaining 88% of the 4.4 million stops resulted in no further law enforcement action.
- In 52% of the 4.4 million stops, the person stopped was Black; in 31% the stops, the person was Hispanic; and, in 10% of the stops, the person was White.
- In 2010, New York City's resident population was roughly 23% Black, 29% Hispanic, and 33% White.
- In 23% of the stops with Black people, and 24% of the stops with Hispanic people, the officer recorded using force. The number for Whites was 17%.
- Weapons were seized in 1.0% of the stops with Black people, 1.1% of the stops with Hispanic people, and 1.4% of the stops with White people.
- Contraband, other than weapons, was seized in 1.8% of the stops of Black people, 1.7% of the stops with Hispanic people, and 2.3% of the stops with White people.
- Between 2004 and 2009, the percentage of stops where the officer failed to state a specific suspected crime rose from 1% to 36% (p. 73).

Similar conflicts between law enforcement and residents, based on stop and frisk were found in Baltimore, Maryland, where Freddie Gray, a 25-year-old Black male, died while in police custody. The death of Gray was from a spinal cord injury that occurred while he was being transported in an unsecured police van, which led to the indictment of six Baltimore City police officers. The first three police officers to face trial were found not guilty at a bench trial, which is a trial with a judge hearing and ruling on the case. Afterward, State's Attorney Marilyn Mosby dropped the charges against the remaining police officers arguing that the Baltimore City Police Department had worked against her investigation in the Gray case that prevented her office from gathering substantial evidence for a conviction. Mosby maintained that without real criminal justice system reforms, she could try cases like this 100 times and get the same end result (Stolberg and Bidgood 2016).

These type of cases in Black and Brown communities are viewed as disparities that have had an adverse impact on community/police relations. Community partnerships become difficult to establish with organizations and individuals, the problem-solving efforts by police departments are not perceived as being fair by community stakeholders, and the potential for conflict is increased (Reicher and Stott 2020).

## Community Policing Challenges

Community policing is defined by the US Department of Justice (DOJ) as "a philosophy that promotes organizational strategies that support the systemic use of partnership and problem-solving techniques to proactively address the immediate conditions that give rise to public safety issues such as crime, social disorder, and fear of crime" (DOJ 2014, p. 1.).

New Jersey Governor Phil Murphy (2020), in light of the COVID-19 activity, directed police officers to enforce the stay-at-home order in the New Jersey cities of Newark, Jersey City, and Lakewood and the Jersey Shore area. The relationship between the community and the police can determine the level of cooperation that responding police officers receive from the public. For example, a citizen on the boardwalk at the Jersey Shore, where encounters between the police and the community are generally cooperative, expressed that unless the police asked him to leave, he was not going to leave the boardwalk because he paid his taxes for the use of it (Franklin and Hawk 2020). Conversely, in other communities where the encounters between the police and the community have not been as cooperative, citizens continued to ignore the Centers for Disease Control (CDC 2020) social distancing recommendations of 6 feet of space between individuals.

Newark, New Jersey Mayor Ras Baraka (2020) responded to a community street party and appealed to residents to disperse and go home. They did disperse. On April 1, 2020, the four urban communities in New Jersey, Newark, Irvington, Orange, and East Orange, implemented strict social distancing orders. Roadblocks bordering each city were maintained by joint police department patrols. Residents were told via Facebook Live, the print media, and television news that they should stay home in their respective cities. Failure to comply with the orders would result in city tickets for first-time offenders, which could result in fines and possibly jail time. Subsequent offenses would be subject to prosecution by the Essex County Prosecutor's Office. Conversely, in Lakewood, New Jersey, a suburban community, there were several house parties, weddings, or celebrations that were broken up by police with the hosts and some participants being arrested (Attrino 2020). While arrests were eventually made in Lakewood, New Jersey, the police practices in the urban communities during the same time were more restrictive on individuals and groups.

The challenge for public administrators is to safeguard communities by effectively using police personnel while understanding that the quarantine will eventually be lifted. The police/community relationships will be judged by the police department's history and its recent behavior

with the community during the pandemic period. Mayor Ras Baraka in Newark, New Jersey, communicated the strict lockdown policy the night before the announcement on Facebook Live. During the morning of April 1, 2020, police caravans, with lights and sirens activated, drove through the city announcing the lockdown and directing residents to return home (Baraka 2020).

There are many policy questions that this practice raises. What other options were used to communicate this strategy to the public? To whom were the police officers making the announcements? What was done to reduce the fear that the citizenry may feel from hours of police officers driving up and down their main streets? Could a door-to-door campaign by police officers who were known to the community have been more effective? How did residents without access to technology find out about the lockdown?

Dr. Alie Terrell-Bryant, a resident in Newark, New Jersey, expressed in a Facebook post on April 2, 2020:

> I would feel far more at ease with a police visit on the porch to maintain social distancing. It is VERY disconcerting to hear sirens going off for extended periods of time during the day. Part of me is expecting law enforcement to remove us from our homes like in Nazi Germany. It is quite disturbing and downright frightening to see police caravans and to hear sirens repeatedly throughout the day. We are already terrified of COVID-19, and this just heightens our fear. (line no. 716)

Community policing is based on trust between the community and the police. The implementation of draconian police tactics reduces the opportunity for residents to have meaningful engagements with police officers in their community. Public administrators in city government and law enforcement must begin to plant the seeds of cooperation long before the need to implement a lockdown or quarantine a community. Both strategies can be isolating, intimidating, and significantly damaging to long-term community/police relationships.

Traditional stakeholders in communities, like the leaders of houses of worship, schools, businesses, and block/tenant associations, build meaningful throughway relationships between police departments and the respective constituencies that those stakeholders serve. The success of these partnerships is based on the community's level of trust in the stakeholders and the police department (Williams et al. 2016). Dr. Terrell-Bryant's (2020) perspective reflects a breakdown in communication that adversely impacts these relationships and the overall health of the community.

## Use of Force

Law enforcement practitioners who plan to lead police agencies in the twenty-first century must examine the historical relationship between police departments and the people of the United States and fragile communities. The police leader practitioner should examine the relationships, complaints, and concerns between Black and Brown communities relative to police department practices, policies, and dispositions. These relationships have been contentious since the slave patrols (Scott 2002). Police officers were used for the enforcement of slave codes, Jim Crow laws, and segregation. These practices, in more recent history, have contributed to the mass incarceration of Black and Brown people.

High-profile deaths of Black males at the hands of police officers, like Michael Brown, Eric Garner, Sean Bell, Jonathan Ferrell, Oscar Grant, Kimani Gray, Ramarley Graham, and Amadou Diallo, have helped to deteriorate the public's trust of police officers. The gains of years of community policing can disappear in minutes. On April 12, 2015, when Freddie Gray, Jr., died in the back of a van in police custody, the city was forced to address the issues of race, class, power, and privilege (Carpenter 2015).

## Standpoint Theory

Police practitioners will find the community's perception of the police to be one of the most challenging barriers to overcome. If the community perceives that there is a problem with the

police – there is a problem with the police (Woodson 1986). It is this perspective or standpoint that should inform police public policy. Georg Hegel (1770–1831) examined the relationship between the oppressor and the oppressed in the study of the master and slave using standpoint theory. The police officer's worldview may be experienced through a lens of the oppressor or the oppressed depending on the power and who has it (Rolin 2009).

Power allows individuals or groups to limit the options of other individuals or groups. Standpoint theory explains the opposing perspectives of police encounters with marginalized communities, in general, and Black and Brown communities, in particular. Some communities of color maintain that police officers are viewed through the lens of being the oppressors or "occupiers."

The recent COVID-19 pandemic has illustrated this conflict between the police and Black and Brown communities. It is against this backdrop that police officers must seek to engage citizens who may not have had a positive relationship with law enforcement. A recent study from researchers at Rutgers University-Newark, Yale University, and Massachusetts Institute of Technology entitled "A Field Experiment on Community Policing and Police Legitimacy" suggests that positive, nonenforcement contact between a uniformed police officer and members of the community has a significantly positive effect on the attitudes and perceptions of the police by the community (Peyton et al. 2019). This positive effect was particularly significant with minority community members whose baseline surveys indicated that they held negative attitudes about the police.

Social distancing, a healthcare strategy, is one of the approaches adopted by governments seeking to reduce the impact of COVID-19. The policy that is being enforced by law enforcement personnel can be subjective and selectively enforced by police officers. Research suggests that the no enforcement approach has a positive effect in minority communities regarding community cooperation and compliance (Peyton et al. 2019).

The CDC recommends social distancing as one of the strategies to combat COVID-19. This practice requires that citizens in public maintain a distance of at least 6 feet from one another to reduce the chance of the community spread of the virus. The police enforcement of this requirement varies from city to city. In the Bronx, like in Manhattan, police officers were observed distributing facemasks and gloves to White citizens sunbathing in the park in violation of the CDC's social distancing guidance. In other communities with large Black and Brown citizens, news networks reported scenes of police officers pinning a Black male to the ground with an officer's knee on his head for failure to wear a facemask and to practice social distance (Pereira 2020).

These contrasting police responses to the same social distancing guidelines lead to challenges for police leaders and public officials. Community policing tenets are not realized when police practices are perceived to be uneven or disparate. The trust between the police and the disparate communities is diminished because the partnerships between the individual or the organizations in the aggrieved communities are pressured to find a solution to the deferential responses (DOJ 2014). If some citizens are unfairly disadvantaged while others are unfairly advantaged, it reinforces the concept of systemic racism as a social determinant of equity, which adversely impacts all communities (Jones 2020).

## A Hopeful Solution

Violence against unarmed citizens in the United States has led to distrust of the police, questions about the legitimacy of the police, and the increased fear of police in minority communities. There is evidence that suggests that community police interactions with a uniformed police officer as a non-law-enforcement strategy can lead to improved attitudes about the police and improved cooperation. The positive effect of community policing as a strategy is encouraging. Decades of distrust between minority communities and the police has damaged community/police relationships.

Law enforcement practitioners seeking to lead beyond the status quo would benefit from the replication of the Peyton et al. (2019) study. The police department chiefs or directors would have their officers randomly visit residences in the community for 10 min. The officers would introduce themselves and do a wellness check of the residents, such as "Is everything okay?," to assure the residents that no one is in trouble, and they are just asking for honest feedback about the police. They would provide the residents with a business card with their handwritten work cell phone number on it, and then they would depart with a smile. The research suggests that this simple strategy can significantly improve community/police relationships. It is suggested that effective policing is based on the idea that crime should be prevented. The public's view of the police and their actions to prevent crime should matter – independent of how effective the police may or may not be (Davis 2019).

## Conclusion

Police administrators and policy developers should consider the adverse impact of implicit/explicit bias, structural racism, and social inequity on community policing and police-community relationships during the coronavirus Covid-19 pandemic. The deaths of Black men in police custody such as Freddie Gray (Baltimore, Maryland), or the police shooting death of unarmed Black men like Stephon Clark (Sacramento, California), highlight the historical relationship between police departments and Black and Brown citizens. Police violence against unarmed Black and Brown citizens in the United States has led to public distrust of police, and increased fear of police in minority communities. In this climate where Black and Brown citizens mistrust the police, in comparison to their White counterparts, the uneven enforcement of CDC coronavirus Covid-19 recommendations of social distancing and mask wearing have challenged the concepts of community policing and the legitimacy of the police.

Police practitioners, policy developers, elected officials, and community stakeholders respond to line of duty deaths of police officers with a unified voice. However, calls for unity in communities are made when police violence results in the shooting deaths of unarmed Black and Brown males, or the custodial deaths of these males. This entry examines the adverse impact of uneven policing practices; the negative effect of policing strategies like stop and frisk on the perceptions of police officers by minority communities; and the positive effects of non-law enforcement interactions between police officers and these communities (Peyton et al. 2019).

The ongoing challenge for law enforcement leaders and policy developers is to reimagine policing that is equitable; reconsider who police consider community; and to commit to law enforcement practices that benefit everyone equally. Law enforcement practitioners may reduce the tensions between police officers and Black and Brown communities by implementing suggested non-law enforcement community policing strategies, giving balance to the community's perspectives on the impact of police practices and developing trust-building policies that seek to effect individual-level attitudinal changes for the public and the police.

# Policies and Governance of Knowledge Commercialization in IRAN

Ghasem Salimi[1], Mehdi Mohammadi[1] and Mohsen Sepahi[2]
[1]Faculty of Education, Shiraz University, Shiraz, Iran
[2]Shiraz University, Shiraz, Iran

## Synonyms

Governance; Higher education; Knowledge commercialization; Policies; Strategies

## Definition

Nowadays, universities are increasingly paying attention to commercialization of knowledge through developing new economic/financial/educational policies. Indeed, the considerable increase in commercialization of academic research over the last few decades can be considered as an effective strategy for ensuring universities' success. Considering this and the fact that managers and policymakers can make more informed decisions through careful study of governance processes and methods, evaluation of research and technology commercialization and their different dimensions can be of great importance. Commercialization of knowledge in university involves economic utilization of intellectual property.

## Introduction

Expectations for economic development on the one hand and domestic pressures on the other have caused universities to establish knowledge-based companies, as a strategy for benefiting from innovation, and generate new sources of income (Deans et al. 2016).

University commercialization emerges from the theory of academic capitalism and involves all activities aimed at attracting external resources (Eesley et al. 2014). On the other hand, in most countries, governments are redefining their roles in funding universities; therefore, universities need to achieve independence and finding ways for obtaining sufficient fund. This way, they can complete their academic missions and preserve their educational values. The transformation of knowledge into an important competitive advantage in today's world has caused countries to pay special attention to research centers and knowledge production. This also has helped them undertake fundamental reforms in their academic functions, processes, and missions (Siegel et al. 2004). Commercialization of university knowledge involves economic utilization of intellectual property (Rasmussen et al. 2006). Commercialization is the process of developing a business through feasibility study of an idea and applying it until its acceptance in the market (Rosa and Rose 2007).

Knowledge commercialization is the process of turning knowledge produced in universities and research centers into products which can be marketed. Many studies have considered knowledge as a driving force for economic growth and a factor which can increase productivity (Friedrichsen et al. 2017). Transfer and commercialization of knowledge in today's world can play a major role in improving human capital and enhancing reputation of universities. Realization of these two is possible only through attracting the most brilliant students from top colleges (Nelson 2014). Commercialization of researches is a process that converts the produced knowledge in research organizations into suppliable products in the market or industrial processes (Salter and Martin 2001).

In fact, universities have shown great interest in commercializing of research and innovation. This way, they try to be financially independent. In fact, a case study of some universities in Iran has highlighted commercialization as the gateway to privatization, but adoption of ineffective commercialization strategies can often lead to a waste of time and resources.

Commercialization is the process of transfer and transformation of theoretical knowledge

existing to certain types of economic activities. Commercialization process starts with marketing technology insights and ends with sustainable products functions to the market (Spilling 2004).

Etzkowitz et al. (2000) believe that the mutual relationship between the university and society has been gradually established based on knowledge. Furthermore, as the researcher has stated, universities have been able to play an active role in economic development. It is noteworthy here that the university-industry collaboration can enrich theorizing fields in universities. Commercialization of research results is one of the most important components of the innovation system which can ensure continuity of research, provide significant economic benefits for organizations, and promote growth of knowledge-based economies.

Indeed, commercialization of research results is not a simple process which is stimulated by academic sector alone. In other words, this process involves interactions between multiple different socioeconomic sectors and is influenced by legal and regulatory framework, as well as executive capabilities. Therefore, success of the academic sector in commercializing research results depends on satisfying essential prerequisites in academic and industrial sectors and in socioeconomic environment in the two sectors. As long as research and development policies are not in line with the basic needs of the national innovation system, research conducted in the academic sector will not have the necessary quality to attract the resources provided by the industrial sector (Abd Latif et al. 2016).

The importance of knowledge transfers and commercialization and application of research results in higher education management in developing countries are crystal clear. In such developing countries as Iran, creation of incubators, science and technology parks, and reproduction and commercialization of knowledge in humanities and behavioral sciences and engineering are considered as important missions of new generation of universities.

It must be acknowledged that understanding of knowledge governance is substantial. Governance entails to "the process of governing societies in a situation where no actor can claim absolute dominance." This process is a "dynamic process involving implementation and monitoring as well as decision-making." Therefore, "creating and sustaining policy relevant knowledge is impossible without some sort of governance structure in place" (Fazekas and Burns 2012, p. 7). Studies have shown that the development of innovation networks is possible through knowledge policy (Rammert 2002). Moreover, the sharing of scientific knowledge and dissemination of knowledge always play an important role in industry collaboration (Evans 2010).

Higher education systems and research institutions, especially universities, have adopted various practical policies on and successful strategies for commercialization of knowledge in recent years. Iran and Iranian universities have been no exception in this regard. Iranian universities need to follow effective strategies for and policies on commercializing of knowledge and establish a collaborative university-industry relationship.

In line with these goals, the present study seeks to answer the following research questions:

What policies of and strategies for commercialization of knowledge have been adopted by higher education system in Iran over the past decade?

What are the central problems or challenges facing commercialization of knowledge in higher education in Iran and how can they be addressed and resolved?

## Commercialization of Knowledge in Higher Education: Concepts and Effective Factors

Commercialization involves from of a new idea and its implementation through developing a new product, offering a new service or stimulating a new process. Commercialization can lead to significant growth of the national economy and increase the employment rate as well as the net profit of innovative companies (Astebro 2003).

Commercialization is the process of developing a business by investigating an idea and

translating it into a product or service in the market (Rosa and Rose 2007).

Reviewing previous studies, one can state that there are two major streams of research on commercialization of knowledge. One is the "technology transfer," which was first introduced in the 1980s. Based on this movement, commercialization is a process of technology transfer from university to industry which can be promoted through addressing through overcoming the existing barriers and resistances among university and industry stakeholders. The second one is "enterprise and organizational resources" which was proposed at the beginning of the twenty-first century. This trend identifies desirable corporate and organizational resources, including supportive business infrastructure and organizational incentives, makes access to high-risk stocks and investments possible, and plays a major role in improving business performance of researchers (Chang et al. 2009).

In the following, one can see a number of studies conducted on commercialization of knowledge and its different dimensions, and factors which can affect it in different countries.

- Exploring the path to success in knowledge commercialization (Bauer et al. 2017.
- Developing a framework for successful commercialization of academic research (Norain et al. 2015.
- Transferring business knowledge from university to companies (Siegel et al. 2004)
- "Teaching work in the context of the commercialization of higher education in Brazil" (De Sena Brito and Nunes 2020)
- Identifying the role of emotional dimensions in commercialization of research in higher education (Gretzky and Lerner 2020)
- Identifying the role of university knowledge transfer offices in commercializing research outputs (Zhou and Tang 2020)

The following studies, as Sepahi (2019) has reported, revolve around commercialization:

- Developing a model of policymaking in knowledge commercialization nanotechnology
- Considering knowledge commercialization as a solution to increase income of universities
- Designing a conceptual model of knowledge commercialization in distance education
- Designing and explaining a model of university entrepreneurship education in University of Tehran Science and Technology Park
- Identifying organizational factors affecting commercialization strategies of academic research
- Conceptual modeling of commercialization of academic research
- Identifying and prioritizing factors affecting commercialization of products of knowledge-based companies
- Analyzing challenges in commercialization of humanities research
- Identifying facilitators of commercialization of knowledge humanities
- Designing a model of commercialization of humanities research with an emphasis on the approach in management consulting industry (Sepahi 2019)

In many Western countries, there are technology transfer offices which facilitate transfer of commercial knowledge from universities to industry (Siegel et al. 2004). Following commercialization strategies, university administrators of Iran, too, are involved in such activities as joint university-industry research, consultation, or teaching personal skills to solve their clients' problems, formation of organizations and companies in which financial benefits are gained through selling research results, and research projects sponsored by government research or industrial companies (Abbasi et al. 2009, 2012).

Based on previous studies, factors affecting commercialization are of four different types, namely individual characteristics, organizational factors, institutional factors, and external factors. Accordingly, spin-off companies' behavior can be a reflection of individuals' actions, and thus greatly influenced by individuals' personality traits, abilities, and desires for being actively engaged in entrepreneurial behavior (D'Este and Patel 2007).

Researchers tend to make connections between activities related to technology transfer, the nature

of academic research, and the presence of technology incubator centers and technology transfer offices in universities (Markman et al. 2005).

The third-generation research further suggests that academic technology transfer activities can be a reflection of institutional behavior. Based on this belief, universities which support commercialization activities have higher levels of commercialization and higher rates of technology transfer activities (Humphreys and Wilken 2014).

Finally, some other studies have considered external factors as significant components of commercialization and have emphasized the impact of macroeconomic factors, especially access to venture capital, legal requirements for obtain a patent, and the region's knowledge infrastructure on commercialization activities of universities (Rasmussen et al. 2006).

Mehrabi et al. (2013) have identified the most important internal and external factors affecting success in knowledge commercialization in Iran.

Based on their findings, these factors include market orientation, customer focus, role of senior management, intellectual asset management, role of individual factors, and participation and interaction in commercialization of knowledge.

In summary, despite policies established for development of knowledge commercialization processes in Iranian higher education, the following issues have still remained as concerns of many universities, incubator centers, and science and technology parks in Iran:

- Marketing, financial, and investment services in companies located in incubator centers and science and technology parks
- Immaturity of entrepreneurial ecosystem in industry and higher education
- Development of entrepreneurial culture, infrastructure for knowledge production, and knowledge commercialization process, and improvement of human resource–related quality
- Concerns for developing organizational culture, organizational structure and strategies, and human resource management as the most significant factors for knowledge commercialization
- Ethical issues in commercialization of knowledge in higher education
- Launch of new products to the market as the major concern of knowledge-based companies for developing innovation and commercialization

However, special attention to the following issues has raised hopes and opened up new horizons for the future of this field in Iran:

- Developing a model of policymaking of commercialization of nanotechnology
- Designing a model of commercialization of interdisciplinary research (Sepahi 2019)

## Conclusion

A review of studies on knowledge commercialization in Iran can indicate that commercialization of academic research has been considered as one of the central foci of Iranian universities and research and scientific centers. Furthermore, establishment of knowledge-based companies in Iranian universities can be considered as a strategy used for taking advantage of academic innovations. Through establishing the Office of Industrial Relations, universities sought to transform knowledge produced in universities and research centers into marketable products. The result of a decade of research on knowledge commercialization can show that universities have had a great desire for commercializing research. The findings further indicate that government has had a supporting role in this regard, for instance through following the policy of establishing science and technology parks and creating start-ups. It can be stated that Iranian higher education system research institutions and universities have adopted various practical policies on and successful strategies for commercialization of knowledge in recent years. In line with these, identification of challenges to and facilitators in commercialization of humanities research, and designing of models of commercialization of humanities have been the main foci of Iranian policymakers and higher education planners. Despite these, there are

still serious concerns about development of entrepreneurial ecosystem in Iranian higher education.

# Policing in Implementing Social Policy

Damian O. Odunze
Texas Southern University, Houston, TX, USA

## Synonyms

Policing: Enforcing; Guarding; Inspection; Keeping public order; Law enforcement; Monitoring; Overseeing; Peace enforcement; Protection; Regulating; Supervising.

Policy: Action; Administration; Approach; Guideline; Law; Method; Plan; Practice; Program; Protocol; Regulation; Scheme; Strategy; Theory.

## Definition

Policing refers to maintenance of public order by various government law enforcement agencies. These federal, state, and local agencies help to prevent and detect crime and enforce laws and regulations for the sake of public safety, health, morals, and protecting civil liberties.

A policy is a course of action and strategy adopted by a government, business, or individual in order to attain a certain goal. Social policy is a public or government policy, strategy, or program for dealing with human or societal issues. The government initiates social policies to address particular problems in the society. For instance, the War on Poverty was a social policy that addressed the social inequality in the United States in the 1960s. The Lyndon Johnson administration believed that it was the role of the government to cure and prevent poverty, especially by expanding the federal government's role in education and health care (Weisbrod 1965; Rector and Sheffield 2014).

## Introduction

In the United States, policing comprises a complex medley of agencies at the federal, state, and local levels. Law enforcement agencies (LEAs) provide several vital functions such as crime prevention, criminal investigation, implementing law and order, and rendering social services. These agencies are an essential part of the society as they are the first line of defense in protecting individual liberty, the right to private property, and also serve as a bulwark against social anarchy. LEAs are part of the executive branch of the criminal justice system. As a result of their administrative and bureaucratic nature, LEAs are a political entity and thus are influenced by politics and government (social) policies and, in turn, affect politics and the social policy process.

The United States is founded on the principles of democracy with constitutional guarantees that protect the rights of citizens against government power. These civil liberties are enshrined in the Bill of Rights (the first ten amendments to the Constitution). The constitution also ensures that citizens have rights and protections against LEAs, such as the police, who act as agents of the government. One of such protections is the Fourth Amendment, the right against unreasonable searches and seizures. This is to guard against arbitrary harassment or arrest of citizens on simple suspicion and to prevent the police from usurping the power of the people. However, a dilemma arises as the police or other LEAs try to balance the protection of individual rights and the maintenance of public order. For instance, the police protect a person's rights by ensuring that the rights of other people are not violated and, if violated, that order is restored. So, the same agency that is charged to protect one's rights is also mandated to take away the right when it is violated. This is the quandary of policing in a democratic society (Goldstein 1977). Police officers are given a great degree of discretion in order to enable them balance these rights. In a given scenario and depending on the nature of the offense, the police may choose to do nothing, give a warning, or make a physical arrest. The use of discretion by the police is also restrained by the law. There are several landmark cases that recognized these restrictions, such as the Miranda v. Arizona

(1966), regarding the famous Miranda warning, or the Tennessee v. Garner (1985) regarding police use of lethal force. There also limitations on police behavior imposed by agency procedures, policies, rules, and regulations.

Many roles the police play in society have been dubbed an "impossible mandate" or an "impossible job" (Manning and Van Maanen 1978; Moore 1990). The police, unlike other organizations, do not have an all encompassing primary goal or objective. Policing involves numerous goals, and the ability to perform these functions is basically impossible. The police are supposed to be the watch-guard of the community, looking out for criminals. In addition, they enforce any violation of the law and also perform a variety of services to the public, such as emergency medical services. The police are also mandated to produce official measures of overall crime levels (crime statistics) and to provide a rolling commentary on the relation between crime and the wider social trends. The Federal Bureau of Investigation's (FBI) Uniform Crime Report (UCR) now converted to a National Incident-Based Reporting System (NIBRS) is a police measure of crime from the local and state agencies. This national data series has been collected since 1930 to generate accurate crime statistics for LEAs. Over the years, the cost of policing and keeping the society safe has been increasing. This is also compounded by many government policies, such as the war on drugs and the war on terrorism since the September 11, 2001 terrorist attacks. While policing has become more expensive and complex, LEAs are at the same time expected to be more efficient and effective. It is being debated what policing is really all about: fighting crime (street crime, white-collar crime, cyber crime), enforcing law or peacekeeping, crime control or crime prevention, and crime mitigation or reducing fear. Policing has also expanded since 9/11 to various aspects of homeland security. New policing strategies have also evolved including community-oriented policing (COP), problem-oriented policing (POP), intelligence-led policing (ILP), and data-driven policing.

## Historical Context of Policing

The history of law enforcement in the United States (USA) goes back to the colonial period in America. During this era, what obtained was a system of sheriffs, constables, the watch, and ward. Law enforcement was often corrupt, inefficient, and subject to political manipulation. Law enforcement officers were seen as an extension of the colonial government. They had little capacity to prevent crime or arrest offenders. Victims of crime had no expedient ways to report crime. Criminal gangs could easily bribe law enforcement officials. Consequently, official law enforcement agencies played a rather small role in the maintenance of law and order. Independence from Britain and the passage of the Bill of Rights in 1791 further minimized the role of the sheriffs and constables because the officers posed a danger to the civil rights or freedoms of citizens. Subsequently, policing was left in the hands of local authorities instead of creating a national or state police. The growth of cities also led to increase in crimes. This was exacerbated by the social disorientation of communities, as neighborhoods changed with the arrival of new immigrants. This posed challenges to keeping communities safe and would result to a form of organized policing.

Kelling and Moore (1988) distinguished three periods in the history of organized policing in the United States: the political era, the reform era, and the community era. A fourth epoch is what some scholars refer to as the contemporary or homeland security era (Oliver 2004). The first era, which started around 1840, lasted until about 1900. This time marked a wave of migration of people from various cultures to the country. The socio-economic and political differences between the new immigrants and the residents resulted in a breakdown of law and order and even led to riots in some cities. For instance, between 1834 and 1838, Boston, Massachusetts, witnessed three major riots. New York also endured similar incidents resulting in loss of lives and destruction of property. As crime and disorder rose, there was no organized police force to respond to these

problems. In 1838, Boston established the first police department in the United States. New York followed in 1945 when it created its first police department. Policing during this period was done mainly by foot patrol, and so the police became acquainted with the people, were integrated into communities, and garnered the support of citizens. In addition to crime prevention, the police also rendered social services, particularly to the new immigrants. However, the closeness of the police to politicians, inadequate formal training, and lack of supervision of officers led to corruption, inefficiency, and lack of professionalism.

The reform period (1900–1970s) was characterized by efforts to free policing from the control of politicians and to restore police professionalism. This marked the beginning of formal police training in some police departments and a centralization of the police department. Law enforcement roles were emphasized over the provision of social services by officers. This period also marked the introduction of new technology, such as the walkie-talkie (two-way radio), telephone, and the 911 emergency systems. The use of technology brought greater efficiency to police operations, as they were able to react faster to crime and respond rapidly to calls. Despite these changes, there was still an increase in crime. The reliance on technology gradually alienated the police from the people as they spent less time on the streets and lost the support and cooperation of the people. As crime rose, citizens questioned police tactics. The civil rights movement and the antiwar movement gave more impetus to the voice of citizens. Minorities, particularly African-Americans and women, demanded equal justice. From 1964 to 1968, there were riots in various cities in the United States as a result of tensions between the police and the African-American community, who perceived the police as being unfair to them.

The community era was a response to the deteriorating police-community relations, the upsurge in crime, demonstrations and street riots, and student unrest of the 1960s. The Omnibus Crime Control and Safe Streets Act of 1968 (under the Johnson administration) set up the Law Enforcement Assistance Administration (LEAA) under the Department of Justice. LEAA provided federal funds for state and local police agencies to help them implement the principles of police-community relations. The 1970s marked the beginning of such programs as "team policing," as the police tried to reach out to neighborhoods to mitigate some of their problems. Neighborhood Watch programs were also introduced to help citizens report crimes and suspicious activities to the police. The implementation of these programs was not well executed. The neighborhood watch was eventually abandoned after some time. In the 1980s, community policing was introduced. This was a policy of getting the police on the street to interact more with citizens. The concept of community policing was introduced by Wilson and Kelling (1982). They stated that disorder in neighborhoods creates fear. Communities, which are in distress such as those filled with gangs, street people, drug addicts, and prostitutes, send out crime-promoting signals. The same holds for neighborhoods with fading houses, unfixed broken windows, and graffiti. People live in fear in these places and criminals are attracted to them. According to Wilson and Kelling, the police need the cooperation, support, and collaboration of citizens in order to reduce crime and the fear of crime. To achieve this, the police have to interact closely with the people who could provide crucial information to the police. The passage of the Violent Crime Control and Law Enforcement Act of 1994 bolstered the implementation of community policing. The act brought federal support for community policing programs. Furthermore, the Office of Community Oriented Policing Services (COPS) under the Department of Justice provided grants to state and local agencies to recruit more personnel, provide training, and purchase equipment to enhance efforts toward community policing.

The terrorist attack in the United States on September 11, 2001 (9/11) marked the onset of the homeland security era (Oliver 2004). The government set up the Office of Homeland Security as an institution to focus on antiterrorism (prevention mechanisms) and counterterrorism (to actively respond to terrorists). In addition, it

serves as a command center for responding to natural disasters. The passage of the USA Patriot Act of 2001 gave law enforcement greater surveillance powers, enhanced punishments for crimes related to terrorism, and greater communication between federal and local law enforcement. The Homeland Security Act of 2002 further confirmed the critical role of the police with regard to homeland security. The document emphasizes the role of the police in such issues as intelligence gathering, domestic counterterrorism, protection of critical infrastructure, emergency preparedness and response, and information sharing.

The complexity of policing in the United States shows that law enforcement officers operate at many different levels that embrace various agencies. According to the US Bureau of Justice Statistics, there are about 18,000 state and local law enforcement agencies (LEAs) with over 1.1 million full-time employees. Local police departments account for 60% of the total number of sworn personnel in law enforcement. The various LEAs have different jurisdictions, responsibilities, and powers. Although there are federal LEAs, there is no national police force in the United States. The federal LEAs make up about 10% of all LEAs in the nation. These federal agencies which number over 50 deal with federal offenses. The Department of Justice has the largest federal law enforcement agencies. The major LEAs under its control include the Federal Bureau of Investigation (FBI), the US Marshals Service (USMS), and the Drug Enforcement Administration (DEA). There are also the Department of Homeland Security law enforcement agencies, which are outside the purview of the Department of Justice.

The FBI is the main investigative arm of the federal government. The FBI is charged with a wide range of responsibilities, including combating organized crime and drugs, terrorism, white-collar crimes, cyber crimes, foreign counter intelligence, and violent crimes. The FBI also helps other agencies with important services such as fingerprint identification, laboratory/forensic examination, and police training. It also collects and publishes a national crime statistics through its annual UCR/NIBRS program. The FBI is headed by a director who is accountable to the attorney general of the federation for its operations. The US Marshals Service, which is the oldest federal law enforcement agency, was created by the first Congress in the Judiciary Act of 1789 (US Marshals Service 2004). The agency has the responsibility of providing judicial security and services for the federal courts, such as serving writs, and is also in charge of fugitive investigation. The marshals work in tandem with other LEAs at the federal, state, and local levels as well as international agencies in tracking down fugitives. In addition, the agency is responsible for housing federal prisoners who are awaiting sentencing. The president appoints the director of the Marshals Service who supervises the operations of the agency throughout the United States and its territories. The Drug Enforcement Administration (DEA) was created in 1973 during the Nixon administration. The DEA is primarily responsible for the enforcement of federal laws concerning the use, sale, and distribution of narcotics and other controlled substances in the United States. It also regulates the distribution of legal narcotics and drugs and investigates drug seizures by the US customs agents at border points. The DEA cooperates with local and state LEAs and foreign governments in efforts aimed at combating illegal drug use and the circulation of opium and other harmful substances.

The Department of Homeland Security (DHS), which is an offshoot of the 9/11 terrorist attacks, has a number of federal law enforcement agencies under its organizational chart. The major agencies that report to the DHS include the US Citizenship and Immigration Services (USCIS), US Customs and Border Protection (CBP), US Immigration and Customs Enforcement (ICE), the US Secret Service (USSS), the US Coastal Guard (USCG), the Transportation Security Administration (TSA), and the Bureau of Alcohol, Tobacco, Firearms and Explosives (ATF). There are also other agencies that the DHS oversees, such as the Federal Emergency Management Agency (FEMA), the Agricultural Quarantine Inspection Program, the Chemical and Biological Defense Programs, the National

Infrastructure Protection Center, the Federal Computer Incident Response Center, and others.

In addition to the federal law enforcement agencies, there are many state and local LEAs, which vary from state to state or from county to county. State LEAs include state police, highway patrols, and state investigative agencies. State LEAs exercise jurisdiction in a particular state, and some share responsibilities with local police agencies. They enforce traffic regulations, conduct criminal investigations, arrest criminals, and provide a variety of law enforcement services. Local law enforcement agencies include county sheriffs, municipal police officers, and special police (such as transit police, airport police, public school police, public housing police, university and campus police, and park police). The jurisdiction of these police agencies is limited to specified boundaries. Local police officers, particularly municipal police departments, play significant roles in crime prevention and investigation, since most crimes occur at the local level.

## Analysis and Conclusion: Policing and the Intersection of Social Policy

The operations of the various law enforcement agencies are guided by government policies and legislation. When these agencies implement a particular program, they are carrying out a program that is most likely part of a larger crime policy. The police and other LEAs also help to shape social policy as the crime problems they address daily in cities and counties help policymakers to respond to these issues and in passing legislation on crime. For instance, the federal government's "war on drugs" and the various antidrug abuse legislations had the goal of reducing drug abuse in the United States. The various programs by law enforcement, such as crackdowns on the open-air markets, boot camp for drug addicts, and school seminars on dangers of drug use by the police, have the same policy objective of diminishing the use of drugs. Technological advances, changes in the law, and court decisions can also affect the way LEAs exercise their duties. For example, many incidents of police-on-citizen homicides, especially following the US Department of Justice investigations on Ferguson (2015) as a result of the death of Michael Brown, have led many police agencies to opt for the use of body cameras during encounters with citizens. Some police departments have even gone further to review their policies on the use of deadly force by police officers. There have also been calls for more transparency and greater accountability by police officers. Furthermore, the events of 9/11 brought new changes in homeland security, protection of the nation's critical infrastructure, and counterterrorism. New strategies of policing and intelligence gathering have been introduced.

The traditional method of policing assumed that the police were able to deter crimes by patrolling the neighborhoods, acting swiftly to arrest suspects, and using technology and investigative skills to solve crimes. This reactive approach was questioned in the 1970s as crime rates increased. New initiatives were put forward for a more effective policing aimed at keeping communities safe. There has been a gradual shift from the "traditional" policing to policies such as community-oriented policing, problem-oriented policing, zero-tolerance policing, and intelligence-led policing.

Community-oriented policing (COP) can be traced to Wilson and Kelling's (1982) "broken windows" theory of what works in policing and how to make the police more effective. The authors pointed out that disruption in the social order can lead to serious crime incidents. They underscored the importance of police-community partnership in crime control. COP is not a program, but a law enforcement philosophy or way of thinking about improving public safety. It emphasizes building good police-community relationships for effective long-term solutions to crime and enhancing police legitimacy and trust among citizens. Contrary to what some critics argue, COP is not softer on crime but seeks "smarter" ways of controlling crime. Some of the programs adopted include fear reduction, organizational transformation, and promotion of police-community partnerships, problem-oriented (focused) policing, and zero-tolerance policing.

A successful community-oriented policing strategy involves transformational changes in the organizational structure and operation of a police agency. The aim is to transform the management policies, structure, personnel, culture, and resources, including information technology systems to address the concerns of communities. Community policing also entails a decentralization of operations, which means devolution of power and decision-making that is less hierarchical. In other words, local officers are given more authority and discretion in finding creative solutions to specific, individual neighborhood problems without strict adherence to very rigid policies (Diamond and Weiss 2009; Maguire and Wells 2009). Community partnerships are equally critical for effective community-oriented policing. This goes beyond frequent contacts or sharing information with citizens. It involves ongoing efforts to work together with communities to address their problems. Law enforcement officers try to engage neighborhoods through community leaders, neighborhood associations, faith-based groups, tenant councils, business organizations, local government agencies, social service providers, and schools. LEAs also utilize information technology to improve communication with citizens and have websites (including e-mails) where citizens can get information on crime alerts, provide crime tips, give feedback, and share their concerns. Partnerships with communities help to build trust and mutual respect between the police and citizens, which is very vital for effective policing. It is also a prerequisite for a more proactive problem-solving or problem-oriented policing (POP).

Problem-oriented policing brings together law enforcement officers, analysts/researchers, and community members to identify the root causes of a problem and to find creative ways to address them. Goldstein (1977) criticized traditional police practices that were primarily reactive and incident (means) driven. He advocated a paradigm shift to a model that required the police to be proactive in identifying the underlying problems that could be targeted to reduce crime. He termed this new approach "problem-oriented policing" to emphasize the need for the police to focus on problems instead of single calls or incidents. The police have to deal with a range of problems in the community, including not only crime but also social and physical disarray.

Police agencies that adopt this method focus more on creative and active crime solving and prevention, rather than merely reacting to crime and deviance. One of the most common methods used in problem solving in policing is the SARA model (Eck and Spelman 1987). SARA (scanning, analysis, response, and assessment) is a four-step problem-solving model. The first step is for law enforcement officers to scan their environment for problems and identify and define the problem. The next step is to analyze the problem by identifying the persons involved, determine the scope of the problem and the causes, and describe the setting and social context. By talking to members of the community, the officers can collect valuable data. The third step is the response. The police officers develop an action plan with the community to solve the problem. Finally, the process is evaluated to assess its effectiveness. POP approaches have been successful in implementing effective responses to identified social problems. In recent years, the US Department of Homeland Security (DHS) has also tried to put into use some of these policing models. It has incorporated the SARA model into its incident command system (ICS). The ICS is a management system designed for use by multiple agencies from the same sector or multiple agencies across sectors, to manage large-scale events, terrorist attacks, or natural disasters.

Another method of policing that was created in the 1980s was the zero-tolerance policing. The idea was derived from Wilson and Kelling (1982) article, "broken windows." While COP aspect of the article focused on police-community partnerships in addressing crime and social disorder, zero-tolerance focuses on the article's postulation that minor crimes and disorder eventually lead to serious crime. By enforcing minor crimes and removing signs of disorder (such as graffiti), the police sends signals that crime will not be tolerated in the neighborhood, and this helps to restore order and reassure citizens of their safety. This strategy utilizes aggressive means of law

enforcement by focusing on "hot spots" of crime and disorder. This tends to be effective in communities that have experienced decay and high crime rates, and citizens' level of fear is already high and so they are unable to collaborate with law enforcement officers. It is a controversial method of policing and has had mixed results in cities where it was implemented.

Another concept of policing that has practical application to LEAs and has been a focus of many agencies is intelligence-led policing (ILP). This British system of policing was adapted to American policing in the wake of 9/11 terrorist attacks. ILP is mainly a tool for information sharing among LEAs that allows for the formulation of intelligence, which can be used to identify security threats and develop responses to tackle those threats. The police have expressed concerns of the shifting of resources from community- and problem-oriented policing (COP/POP) to intelligence-based policing as a result of increased homeland security responsibilities (Carter and Carter 2009). This raises an issue of how to integrate community policing and ILP. These models of policing depend on strong relationships with the community. Both homeland security and other LEAs need to have greater collaboration with each other and dialogue with the community in order to successfully combat crime. Problem solving, environmental scanning, effective communication with the public, fear reduction, and community mobilization to deal with social problems are among the crucial attributes COP brings to effective policing.

Data-driven policing which is closely related to ILP is another model that many LEAs have adopted in the post 9/11 era. In this case, information is gathered not necessarily for the development of intelligence, but rather to help the police officer on the street to more effectively respond to calls. Information can consist of records of past calls for service or criminal activities or the presence of any threats such as guns in a particular location or residence. In contrast to ILP, which drives information up to the strategic level, data-driven policing primarily pushes information down to the tactical level (Oliver 2009).

Finally, it is important to recognize that many law enforcement agencies are not diametrically opposed to each other. Rather, they are focused on achieving the same goal: reducing crime and maintaining public safety. The various models or approaches in policing and in implementing social policies are not competing against each other. They work at various levels of policing and in different contexts. Policing has always been a dynamic process responding to new challenges to public safety and adopting new strategies in order to be more effective in combating crime and social disorder. Police agencies and other LEAs can increase their organizational knowledge about the science of crime control by forming partnerships with local universities and colleges to utilize the services of professors, graduate students, or interns. They can also hire their own in-house criminologists. By connecting science to the development and evaluation of crime control approaches or models, there is an inherent understanding that local knowledge and experience must be blended with scientific evidence to create operationally sound and socially realistic programs. Such a balanced approach will help decision-makers to adopt the best scientific evidence regarding strategies to achieve desired outcomes. Law enforcement agencies have proven to be tough on crime; it is time to demonstrate they can be smart in fighting crime.

### Synonyms

Capability; Capacity; Governance capacity; Institutional capacity; State capacity

Policy capacity is a relative new concept developed in the field of policy studies that derives from the state capacity debate. After a period of disinterest, in the 1980s and 1990s, on the state as a subject of analysis in the political studies and the focus on processes of transition to democracy and factors that limit and control political power, capacity approach revitalizes the discussion on the accumulation and operation of state's power (Fukuyama 2013).

State capacity was initially conceived as an analytical category to examine processes of state formation in comparative historical experiences of economic development. In other words, its original conception entailed the question on how state capacity conditions countries' economic development (Amsden 1989; Evans 1992). However, the concept's malleability allowed the expansion of its content and further applications in distinct disciplinary fields for an increasing number of researches' aims (Cingolani 2013).

Aside from the subject of the role of the state in economic development, state capacity is applied to analyze other issues such as emerging forms of governance in the public sector, experiences of public administration reform and innovation, conditions and dynamics of policy making process, among others (Cingolani 2013). The variety of state capacity's aims led to the concept's growing multidimensionality. A nonexhaustive listing of capacity's dimensions entails, for instance: bureaucratic or administrative, relational, political, military, fiscal, legal, infrastructural, industrial, and so one (Cingolani 2013). Indeed, while capacity of collecting taxes, enforcing law, and declaring war are more significant for studies on state formation, capacity of acknowledging and negating with policy stakeholders, providing informed advice and building external partnerships are showing relevance in the policy making process in both developing and developed contexts (Repetto 2004; Gomide and Pires 2014; Pires and Gomide 2016).

Policy capacity emerged as one of that usage's variations of the capacity term. As in the state capacity literature, there is no consensus on policy capacity definition and its possible implications are still being explored. Two main approaches, though, can be pointed out looking at the current stage of the concept's development. The aspect that distinguishes them is basically their level of comprehensiveness.

While the narrower and initially formulated meaning focuses more specifically on bureaucracy's capability of collecting and analyzing information to support policy making (Bavkis

2000; Lindquist and Tiernan 2011), the broader and most recent definitions of policy capacity examines distinct policy functions to identify government's ample capability and autonomy to make decisions and to produce actions towards desired policy objectives (Painter and Pierre 2005; Wu et al. 2015).

Even though both conceptions aim to examine governments' accumulated resources to policy making, the latter meaning looks at policy functions throughout the whole policy cycle and the former approach gives emphasis to the policy formulation stage and the specific skills and infrastructure that provide knowledge for policy making purposes (Newman et al. 2017).

That distinction reflects in some level the development of the policy analysis field, which engaged scholars and professionals, particularly in Anglo-Saxon countries, towards the formation of a proper discipline that gathers specific knowledge, methods, and applications to support decision-making in the policy process. It distinguishes itself from the policy studies which consists in studies *of* the policy process to focus on producing knowledge and research *for* public policies (Farah 2016). The professional category of policy analysts evolved from that, courses and academic departments were created, and job positions are now found in governments agencies, think tanks, political parties, interest groups in different countries' contexts (Vaitsman et al. 2013).

One may argue that the more restricted elaboration of policy capacities derives from investigations that looked at the policy analyst's function. The broader meaning, in its turn, engages with most recent findings of empirical works that show that a larger range of tasks are performed by policy analyst and multiple roles and governance arrangements are requested from government to allow the policy production in the contemporary context (Colebatch et al. 2010; Mayer et al. 2004). Therefore, capability of negotiation, mediation, and clarification of values and arguments among the distinct policy stakeholders is understood as essential capacities for governments as the analytical capacity for building cohesive public policies. Moreover, systemic resources such as rule of the state, merit system, social trust, and government legitimacy among society are pointed out as equally necessary for policy production (Wu et al. 2015.

The multiplicity of definitions and studies of policy capacity echoes, thus, that trajectory in the policy studies.

Painter and Pierre (2005) comprehensive work on the conception and implications of policy capacity for governing, proposed the following definition: "Policy capacity is the ability to marshal the necessary resources to make intelligent collective choices about and set strategic directions for the allocation of scarce resources to public ends" (p. 2). Policy capacity is understood as one of the three types of capacity that compose governing capacity. The other two types are the administrative and state capacity. While the first is conceived, in that proposition, as the ability of managing state's different resources, the second entails relational capabilities through which internal and societal support is achieved for policy production.

That proposition is developed in dialogue with the institutional analysis, considering thus in the governance process not only government structural characteristics and stocks of resources but also outcomes of relationships and interconnections between state and external actors such as society and the international system.

Despite their explicit distinction, the three dimensions are understood in Painter and Pierre's (2005) proposition as interdependent. Policy capacity is conceived as essential to activate the other two dimensions, given that it enables the strategic decisions that guide the mobilization of administrative and state capacities. Acknowledging that interdependency, policy capacity, in that model, is examined in conjunction with the support systems for administrative and state capacity. Not only stocks of institutional resources but also specific policy outputs and outcomes function as sources of evidence of policy capacity in that proposition.

Wu et al. (2015) propose a more operational conception for policy capacity in contrast with the dominant macrolevel perspective of the

existing definitions. Authors argue for a concept that acknowledges policy context and the performance of policy functions. Policy capacity is conceived in that proposition as the "set of skills and resources…necessary to perform policy functions" (p. 2) which are accumulated in three dimensions – analytical, operational, and political – and can be examined in three levels – individual, organizational, and systemic. In that approach, analytical dimension of capacity represents the policy analysis function abovementioned, while operational dimension involves managerial roles and structures necessary for the bureaucracy internal functioning and, finally, the political dimension captures the governance deliberations on the products of the interactions between the state and external environment.

Dialoguing with most recent empirical findings, Wu et al. (2015) matrix model is a proposal for operationalizing policy capacity's multidimensionality. It aims to allow the simultaneous observation of distinct dimensions and levels of capacity. Two main assumptions are carried in its conception. Firstly, that not only the analytical but also operational and relational dimensions condition policy results. Secondly, that policy effectiveness depends not only on knowledges, skills, and judgments hold by policy professionals (policy analysts, policy makers, policy managers, etc.) but also on organizational resources and systemic conditions.

## The Concept Application in the Brazilian Context

From the narrower to the broader approaches, policy capacity debate is benefiting from an increasing number of empirical investigations that explores bureaucracy and public organizations conditions to contribute to different policy contexts. The concept malleability allows it operationalization as both dependent variable to assess government's performance as independent variable to have its constitution to be explained by all sort of factors such as level of education, policy work, professional carrier, among others (Gomide et al. 2017).

Looking at the Brazilian context some of these recent investigations entail, for instance, the construction of latent variables to compare agencies' levels of capacity and autonomy (Bersch et al. 2017), comparative study on the effects of institutional arrangements and state capacities in social, infrastructure, and industrial development policy fields (Pires and Gomide 2016), and analysis based on survey data of the interlaces between bureaucrats' policy work and policy capacity (Enap 2018).

However, while that flexibility is attractive, it also poses challenges in its application. Two main criticisms are pointed out by the literature. The first one concerns the general assumption of bureaucracy and public organizations as homogeneous and uniform entities. That assumptions do not take into account phenomena such as dissent or competition within bureaucracy that leads to unexpected behaviors and effects distinct from the original policy formulation (Peters 2015). The second one relates to the latency of capacity's concept. Acknowledging capacity as potential resources and conditions for state actions, one must argue that its direct observation is not possible and that indirect constructs are necessary to explore the phenomenon. That raises the risks of circularity, conceptual overlaps, and imprecisions in the object definition, demanding thus very clear and justifiable methodological choices in the concept operationalization (Mazzuca 2012; Cingolani 2013; Gomide et al. 2017).

An additional conceptual challenge must be considered in the Brazilian case. It is worth noting that in Brazil, the activity of policy analysis does not constitute a specific field of knowledge and professional category, as occurred in developed Anglo-Saxon countries. In Brazil, the activity of policy analyst is being developed and shaped in practice, relying on the local existing references and instruments (Vaitsman et al. 2014; Farah 2016). That lack of a clear conceptual demarcation on the policy actors' tasks and roles might have produced distinct patterns of policy production and policy capacity in the Brazilian.

Given to the influence of the field of policy analysis in the policy capacity development, that distinct route raises questions on the level of

applicability of the Anglo-Saxon's models and analytical tools of policy capacity in developing countries such as Brazil. In fact, more recent empirical inductive investigations are starting to show differences in the policy styles and the way policy capacity is mobilized in developing countries (Veselý et al. 2014; Saguin et al. (2018); Enap 2018). That is a path that deserves to be further explored to expand the concept's usage and understanding.

# Policy Coordination, Brazil

Erika Melissa Oliveira França Nassar
Ministry of Economy, Brazilian Federal Government, Brasília, DF, Brazil

## Synonyms

Policy collaboration; Policy coordination; Policy integration

## Definition

The policy coordination is a task usually attributed to the chief of the Executive Branch to integrate departments and processes to guarantee the governability aiming at conducting public policies and providing services to society.

## Introduction

One of the fundamental challenges of Brazilian public governance, policy coordination involves the hard task in articulating institutions; integrating processes, rules, systems, bureaucracy, and stakeholders to improve integration between different levels and spheres of the public sector; and avoiding redundancies and gaps in order to generate, preserve, and deliver public value.

Plenty of governing structures allied to contradictory and redundant public programs is a common sense diagnosis in public sector realities, particularly in federalist countries such as Brazil.

This article intends to bring readers to Brazilian policy coordination context, in progress in the end of the second decade of the twenty-first century, its rules, and its institutional arrangements with a view to fostering the coherence of government programs.

Experience in the federal government in Brazil reveals that the policy coordination has been anchored in arrangements and rules particularly related to budget allocation and strategic planning and institutional enhancements.

The purpose is to direct actions toward better results for society facing fiscal constraints and changing priorities and thus increasing the level of citizen confidence as a fundamental element of legitimacy of public performance (Casa Civil da Presidência da República 2018).

## Budget Allocation and Strategic Planning

Guy Peters, in a study prepared for the Canadian Centre for Management Development, reminds that the effort to coordinate public policy is central not only because public money now is less plentiful than it was in the past but also because governments have been facing pressure to reduce expenditures and appear likely to even greater pressure for the foreseeable future. This lack of proper coordination tends to generate internal conflict, reduce political creativity, run incompatible and contradictory programs, and thus require extra money. This creates the need to ensure that the various organizations charged with providing public policy work together and do not produce either redundancy or gaps in service (Peters 1998).

A key issue in improving this coordination is undoubtedly the improvement of state strategic planning that provides greater coherence and predictability for public action – and thereby facilitating the integration of policies and the achievement of shared goals (Casa Civil da Presidência da República 2018).

Thus, in 2018, based on a constitutional mandate, the Brazilian federal government prepared the preliminary studies for Brazilian 2020–2031 Strategy for Economic and Social Development (Endes), designed to guide other development planning instruments – national, sectoral, regional plans, and the Federal Multi-Year Plan (PPA). Endes was influenced by the 2030 Agenda expressed in 17 Sustainable Development Goals (SDGs) (Ministério da Economia 2019).

The Constitution of the Federative Republic of Brazil, promulgated in 1988, brings some important guidelines for the coordination of national planning and preparation of the public budget, in particular:

- Planning is decisive for the public sector and indicative for the private sector.
- The National Congress shall approve a multi-year plan, budgetary guidelines, and annual budget, based on Executive Branch proposal.
- The Legislative, Executive, and Judiciary Branches shall maintain an internal control system to evaluate the fulfillment of the goals provided for in the multi-year plan, the execution of government programs, and the budgets of the Federal level.
- Multi-year plan shall establish, in a regionalized manner, the guidelines, objectives, and

goals of the federal public administration for investments and other expenses related to continuing programs.
- National, regional, and sectoral plans and programs should be prepared in accordance with the multi-year plan and approved by the National Congress.
- Criminal liability in the cases of multi-year investment projects begins without inclusion in the multi-year plan.
- Social assistance actions should be organized according to political-administrative decentralization and federal general rules and citizen participation in policy design and control.

As can be seen, Brazilian Constituent Assembly established public planning and budgeting as important pillars in the political coordination for the establishment of a democratic state, designed to promote sustainable development: economic, social, and environmental.

## Public Planning and Budgeting

The Brazilian 2020–2031 Strategy for Economic and Social Development (Endes) is the main innovation that emerged in the Brazilian federal government planning process scenario since 2018 and has been ongoing since then. It is a long-term instrument – 12 years – that will guide the parameters for national plans, representing the strategic dimension of the multi-year plan, for the purpose of strengthen policy and program coherence.

The Federal Public Governance Committee – CIG, created by Federal Decree #9.230/2017, whose objective is to advise the President of the Republic in conducting federal public governance policy, recommended, in 2018, the design of preliminary Endes structure.

In 2019, in addition to recommending to the Ministry of Economy, the conclusion of Endes studies, CIG, coordinated by the State Minister of the Civil House, also established the guidelines and themes for the federal 2020–2023 Plan (PPA).

- Government guidelines:
  (a) Improvement of governance, modernization of the state, and federal public management, with administrative efficiency, transparency of state action, digitization of government services, and reduction of state size
  (b) Articulation and coordination with federative entities, combining contracting processes, transfer of resources and responsibilities, and monitoring and evaluation mechanisms
  (c) Increasing attack against corruption, violence, and organized crime
  (d) Appreciation of individual freedom and family-focused citizenship
  (e) Prioritization of the quality of basic education and preparation for the labor market
  (f) Increasing coverage and resolution of primary health care and strengthening integration between health services
  (g) Emphasis on generating opportunities and stimulating insertion in the labor market
  (h) Promoting the sustainable and efficient use of natural resources, considering environmental costs and benefits
  (i) Absolute commitment to solvency and fiscal balance, seeking to reinsert Brazil among investment-grade countries
  (j) Simplification of the tax system, improvement of the business environment, stimulation of competition, and greater opening of the economy to international trade
  (k) Efficiency of public sector action by valuing science and technology and reducing the role of the state in the economy
  (l) Increased private investment in infrastructure driven by long-term planning associated with reduced legal uncertainty
  (m) Keep military bodies in a permanent state of readiness for deployment, with improved interoperability and joint action
- Themes related to key sectoral areas to be mobilized to achieve the objectives set out in the guidelines:
  (a) Transparency and the fight against corruption
  (b) New pension and solvent fiscal policy
  (c) Education
  (d) Health
  (e) Social assistance, culture, and sport

(f) Intergenerational family bonds
(g) infrastructure, transport, energy, and natural resources
(h) science, technology, and communications
(i) Defense
(j) Strengthening of republican institutions
(k) Productivity and competitiveness with generation of opportunities and jobs
(l) Territorial development
(m) Justice and public security
(n) Agriculture and the environment
(o) Foreign policy and foreign trade

The PPA, by constitutional mandate, is drawn up every 4 years, sent by the head of the executive branch, and addressed to the National Congress no later than 4 months before the end of the first financial year of the presidential mandate. Under Ministry of Economy coordination, central planning process intends a better budget allocation and better management of public resources. The methodological pillars for the medium-term plan 2020–2023 are simplification, fiscal realism, integration between planning and evaluation, and strategic vision and focus on results.

All of these aspects are relevant for the effective coordination of contemporary public policy in view not only of the plurality of government actors, as will be seen below, but also of the complex and dynamic network of demands of society and the need for timely and innovative solutions in a scenario of fiscal constraints and constant changes in priorities.

## Institutional Enhancements

### Organizational Competences

Experience shows that in Brazil, each 4 years, there is a new structure design in the institutional organization that composes the Executive Branch. This is because, among the forms of political coordination, the institutional architecture and respective definitions of competencies portray a strategy to achieve the public end for each elected government. This institutional structure for government departments is submitted by the President, in the early days of the new presidential term, and once approved by parliament, it is detailed in decrees of regimental structure.

In the institutional structure for Brazilian Executive Branch, the crucial competences for political coordination – interfederative relations, interactions with other branches, government priorities monitoring, and norms drafting – are centered in departments of the Presidency, Civil House, Secretariat of Government, General Secretariat, and Institutional Security Office, all headed by Ministers of State. The following competences of these bodies stand out:

- Integration of government actions and monitoring ministries activities
- Coordination of new public policies formulation
- Supervision of investment public private partnership program
- Coordination of strategic infrastructure projects
- Coordination of interministerial communication and dissemination of government policies
- Supervision of state modernization programs
- Coordination of bills sent by the National Congress
- Coordination of normative acts submitted to the President of the Republic
- Monitoring of potential risk issues, prevent crises, and articulate their management in the event of a serious and imminent threat to institutional stability
- Coordination of information and communication security activities

Among the various federal public interventions, policies, services, and actions, there are different modalities (vertical and horizontal) and moments (formulation and implementation) for making this coordination, a theme explored in detail by Celina Souza (Souza 2018), and most of them are centered on the four Ministries of the Presidency.

According to Guy Peters, one of the advantages of coordinating structures linked to the Presidency or Prime Minister's office is that they tend to be more flexible and have no direct responsibility for providing services. This is because of their cross-cutting policy competencies and contradictory policies coordinating task (Peters 1998).

Despite the primary function for these four ministries – Civil House, Secretariat of Government, General Secretariat, and Institutional Security Office – in assisting the Brazilian President in producing effective vertical and horizontal coordination, it is necessary to be aware that it is not an exclusive challenge for theses departments.

Brazilian Executive Branch faces a plenty of institutions linked to a singular Minister of State – such as foundations, regulatory agencies, and public companies (so-called indirect administration bodies) – which also require a technical and political coordination role in their field.

The coordination of these indirect administration bodies and its policies is provided by a decree, which is updated according to the political guideline to a particular sector, in each presidential term, together with the law that organizes Brazilian Executive Branch structure.

Just to illustrate the plurality of federal agencies and institutions, including hospitals, universities, technical education institutes, and public companies, there are 216 federal entities linked to the Ministries of the Federal Government, as described on the Federal Decree # 9.660/2019:

- One linked to the Civil House
- One to the Secretariat of Government
- Six to the Ministry of Agriculture, Livestock, and Supply
- Eight to the Ministry of Citizenship
- Eight to the Ministry of Science, Technology, Innovations, and Communications
- Eight to the Ministry of Defense; 23 to the Ministry of Economy
- One hundred fifteen to the Ministry of Education; 15 to the Ministry of Infrastructure
- Eight to the Ministry of Regional Development
- One to the Ministry of Justice and Public Security
- Three to the Ministry of the Environment; 10 to the Ministry of Mines and Energy
- One to the Ministry of Women, Family and Human Rights
- One to the Ministry of Tourism
- One to the Ministry of Foreign Affairs
- Six to Ministry of Health

## Governance Committees

In order to ensure coherence and intragovernmental coordination, whether in the design, implementation, and evaluation of priority public policies, some committees coordinated by central ministries deserve mention to have the portrait of the functioning of the coordination of the Brazilian Public Administration.

Guy Peters reminds that citizens feel the effects of inadequate coordination in a number of ways, such as clients of malfunctioning programs as well as having difficulty in services they need from the government (Peters 1998). It is therefore necessary, as explained in detail in the Guide to Public Governance Policy of Brazil to establish a set of measures that reduces the weaknesses of less developed governance models, with less institutional maturity and allows delivering less discrepant and more connected services (Casa Civil da Presidência da República 2018).

In 2017, a new cycle of public governance transformation was introduced in Brazil, and it is worth highlighting the role of the following committees:

- **Interministerial Governance Committee (CIG)**, advisory body of the President of the Republic to drive governance policy of the federal public administration, created by Decree #9.230/2017, updated by Decree #9.901/2019
- **Budget Execution Board (JEO)**, advisory body to the President of the Republic to drive federal government's fiscal policy, with a view to balancing the management of public resources, reducing uncertainties in the economic environment and the intertemporal sustainability of public debt, created by Decree #9169/2017, updated by Decree #9.884/2019
- **Public Policy Monitoring and Evaluation Board (CMAP)**, advisory body to evaluate public policies and propose public policy changes resulting from the evaluation, created on 2016 and updated by Decree #9834/2019

### Interministerial Governance Committee – CIG

Central axis of the Federal Government horizontal coordination focused on the principles of responsiveness, better regulation, integrity, reliability,

accountability, and transparency, the Interministerial Governance Committee (CIG) aims to find solutions for crosscutting issues, ensuring policy coordination and coherence, in order to increase the responsiveness of sectoral policy-making bodies.

The board, which recommendations are documented as a legacy of Brazilian public policy drivers, gains importance not only for its composition but also for the gap it has filled in the dissemination of good federal governance practices, a role that has been taken by the external control audit office.

CIG is composed by the ministers of state of the Civil House of the Presidency of the Republic, who coordinates it, of Economy and of Federal Comptroller's Office (CGU). At its meetings held in 2018 and 2019, the CIG approved four guidelines, applicable to all federal government agencies and entities: (i) regulatory impact analysis, (ii) ex ante evaluation and (ii) ex-post for public policies, and (iv) public governance policy – as well as the guidelines for the medium and long-term strategic planning.

Note some of the guidelines of the Brazilian public governance policy:

- Direct actions toward the search for results for society, finding timely and innovative solutions to deal with budget constraints and changing priorities.
- Promote administrative simplification, modernization of public management, and integration of public services, especially those provided by electronic means.
- Monitor performance and evaluate the design, implementation, and results of priority policies and actions to ensure that strategic guidelines are observed.
- Coordinate institutions and processes to improve integration between different levels and branches of the public sector, in order to deliver public value.

## Conclusion

Coordination is a big challenge not only for the Presidency bodies to coordinate the Ministries and some contradictory sectoral policies but also for the Sectoral Ministries themselves, which, in addition to the public service mandates, coordinate and supervise plenty of entities in their area of competence.

This requires administrative and political coordination, and it is even more difficult when the Brazilian presidential system is confused with the parliamentary practice in which there is no unified political orientation in one administrative structure. In this case, the chance of effective coordination decreases exponentially, undoubtedly affecting the outcome of citizen policy and their confidence in the state. This further increase the importance of committees and arrangements detailed above, such as the Interministerial Governance Committee (CIG).

Despite all of this effort for improvement of state strategic planning and institutional arrangements to provide greater coherence and predictability for public action, the coordinating role depends also on political and administrative circumstances and, especially, on the profile of the public leaders and senior officials.

Having a strategic view of public policies and the perception of important long-term interventions is a rare attribute that, it is admittedly to say, is an indispensable factor for the institutional coordination and turns into results to society in the short, medium, and long terms.

Recall here a lesson from Guy Peters that:

> Governments have invested a lot of time and energy in trying to achieve better coordination and have various mechanisms. All of these mechanisms have some virtues, but none is a panacea. Some of these coordination mechanisms depend on more or less top-down forms of coordination, while others may occur more through individual interactions and bargaining between the actors involved. (Peters 2018)

# Policy Diffusion in Latin America

Cecilia Osorio Gonnet
Universidad Alberto Hurtado, Santiago, Chile

## Introduction

Studies about public policy diffusion address questions about political change. Among these we can find: Why different governments adopt the same type of policy? Why others do not do it? Why some innovations in policy are scattered and concentrated in a given territory? What explains the speed of a policy diffusion process? (Coêlho 2016). To answer these questions, it is assumed that the information about new policies or institutions is communicated by the members of a social system in an uncoordinated way, and where the first adoptions of an innovation affects the chances of doing so by those who have not applied it (Rogers 2004).

From the 1960s onwards, the contributions of innovation diffusion studies – such as those of Rogers (2004) – began to be applied to the field of public policy. The objective is to explain policy-making processes where several different actors formulate and design similar policies, assuming that this process is not explained exclusively by domestic variables. Therefore, it is aimed at determining the independent variables that explain an adoption (which becomes the dependent variable), as well as the mechanism that operates in this process. A dual view is adopted, which links the domestic level where the policy is applied with the regional/global where it has been disseminated.

## The Diffusion Model and Its Main Components

One of the first works on diffusion came from Jack Walker in 1969 (Berry and Berry 2007), whose objective was to develop several propositions that could be used as guides for the diffusion of innovations and applied, also, for the analysis of decision-making (Walker 1969). Its object of study was the innovation capacity in different areas by the federal states of the United States, and its questions were similar to those still carried out in the studies with this model. Among the main results, Walter outlines, indirectly, that some of the mechanisms that influence diffusion are competition and emulation among the states (Walker 1969).

Subsequently, the number of papers about policy diffusion has been increasing, the same as with the sectors studied. These make reference to the diffusion of economic, health, education,

retirement, poverty, agriculture, institutions, regulators, and environment policies among others. In general, several models are applied that have been designed to explain the diffusion (Berry and Berry 2007), starting from the innovation theories and taking a step forward when considering how diffusion occurs between different units and which are the variables that explain it. Along with the variety of areas, the diffusion model has been applied at different levels, from the municipal, regional, federal to the national level.

Since the diffusion of policies arise from the theories of diffusion of innovations, some authors work with the definition proposed by Rogers (2004) who points out that "it is the process through which an innovation, defined as an idea perceived as new, spreads via certain communication channels over time among the members of a social system" (Rogers 2004: 13). Others apply proposals such as the one given by David Strang (1991), understanding diffusion as the process in which the adoption of a practice alters the possibility of doing it for those who have not done it (Elkins and Simmons 2005). Including aspects of the above, Levi-Faur defines diffusion "as the process by which the adoption of innovation by member (s) of a social system is communicated through certain channels and over time and triggers mechanisms that increase the probability of its adoption by other members who have not yet adopted it" (Levi-Faur 2005: 23). Or, in other words, understand diffusion as a process whereby the information about new policies or institutions is communicated through certain channels in time among members of a social system in an uncoordinated way, and where the first adoptions of the innovation affect the probabilities of adoption by those who have not adopted yet (Jordana et al. 2009).

All the definitions of diffusion assume that is a process that is not due exclusively to reasons specific to the internal political process of each state, because they consider the possibility that "policy choices in one country affect the policy choices in other countries, so causing policies to converge" (Meseguer and Gilardi 2009: 528). This model then discards the possibility that countries respond independently to similar domestic conditions and that this could explain the coincidence in decision-making. It also seems unlikely that convergence will occur exclusively due to coordination among actors, through international cooperation processes or due to pressures from more powerful agents. In a sense, it is defined as a mixed position in that there is interdependence between countries over time or with a central actor who acts as a transmitter. Countries would not act in a completely independent way, but neither in a coordinated way. The diffusion process answers then to an uncoordinated interdependence (Elkins and Simmons 2005). "Under this conception, governments are independent in the sense that they make their own decisions without cooperation or coercion but interdependent in the sense that they factor in the choices of other governments" (Elkins and Simmons 2005: 35). Therefore, the studies on diffusion seek to rule out the null hypothesis that assures that national socioeconomical and political factors are the exclusive cause of change in policies.

The diffusion process can be characterized by at least three components; first, they develop in waves, starting slowly in terms of the numbers of actors adopting the initiative, increasing significantly to then decrease. This implies that, in graphic terms, the adoption rate over time will take the form of an "S" curve (Weyland 2006). Secondly, the diffusion usually presents a significant geographic convergence, in the same region or neighboring countries (Weyland 2006). Finally, generally literature assumes that a third element in diffusion is the similarity between the central characteristics of the policies but with divergence in other components (Weyland 2006).

Finally, in terms of the object of diffusion, some researchers have suggested distinguishing whether it is a model or a principle (Weyland 2006). The first refers to a diffusion of a specific policy or program that is replicated, such as the Chilean model of privatization of pensions or the Grameen Bank microcredit system. The second refers to the diffusion of a principle, a guideline that leads the decisions towards specific polices, such as central bank autonomy or the universal access to primary health services (Weyland 2006). Therefore, a new route guide is disseminated, a

key idea, but it can be imbued with institutional characteristics and diverse components. The result of this diffusion is not a pattern of change as profound and uniform as in the case of the diffusion of a model (Weyland 2006).

## The Mechanism of Diffusion

Diffusion studies also seek to understand the objective behind the adoption of a given policy and also determine how that process worked. The mechanisms of diffusion allow us to elucidate the causal relation of that decision, and if, for example, it is due to a desire for competition among states, if it seeks to emulate decisions that confer some status in the international arena, or was the product of a learning process that enabled identification of such policy as the most relevant and functional (Elkins and Simmons 2005). The literature also argues that the type of mechanism could have consequences in the quality of the policies. For example, a policy adopted by emulation may not be the most appropriate alternative to solve a specific problem (Meseguer and Gilardi 2008).

Simmons et al. (2008) distinguish four mechanisms of diffusion – coercion, emulation, competition, and learning – on which there is relative consensus, although the denominations and certain components may partially vary.

The coercion mechanism refers to the imposition of the policies of the national governments by international organizations or of more powerful and influential countries. Therefore, the convergence of policies is promoted by the dominant actors and it is a mechanism that operates vertically.

The other three mechanisms operate horizontally among the different actors and would have voluntary character. Emulations occur when "the policies are adopted by their social value, instead of its own value, looking for loyalty and status" (Osorio 2015: 34). It differs from the other mechanisms because it is based on the logic of appropriateness, where the action of adopting a policy implies the evocation of an identity or role in a specific situation rather than in the rational analysis of the domestic variables to be considered in the decision-making process (Gilardi 2012). On the other hand, the policymakers are not interested in effective policy solutions, rather in facilitating the public acceptance or viability of a policy change. So emulation, in terms of results, may not lead to an improvement or even lead to a deterioration in a given situation. It is due to the above that it is argued that emulation usually implies copying of the policy (Bender et al. 2014).

Third, there is a competition "when countries that dispute the same resources adopt the policy of their competitors through fear of economic loss" (Osorio 2015: 34). It is usually assumed that it refers exclusively to the economic sphere; however, it is possible to identify political and social competition. The first occurs when the states try to adopt the role of international leaders or early followers of a policy in order to influence in the evolution of the policy and minimize the adaptation costs. On the other hand, the second denotes a relationship of two entities towards a third one. In order to stabilize that relationship these two entities observe each other and, if necessary, they imitate each other (Bender et al. 2014).

Finally, in the mechanism of learning there is a process of knowledge of the policy in question, and as a consequence of this arises the decision for adopting it (Simmons et al. 2008). "Policies adopted in some countries turn out to be natural experiments from which others can learn" (Meseguer 2008: 323). Now, literature has made an important distinction between full or rational and limited learning. In its first version, learning improves knowledge since it implies the review of the causal links between policies and the results in the light of the observed experience and contributes to the understanding of the consequences of the policies (Meseguer 2005). Therefore, this definition contributes to distinguishing between the rational learning and the emulation or the symbolic imitation (Weyland 2004); since the latter seeks credibility, the status, or the simple conformity with the international tendencies (Meseguer 2005). On the other hand, limited learning resorts to heuristic shortcuts. "Rather than scanning all information, governments look at *relevant* information" (Meseguer 2005: 72).

The debate about the mechanisms is constant and alternatives to the aforementioned emerge.

For example, Simmons has regrouped the mechanisms distinguishing between those where the adoption by one actor alters the practice of the other (these are the conditions by which he makes his decision) and where the adoption by some gives information by which the decision in made (for example, about the advantages and disadvantages) (Simmons and Zachary 2005). On the other hand, Meseguer and Gilardi (2008, 2009) exclude coercion from the list of possible mechanisms. The verticality and the pressure exerted would condition the voluntariness in the decision.

## The Critical View of the Policy Diffusion Models and Their Mechanisms

As already noted, the policy diffusion model provides a perspective to understand the convergence among countries that adopt a policy, helping to identify the mechanism(s) that explain this process. However, some aspects in literature that can be discussed to enrich its application can be observed.

One of them is the overlap that exists between the different mechanisms of policy diffusion. The boundaries between the definition of one mechanism or another are diffuse and tend to have aspects in common that make it difficult to distinguish among them. This is a key point to consider during the interpretation and empirical testing (Meseguer and Gilardi 2009). For example, in the case of emulation, the main distinction with learning has to do with the motives, since the adoption of the policy would be due to the aspiration to imitate a country with high prestige or adopt a policy that is in fashion. Now, in spite of this, it is possible that there is in the motivation an expectation about the results of the policy that provokes certain expected consequences (Meseguer 2004); because otherwise, the decision would be completely irrational. Hence, a difficulty has to do with being able to ensure that the motivation was exclusively to emulate a particular policy. Likewise, a mechanism can be classified as learning if deep knowledge of the initiative is identified before its adoption. However, it is not possible to rule out completely that the motivation to emulate has not been present. Therefore, the idea of a 100% pure mechanism does not capture the complexity of the process and in mythological terms, it is hard to apply.

The other mechanisms, competition and coercion, are easier to identify and apply. In the case of the former, it is understood that the policies adopted would directly or indirectly affect other countries in terms of economic aspects, so the motivation would be not to be at a disadvantage. Finally, in reference to coercion, the pressure exerted by an international institution or by an influential country is possible to identify, for example, through the conditionality of a loan. However, more subtle ways of coercion could overlap with learning or emulation, which requires the definition of precise indicators.

In that approach, a tension present in the mechanisms is that they involve – although not always defined properly – two components: the means and the motivations (Osorio 2015). The attention given to one or the other varies in the diffusion studies and also according to the research methods applied. The identification of the motives and means of each one will contribute to a more precise definition of its characteristics and their indicators for their empirical observation (Osorio 2015).

Also, it is necessary to consider that different mechanisms can operate during a diffusion process and, in addition, a variety of them can be observed depending on the countries involved or according to the sector where the diffusion takes place (Jordana et al. 2009). This should avoid a homogenizing assumption, since in a process of diffusion among a group of countries, it may be the case that some adopt new policies because they learn from others, and that there are countries that do it by simple emulation or by competition (Meseguer and Gilardi 2009). In this sense, the consideration of the domestic aspects of each country opens the alternatives to observe variables of political type, such as the proximity of an election or the impact of specific institutional spheres (Meseguer and Gilardi 2009). Finally, it is a matter of continuing to clarify how national politics condition the diffusion.

Specifically regarding learning, one of the challenges is to move forward in identifying the components of the process that influence the final outcome. In that sense, what is the object of study could be distinguished; that is to say what is learned. Here Weyland's already commented distinction between the adoptions of the model or principle (Weyland 2006) is useful. Then it must also be considered that learning a principle or a model could also be the result of this mechanism and the decision made in its development; that is, it could be a consequence of *how* it was learned. Another aspect that must continue to be worked on is to define *who* the learners are. This has not been approached in detail until now by the literature and its inclusion is assumed in the same group as policymakers, technocrats, and politicians. The difference regarding their motivations and attributions could be important, differing, for example, between substantial concerns about the nature of the policy or the obtaining of electoral revenues.

Finally, when analyzing this mechanism at the level of policymakers, the question whether the learning process has been individual or collective arises. As already pointed out, the learning process of a policy can begin at an individual level and eventually could be collective learning, but not necessarily at the moment of decision-making for adopting the initiative. However, this is a point to take into account, since it has to do directly with the identification of who learns at the moment of adopting a policy.

## Studies About Cases of Diffusion in Latin America

Studies in Latin America have addressed global and regional policy diffusion processes using a variety of methodologies. Among the research are the studies carried out by Jacint Jordana, who analyzes the creation and reform period of regulatory agencies in 19 countries of the region, questioning the traditional approach and considering sectorial areas, as well as the national variations in the diffusion of regulatory authorities in Latin America (Jordana and Levi-Faur 2005). In this sense, they propose two approaches to explore the institutional transfer channels: the national approach and the sectorial policy approach (Jordana et al. 2011). This contribution considers how the transfer channels vary during the stages of the diffusion process and, at the same time, complicates the approach in the mechanisms of the transfer, considering that they could operate not only among states but also between policies sectors.

Sarah Brooks (2009) conducted an extensive study to understand the diffusion wave of Pension Fund Administrators (PFA). Her work *Social Protection and the Market in Latin America* (2009) analyzes the wave of reforms in the social welfare sphere, this is, the shift from the delivery system to the individual capitalization one. The study tries to answer the arguments that prevail at the time to privatize the system, despite the consequences that this brings and the strong opposition that is generated from the different actors.

On the other hand, it is worth mentioning the numerous studies carried out by Kurt Weyland (including from 2002, 2004, 2005, 2006 and 2014) that contribute significantly to the research about the diffusion processes, as well as the understanding of waves of diffusion of specific policies in Latin America. In *Learning from Foreign Models in Latin America Policy Reform* (2004), a series of articles are collected that address the process of diffusion of reforms in the security and welfare sector, unemployment insurance, and the health sphere. In *Bounded Rationality and Policy Diffusion: Social Sector Reform in Latin America* (2006), Weyland develops a psychological approach to decision-making, deepening and developing some of its guidelines and analyzing cases compared qualitatively. His research found that a clearly delimited form of rationality prevails in the transnational diffusion of political innovations.

Others works continue analizing specific social policies in the region. For instance, in *The diffusion of the Conditional Cash Transfer programs (CCT) in Latin America 1990–2010* (Osorio 2014) seeks to resolve which variables explain this diffusion process and the mechanisms of diffusion that are observed in the processes of adoption at a national level. The hypothesis developed

is that diffusion is explained by the existence of a consensus about the CCT generated by a regional epistemic community that is also linked with international organizations presents in Latin America. It ratifies the small role of these domestic variables as the degree of inequity and develops the role of the regional epistemic community, identifying the experts, their beliefs about the programs, their ways of influence and linking with the national processes of policy formulation.

The diffusion of CCT at a global level is studied by Brooks (2015) through a quantitative analysis in *Social Protection for the Poorest: the adoption of antipoverty Cash Transfer Programs in the Global South* (2015). The findings point out that there are more possibilities for implementing the programs with the presence of the CCT between countries of the same region (the so-called *neighbor effect* in the literature) and among democratic countries. In the domestic arena, democratization increases the probability of adopting, along with the existence of governments with ideological differences between executive and legislative branches (Brooks 2015).

Then, at national level, Natasha Borges Sugiyama, in *Diffusion of Good Government: Social sector reforms in Brazil* (2013), examines the policies behind the programs of good government and researches the forces behind its dissemination. Specifically, it focuses on local Brazilian governments and the diffusion of two social programs: Family Grant and Family Health Program (Programa Saúde da Familia) at a municipal level. The results show that the electoral incentive offers a weak explanation for the diffusion of innovative social policies (Sugiyama 2013). Therefore, the alternative explanation refers to ideology and the socialized norms at a professional level.

The work of Denilson Coêlho (2016) focuses on how the Family Health Program initiative became a model to be followed by other federal states, starting with a diffusion process inside Brazil. It focuses its attention on the adoption process of this CCT factor of a political, institutional nature and how the regional influence conditions the adoption of a program.

De Faria, in *Ideas, Knowledge and Public Policies. A succinct inventory of recent major analytical strands* (2003), studies the importance of ideas and knowledge in the public policy process. Along with it, in the work *The diffusion of social policies as a strategy of international insertion: Brazil and Venezuela compared* (2012) comparatively analyzes the way that Lula's Brazil (2003–2010) and the Chavez's Venezuela (1999–2013) tried to provide the processes of international social policy diffusion with tools that allowed them to obtain benefits in their strategies of international insertion, taking into account that both countries had the intention to exercise leadership in a regional context.

Finally, Porto de Oliveira (2016) studies the process of international diffusion of participatory financing policies. This policy was conceived in Porto Alegre in 1989 and now has innumerable iterations at international level, defining the importance of a group of actors – participation ambassadors – in the process of advocating for the definition of participatory financing policies in the global agenda.

## Conclusions

Studies regarding the diffusion of public policies constitute a consolidated analysis perspective that contributes to understanding the diffusion processes of policies that may occur within a country or at regional or global level. At domestic level, for example, it is considered that variables such as the type of political regime, institutions and their characteristics, the gross domestic product, and government ideologies could explain the decision as to whether to adopt a particular policy or not. At an external level, the presence of the so-called neighbor effect, the link to loans of the multilateral banks, the incidence of economic crises, the expert influence of epistemic communities, and advocacy coalitions or international organizations are usually assumed.

These variables are tested through diverse methodologies. There is some consensus about the advantages of complementing quantitative analyzes at macro level – either state, regional,

or global – that allows us to test the variables and deepen their incidence. Then, the detailed look at how these variables affect and operate in the decision-making process should be studied by case or comparative case analysis, which will enable us to advance with the questions concerning *how* and *what* is adopted.

# Policy Entrepreneurs as Bureaucrats, Merging Formality and Informality

Petra Svensson
Halmstad University, Halmstad, Sweden

## Synonyms

Turning entrepreneurial behavior into formal bureaucrat positions

## Definitions

*Policy entrepreneurs* refer to actors in the public sector organization advocating for proposals or ideas. *Bureaucrats* refer to the Weberian ideal of neutral public administrators. Here, *merging formality and informality* in this setting refers to the establishment of formal positions in the public sector organization on which the employed administrators have the task of acting as a policy entrepreneur.

## Introduction

Currently, when complex boundary spanning challenges such as sustainability, resilience, and social inclusion are at the table, the actors working for policy change have rendered more attention. These actors are often referred to as "policy entrepreneurs." This entry presents a specific version of the policy entrepreneur, namely, the policy entrepreneur who is employed as public administrator or bureaucrat in the political-administration with the task to promote, coordinate, and integrate complex policy areas with other policy area.

Policy entrepreneurs work actively to promote and advocate for policies and ideas and are not limited by any formal structures. Instead they apply what could be considered informal elements: personality, strategy, networks, and contacts to achieve policy change (Kingdon 1984/2003; Mintrom and Norman 2009). In studies of policy entrepreneurs and policy entrepreneurship, focus has generally been on who they are and what they do, that is, what personality traits that characterize them and what action do they take to gain influence. These informal characteristics have been carefully and fruitfully assessed. However, as the policy entrepreneurs' personality traits and their action are increasingly considered important assets to tackle the contemporary complex policy problems, there is a tendency to employ policy entrepreneurs as public administrators in the political-administrative organization with the task to promote and coordinate these policy problems. These entrepreneurial public administrators hold titles such as "strategists," "coordinators," and "developers," and can be found in all tires of government: national, regional, and local.

Here, I argue that the establishment of these positions can be considered an expression for a desire to formalize the policy entrepreneurship into the public administration and merging the informal action and behavior of policy entrepreneurs with the formal structures in the public sector. By doing so, the policy entrepreneurs employed as public administrators are faced with two contradictive logics of expectations: they are employed to work proactively as policy entrepreneurs which means applying informal skills and capacities, while their positions as public administrators are based on the logic of formal bureaucracy. Thus, the positions of employed policy entrepreneurs are characterized by "formal informality."

Some reservations should be made; the conclusion in the entry rests upon ten years consecutive studies of cross-sectional work in the Swedish political-administrative system. The overall conceptual conclusions regarding the relationship between formal and informal organization of policy entrepreneurship could most possibly be translated to other contexts; however, it is also possible that specific contextual characteristics will cause variations in the practical expression of these relationships.

The formalization of policy entrepreneur positions is a part of an ongoing development and debate on how to organize and govern the

public sector. The relationship between formal and informal elements is constantly negotiated and reformed, and every organization, public and others, holds both informal and formal elements. Formal elements consist of explicit rules, structures, and division of responsibilities and tasks, whereas informal elements consist of the activities taking place along and between the formal structures. The informal activities are based on relations, interaction, and are dependent on and shaped by the personalities of the actors participating. They are important, because they contribute to cooperation and flexibility, whereas the formal elements create a structure for accountability and efficient organization. (Lundquist 2011: 81; Morand 1995: 834; Misztal 2005; Hrelja et al. 2017). During certain periods, the formal elements are stressed as key to tackle societal challenges, and during others, the informal elements are considered the solution. These different approaches to public sector governance also hold various perceptions of how to make best use of the bureaucrats working in the public sector, that is, the public administrators.

In this entry, this establishment of bureaucrat positions with policy entrepreneurship tasks is elaborated upon in light of its merging of formality and informality.

## Solving Problems with Formality and Informality

The formal and informal elements are strongly intertwined, but the formal structure constitutes the foundation of how we perceive the ideal and democratic public organization: as a neutral machinery which treats everyone equally and efficiently, impersonally applies expert knowledge to execute the political decisions, and keeps the roles between bureaucrats and politicians clear and separated. This classic idea of the public administrator is inspired from Weber's concept of separated roles, where the politicians decide and the bureaucrats execute. This separation of roles was stressed also during the primetime of New Public Management during the 1980s, 1990s, and 2000s, in order to "let the managers manage," without too much interference from politicians (Stout 2013).

Although formality and clear separation of roles is a highly institutionalized image of how the political-administrative relationships should be organized, we can discern variations. These variations are connected to societal challenges, and how we perceive the problems and solutions of these challenges. Throughout the last 150 years, we have seen the rise of the Weberian ideal of bureaucracy to increase democracy, the problematization of machine-like bureaucracies in the post-war time, inspiration from the market-focused private sector during the 1980s, 1990s, and early 2000s to increase efficiency, and the current attempts of networks and public value governance to find a new route for the public organization in the age of sustainability and governance of complex problems (Stoker 2006; Stout 2013; Svensson 2019b). Thus, one question is what are the characteristics of the challenges leading to formalized policy entrepreneurship?

### Which Problems

The short answer to the question of which problems are approached with formalized policy entrepreneurship is that all policies and problems that are "wicked" can become the object of formalized policy entrepreneurship. "Wicked issues" has become an accepted term when describing policy areas that have no clear definitions and agreement of the problem and no method to estimate when the problem is solved, thus creating a space where the planner of the policy area will have a high level of discretion (Rittel and Webber 1973; Weber and Khademian 2008). This situation, and the discretional strategic space it creates, is likely to pave way for policy entrepreneurs.

However, the formalization of policy entrepreneurship is not only a direct effect of the challenges the political-administration is facing. I argue that the formalization of policy entrepreneurship and the increasing number of formal policy entrepreneurs in the political-administrative organization also can be considered a reaction to an increased tendency to define policy areas as wicked and in the need of strategic

governance. That is, we do not only increasingly recognize that problems are wicked, but we have also to a higher extent start to look for wickedness and complexity in problems as a part of their governance, resulting in pushing them toward the strategic level of the administrative organization (see Kornberger 2012). The difference may seem irrelevant but is crucial when trying to specify the situations in which we will find the formal policy entrepreneurs; they will not only be found in the governance of classical wicked problems, such as sustainability, public health, and social inclusion. They are also likely to be found in other policy areas, which have been influenced by the "wicked problems" governance. The focus here is not to establish which policy areas that are or are not truly wicked, but to discuss how the framing of problems and policy areas can result in the application of formalized policy entrepreneurship as a governance tool.

Thus, the main factor, which is argued to result in formalized policy entrepreneurship, is whether a policy area is framed as in need of strategic governance due to its complex nature. Another, but related factor most likely resulting in formalized policy entrepreneurship, is that the perceived complexity is not only related to the how the specific policy area or problem is defined but also due to it being perceived as connected to, and integrated in, other policy areas (Svensson 2019a; Olausson and Svensson 2019). A policy area may be considered complex, but still as a defined policy area of its own, making it less likely to be the object of formalized policy entrepreneurship. Defined policy boundaries make it easier for the existing organization to address the complexity. It is also possible that a policy area is considered uncomplex (i.e., clear in its definition of problem and solution) but in the need of integration in other policy areas, also making it less likely to be the object of formalized policy entrepreneurship. Policy integration is easily done with uncomplex policy areas where the breaking points between them are more clearly defined.

To conclude which policy areas that are likely to become object of formalized policy entrepreneurship, that is, in which we will most likely find the public administrators with the formal task of acting as policy entrepreneurs: a perceived level of both high complexity and perceived high need of policy integration is likely to create a situation where the policy area is pushed toward the strategic level of the organization, and where the formal policy entrepreneur is considered a useful asset.

## Why Policy Entrepreneurship

Why then is policy entrepreneurship in the above situations considered such a useful asset that there are active attempts to institutionalize it by formalizing it into the organization? Here, four main reasons are presented.

Firstly, the formal policy entrepreneurs are generally expected to invent new solutions to the complex problems. They are employed because of their entrepreneurial personalities and "out-of-the-box"-thinking, and are requested to apply these informal personal features on their administrator positions. If they are working close to the policy level and have the ear of top managers and politicians, it can have rather extensive impact of the overall governance. If they apply this informal entrepreneurial skill more as practical problem solving, it can take the shape of networking for resources for specific projects and activities designated to contribute to problem-solving (Svensson 2019a).

Secondly, formal policy entrepreneurs are employed because the policy areas that are defined as complex often are also defined as something that needs to be safeguarded in the organization as a part of the overall code of conduct, public value, and moral backbone of society. In this category, we find policy areas such as sustainability and human rights. In this safeguarding, another aspect of entrepreneurship comes in handy, namely, the commitment to the problem or policy area. It is possible to be a formal policy entrepreneur without having a personal commitment. Generally, however, the formal policy entrepreneurs show strong interest in their policy areas, are often engaged in it also on a personal level, and are asked to bring their commitment to their formal positions. This commitment and the request for it tells us that there is an expectation that the problems becoming object of formal policy entrepreneurship benefit from personal and

informal commitment. This can be contrasted with the classical Weberian bureaucrat or the strong professions in the public sector, such as social workers and healthcare personnel, who are asked to leave their personal commitment outside their vocation in order to perform it according to neutral and professional standards (see Stout 2013).

Thirdly, formal policy entrepreneurs are generally expected to discern breaking points and overlaps between policy areas, and to connect actors representing them. When doing so, they look for similarities in problem definition and in approaches to solutions. This entrepreneurial skill can be referred to as framing (Aukes et al. 2017). This framing is done in order to solve or at least ease the complexity of integrating many policy areas with each other. When interviewing formal policy entrepreneurs, the undogmatic and informal flexibility to understand and handle that one policy area that can be addressed under different labels is mentioned as one of the most applied and useful skills. They also mention, in somewhat more subtle terms, that framing can be a useful way to pave the way for the policy area they are employed to promote. By framing it differently in different contexts, they reach the ear and possibly the resources of more people (Svensson 2017).

Fourthly, the formal policy entrepreneurs are generally expected to contribute to the pushing of a policy area toward the strategic level. This is expressed in terms of a reluctance both from formal policy entrepreneurs themselves and from their organizations to engage the formal policy entrepreneurs in operative work. Most of them expressed it clearly: "I am not allowed to take a more operative role, and I also do not want to." As mentioned, the policy areas where we find formal policy entrepreneurs are characterized by being perceived as highly complex and in the need of policy integration to be solved. Policy integration is defined as something other than coordination; focus is not only on encompassing the separate goals of different policies but exceeding them into something coherent where the whole is bigger than the sum of its parts It has been argued that achieving this level of integration requires careful strategic consideration in all units and on all levels of the public administration (Cejudo and Michel 2017). This focus on strategic governance of complex problems is likely to cause a move where more and more policy areas will be pushed toward the strategic level, especially if there are a simultaneously increasing number of problems defined as complex or "wicked" (see Kornberger 2012). Formal policy entrepreneurs are often considered a useful tool for policy integration, due to the expectation that they hold the skill to make strategic decisions. They are often expected and themselves focused on using informal methods to "make others do things" as a part of integrating one complex cross-sectional problem into other policy areas (Svensson 2019a). This preferred character of formal policy entrepreneurial work is therefore likely to contribute to more and more policy areas becoming defined as strategic.

## Contradictions of Formalized Policy Entrepreneurship

As seen above, there are many reasons to employ formal policy entrepreneurs in the political-administrative organization. They can be summarized by the statement that the establishment of formal policy entrepreneur positions constitutes a governance tool to meet an increased perception of complexity in the public sector, by applying informal behavior. However, they are employed as bureaucrats in the public sector, and thus must appeal to both the logic of informal entrepreneurial behavior and of the formal rules of the public organization and the role of the bureaucrat in it. This sometimes leads to clashes between logics.

When the formal policy entrepreneurs are applying their informal entrepreneurial skills in a direct way, to generate resources, start projects and influence decisions they are true to their entrepreneurial form. This form also holds a direct clash to the formal bureaucrat role. In order to be successful, it either requires a forgiving surrounding, a high level of legitimacy, or a certain level of invisibility. The same kind of clash can occur

when the formal policy entrepreneur is highly committed and takes the role of an activist in the organization. It may work out, depending on the situation, but since the lion's share of the formal policy entrepreneur's work is based on the informal entrepreneurial logic which clashes with the formal rules of the organization, it is hard to fully institutionalize these aspects and make them impersonal (see Stout 2013).

When the formal policy entrepreneurs work for policy integration by looking for overlaps and similar definitions, they have a higher degree of formality to their work. The policy areas that the formal policy entrepreneurs work to integrate generally rest on some form of political decision on policy integration, hence rendering them some formal legitimacy, and an idea of formal institutionalization which is not directly bound by who is working on them. However, due to the formal policy entrepreneurs' awareness that their work is not only about finding integration points but also about safeguarding their own policy area in the competition with others, they apply informal logics to their framing as well in order to get resources and ears to their own specific policy area.

It can be argued that the formal policy entrepreneurs are policy tools in that they are expected to promote, coordinate, and integrate problems with each other. However, it can also be argued that when one part of this promotion, coordination, and integration is to push toward strategic governance, there is an embedded risk of policy competition on the strategic level, if simultaneously, more and more policy areas are defined as complex and being in need of policy integration.

This competition can in turn increase the perception of complexity and need of integration, leading to a self-reinforcing or "locked-in" complexity, solving complexity with complexity. Simply put, the formalized policy entrepreneurs may end up as tools to solve a complexity that they are also contributing to, by doing what their formal positions ask them to do, using their formal informality to both diminish and increase complexity by simultaneous integration and competition.

## Conclusion

The potential contradictions of combining formality and informality is related both to expectations of the organization and to the choices of the formal policy entrepreneurs. Some organizations, especially small ones, can function rather well with a higher degree of informality, whereas others do not appreciate informal action in the same way. The same goes for the formal policy entrepreneurs: some consider the best part of their job to be the informal aspects, whereas others appreciate their jobs when they get to work toward more formality and be more of classical formal bureaucrats.

To conclude the discussion above: employing formal entrepreneurs as bureaucrats to integrate the advantages of informal policy entrepreneurial behavior into the formal political-administration can be both a fruitful and a risky endeavor.

It can be risky for the organization; if the informal competition between various complex policy areas is strong, the organization will be met with lots contradicting demands on policy integration. This can lead to resistance and fatigue. In short, is it possible to integrate everything with everything, without losing the specificity of the original problem or area of expertise? This is also a relevant question in relation to the classical profession-based parts of the public administration, in which many of the complex policy areas are expected to be integrated.

It can be risky for commitment to the complex policy areas: constant framing and reframing, which is the formal method applied to create a cohesive policy integration and the informal method to generate resources for specific complex problems, leads to hiding and covering of policy conflicts within and between the complex policy areas. In the short run, this may not seem as a big risk. However, if we consider democracy as built on the idea of a capacity to handle various points of view, this conflict-diminishing, especially within policy areas such as human rights and sustainability, may have far-reaching effects.

Finally, the combination of formality and informality may also be somewhat risky for the formal policy entrepreneurs themselves: they

generally apply to these positions out of a genuine interest and commitment to their policy area, and because of their informal networks. They are also employed based in these aspects, since the public organization wants these actors specifically because of their informal characteristics. However, when actually performing policy entrepreneurial work, the formal policy entrepreneurs are faced not only with the expectations of filling their positions with the informal entrepreneurial work but also to adjust to an organization resting on a distinct formal logic. These contradictive expectations can be rather demanding to deal with on an individual level, especially if the political-administrative organization is not clear about what they want from their formal policy entrepreneurs on their bureaucrat positions.

# Policy Evaluation, Brazil

Rosana de Freitas Boullosa
Department of Public Policy Management, University of Brasilia (UnB), Brasília, Brazil

## Introduction: Unraveling the Polysemy Around Policy Evaluation

There are different paths to understand evaluation or evaluation processes in public policies. In common, however, we can say that all paths lead to the production of a very specific type of knowledge: evaluative knowledge. Thus, discussing the nature of "knowledge" can be a good starting point for us to delve into evaluation. This is because it can help us problematize its definition within a multidisciplinary field of studies and practices, considering its different possibilities of configuration and representation, which includes the main epistemological disputes that we find behind its polysemy, its method disagreements, the dynamics behind the construction of publics,

as well as its traditional formative logics. All these elements, among others, can help us to understand the social context of the evaluative knowledge production, which is increasingly gaining ground not only in the processes of governing and of governance – in different scales of performance, public action, university education and training – but also in other social contexts regarding the wide range of public, societal or private decision-making processes.

At first, therefore, when the nature of "evaluative knowledge" is seen as a posteriori*, situated and eminently empirical,* it generally means that its production is more directly associated with a framework of answers around functional questions or applied toward the construction of a methodological answer to a very specific demand of knowledge production, often regarding a well-defined object. Taking "evaluative knowledge" in this sense means to concentrate the research efforts in the definition of its own object, in the accuracy of its objectives, in the explanation of its methodological path, of its techniques of construction and selection of research materials, in the explanation of which were the publics involved in its construction, and, of course, in the presentation of its results, including in terms of evaluative judgment. It often means defining the boundaries of evaluative work itself, but much more in methodological rather than epistemological terms – a choice that is often based on the ideas of objectifying reality and of a desired neutrality of evaluation and its processes.

Unlike the previous approach, when the nature of evaluative knowledge is seen as a priori*, universal and eminently normative,* we can broadly say that evaluation assumes a concern with the meanings of the concept of evaluation itself in a more direct way, including its epistemological anchors, the understanding of science, the normative coherence of its methodological frameworks, as well as the understanding of its purposes and the explanation of its interests and preferences. It also reflects its connection with different fields of study. This is because depending on the field to which one sees him/herself attached – might it be the field of Economy, Sociology, Public Administration, Anthropology or Public Policy, for instance – the evaluation process and the knowledge produced might imply in very different sets of knowledge and perspectives. In addition, when this same nature attributes a reflective dimension to the evaluative knowledge, it is possible to observe that the notion of learning can acquire some centrality in the evaluation and in its processes. In this case, we would be facing experiences of evaluation that, when problematized as partial, also bring to the table questions of value, together with a more subjective understanding of reality than in the previous approach.

This first approach to the universe of evaluation through the notion of "evaluative knowledge," although not sufficient to understand the plurality of the current universe of theories and practices in policy evaluation, helps us to acknowledge the existence of countless disputes over different points of view, perspectives, and narratives within the policy evaluation universe. Or to be more precise: value-based disputes, taking place in different levels, whether that of ontology, epistemology, methodology, or deontology. To better understand these differences, we shall first understand this universe as a field of studies and practices, inspired by Bourdieu's idea of a scientific field – a space structured by symbolic disputes and positions of power, which would create their own legitimization structures of truths, grammars, and practices considered possible, through the notions of *habitus* and *agent* (Bourdieu 1976). So, if evaluation were a field, what would it be like? How to understand the polysemy around evaluation? Are there questions lying on the ontological level? How did we arrive at such an entangled construction, including so many epistemological and methodological matrices? And what effects does it have on the field itself? What about the agents, how would they behave in the deontological level? Moreover, what general movements could we expect in this so-called policy evaluation field, including those related to reflexivity?

In order to shed some light on these and on other issues, this entry is structured in six parts, including this brief introduction. The second part focuses on problematizing evaluation as a field of studies and practices; the third seeks to present a

brief overview of the main classificatory efforts in the field; the fourth part seeks to offer its own path to such understanding, from an epistemological point of view; the following presents some brief words on meta-evaluation and monitoring; and the entry ends with a brief conclusion on a possible work agenda for this developing field.

## Policy Evaluation as a *Field*

In order to see policy evaluation as a field, one must assume that it has sufficient critical mass to consider that its internal variations, its symbolic disputes, and the positions of power within it have been built over time. In other words, it means attributing importance to the historical perspective in order to understand the current configuration of what we are considering as a field, taking into account that this plurality is a result of a development process of almost a century of life, if we consider – along with other authors – the New Deal as a milestone of evaluation, mainly regarding the governmental sphere. Authors who dedicate themselves to the reconstruction of the history of policy evaluation as a field are increasingly rare, even if we consider those who do not call it this way. Nevertheless, we will try to reflect over their contributions, but not without one following proviso: we must take into consideration that, probably due to the applied tradition of knowledge production in this field, a large part of the efforts of historical interpretation that we have been following up through the years also carried with it the task of defending one of the types proposed in the classification at the expense of others. In other words, the classifications were often the result of historically situated perspectives, aiming at "showing" the gaps and vices of the past and pointing to new winds of change. Let us now resume the authors, by starting with the most commonly cited ones, when we seek for references on the history of the field development.

The North Americans Peter H. Rossi and James D. Wright (1984) are among the first authors who seek to interpret evaluation as a field of study, in historical and conceptual terms. For them, the decades preceding the 1960s constitute a period of growth and recognition of the importance of evaluation, particularly for the world of public and governmental decisions, which is evidently related to decision-making theories. But it was only between the 1960s and the early 1970s (particularly driven by the Great Society Programs) that evaluation has reached what they call its "golden age." An age marked by the primacy of the randomized, controlled experimental paradigm, which would have given us results very close to zero, according to such authors. This supremacy would have only come to an end with the approach of the Reagan Era and with the development of comprehensive evaluations, which were defended by them and characterized not only for constructing dichotomous judgments but also for explaining the dynamics of the development of evaluative objects and the reasons attached to such dynamics.

Two other US authors, Egon Guba e Yvonna Lincoln (1989), while focusing their efforts on the reality of the United States, proposed that the idea of generations could better explain the development of evaluative studies than, for example, a division by methods. Thus, this pair of authors identified four generations of evaluations: a first one that emerged in the context of the New Deal and was characterized by an eminently technical bias, based on the idea of measurement, avoiding even the issuing of an evaluative judgment. The second generation, named as "descriptive," was predominant until the mid-1960s and it widened the focus concerning the evaluated object in relation to the previous one. The next generation, in turn, strongly incorporated the judgment function, but without leaving behind the idea of technicality and functionalized description of the evaluative problem. And, finally, a fourth generation that started with the Regan Era and that could be considered a "reactive" one. Guba and Lincoln (1989) not only included themselves in this generation but they also defended that it represented a profound change in the evaluative practice, mainly because it responds to the dilemmas and failures of previous generations based on the constructivist paradigm. Among such dilemmas and failures, it can be cited: the supremacy of the managerial approach and of quantitative methods;

the difficulty in considering "contexts" in their research frameworks; the difficulty in dealing with the pluralism of values; and, also, the fact that they divest the evaluator of moral and ethical responsibilities.

There are, however, other ways of explaining the field development. Aligned with Rosana F. Boullosa (2018), and Rosana Boullosa and Janaina L. P. Peres (2020), both Brazilian authors, we will here consider a historical evolution that comes closer to our days and that can be characterized by five cumulative phases, which strive to broaden the look far beyond the US experience. The first phase – which is partly consistent with that of Guba and Lincoln (1989) for considering the New Deal as an important start point – is characterized by a common understanding of that time: the desired new cycle of economic development would only be possible if guided by a linear-sequential rationality of public decisions, supposedly neutral or unbiased and without a final conclusion in the form of an evaluative judgment or an evaluative summary, since the judgment function would be limited to the managers and not to the evaluators. Over the course of time, these evaluations began to become more extensive and descriptive, including endless reports and undeniable difficulties regarding the construction and exposition of evaluative synthesis on the part of those reading them. Until then, this was a movement that was restricted almost exclusively to the United States and, nowadays, it is only supported in very restricted groups of action, even though it has nurtured some epistemologies based on a managerial matrix.

With the end of the Second World War (1939–1945), this first aseptic overview of evaluation began to change very quickly, reaching a second phase. Politically, the idea of a mutually dependent global world reorganized relations between countries. Development and cooperation projects, such as the Marshall Plan (1948–1952) – dedicated to the reconstruction of a part of Europe, under the leadership and financing of the United States – created a context that allowed the notion of evaluation – understood as a subsidy to rational decision – to cross its first geographical borders, starting in Europe. In this expansion process, however, evaluations began to extrapolate their initial possibilities of use and starting to formulate judgments to subsidize public and governmental decisions more directly.

The impulse to abandon a purely descriptive nature and to assume a strongly prescriptive one came, initially, with Harold Lasswell's approach to the *policy studies*, due to its pragmatist inspiration, and, soon after, to the rapprochement with analytical philosophy in the following decade, which coincides with what Rossi and Wright (1984) called the golden age of evaluation. From an epistemological and methodological point of view, some roots were deepened, concerning the positivist tradition, the top-down paradigm of State action, the prevalence of the macro scale (for investigations of empirical nature), and the clear primacy of the scientific-experimental method. These constructions have a captive public until today, feeding different evaluative approaches.

The "golden years," however, ended up succumbing to the criticism brought by the counterculture movement in the scientific production, responsible for showing the perverse effects of an excess of optimism. Specifically in the field of evaluation, those years unraveled a certain myopia concerning the evaluation objects and the overvaluing of both the manager and the evaluator. We are facing a changing world, with a strong critical movement that brings to the forefront discussions on the pillars of the rationalist and positivist construction of science (Fischer 2003). In the evaluation field, this same positivism – one of an empiricist tradition – began to quickly lose strength and, as a consequence, new experiences of bottom-up methodologies (Albaek 1998) began to emerge, particularly those that reinforce social participation and social empowerment perspectives.

This third phase, which began to gain momentum in the 1970s, was built on the basis of a reaction to the previous phase and is characterized by the search for new epistemological grounds for evaluation, beyond the prevailing positivism, which ruled practically alone until then. At this stage, evaluations began to arrive – albeit timidly – in Latin America and Africa, often through the

hands of international cooperation, reacting both in the direction of passive acceptance and, with less emphasis, of the critical response that reinforced the ideas of local empowerment. These new searches grew stronger throughout the 1970s and entered the following decade producing new approaches aligned mainly with constructivism and hermeneutics, with periods of greater or lesser fertility that last until today.

In the 1980s, however, we also witnessed an upturn of the positivist tradition, this time in line with a new understanding of the State, its structure, and its roles. Along with the New Public Management movement and the scarcity of resources, in a world that was trying to survive the strong oil crisis, we were facing a reformist movement of the national states, based on the idea that they would have to learn how to improve their performances in terms of effectiveness and efficiency, taking lessons from the private initiative (Osborne and Gaebler 1992). These ideas fueled many administrative reforms, initially in countries such as the United States, England, and New Zealand, and later reaching some Latin American countries, such as Brazil, Mexico, Chile, and Argentina, which were already under the control of the so-called Washington Consensus (Williamson 1989), as would also happen with some African countries under the Structural Adjustment Programs of the World Bank.

In this context, evaluation heavily entered Latin America, as a management tool linked to State reforms, associated with the new managerialism and the notions of result-orientation, flexibility, and accountability (Bozzi 2001; Faria 2005). And in all these experiences, more or less intensely, evaluation was seen as an important tool for controlling the reform processes, in some cases inaugurating the very entry to these countries. In this new context, evaluation, in addition to returning to its more positivist facet, started to assume different roles related to the reduction of State administrative structures, to the improvement of its results, to the strengthening of its capacity to compete, and, of course, to the accountability of decision-makers.

The 2000s thus began with the accumulation of these different phases, shaping an increasingly dense and plural arena, both in the epistemological and methodological levels. Although the views more aligned to the depoliticized managerialism of the 1980s till prevail, there is some space for searches aligned with the criticisms of the 1970s, as well as with new critical anchors in different parts of the world. These movements can be seen as a result, at least partially, of efforts made in different parts of the world to set up more and more national associations of evaluators, such as in the United Kingdom (1994), Germany (1997), Italy (1997), France (1999), Japan (2000), India (2002), Senegal (2002), South Africa (2002), Argentina (2005), Madagascar (2004), Philippines (2007), Brazil (2008), Slovenia (2008), Georgia (2008), Ecuador (2014), Mexico (2014), and Russia (2014), many of them following the pioneering models of Canada (1981), the United States (1986), and Australia (1987).

In this global interweaving movement, we have also witnessed great efforts to build regional networks based on national ones, such as Afrea/Africa (1999), EES/Europe (1996), ReLAC/Latin America and the Caribbean (2013), and APEA/Asia-Pacific (2012). They are huge organizations that need to deal with different traditions in policy evaluation, almost never anchored in the same disciplinary fields and facing internal disputes, in addition to the obvious variety of network densities, contexts, languages, among many other elements. Even with so many differences, we have recently seen a growing presence of evaluations in contexts involving public decisions, whether inside or outside governments. And, undoubtedly, one of the great achievements of this movement has been the global campaign Eval4Action, activated by the United Nations for this decade (United Nations 2020).

## Covering the Most Significant Classificatory Efforts

After understanding a little better the history of the construction of policy evaluation as a field, it is important to cover its current configuration. During the construction of policy evaluation as a field,

some authors dedicated themselves to understanding and to classifying the growing diversity perceived so far. These classificatory efforts are important, because, on the one hand, they help scholars and practitioners to carry out an important positioning exercise in disputes involving the field; on the other hand, they end up encouraging some field agents to boost one of the sides that appear in the classifications, reinforcing and stimulating disputes that are fundamental in the knowledge expansion and in the formation of their agents' *habitus*, helping in the validation of their value structures.

Among these authors, it is worth starting with the Australian Michael Scriven (1967), for whom evaluations could be classified as formative or summative, regardless of other characteristics. The summative ones are those often subsequent to the fact to be evaluated, and therefore, *ex-post*. They seek to answer evaluative questions about continuity, closure, expansion, or adoption of their own evaluated objects (i.e., policies, projects, programs, actions), as long as these objects have already achieved some results at all; the other kind – formative evaluations – is understood as a set of evaluations seeking to produce evaluative knowledge aimed at the development of the object under evaluation, which need not, therefore, have started to produce results yet, and which are almost always directed to the team involved with the management of such objects that might be under evaluation. In the first case, from the point of view of the method, there is a greater inclination towards the use of larger sample universes than in the second case.

Scriven's classificatory perspective gained new possibilities in the hands of different authors. The US author Marvin C. Alkin (1985) was a pioneer in proposing a classification of possible evaluation uses, based on a list of variables that considered human factors, contextual factors, and factors of the evaluation itself. Soon afterwards, the also American Carol Weiss started to interpret it from the very notion of use (instrumental, symbolic, and enlightening) proposing the idea that evaluations should build a Program Theory (Weiss 1972, 1994). Still according to her, the instrumental use would be the most difficult one because of the obstacles of intellectual-cognitive and social-structural types, suggesting some ways for evaluators to increase the potential use of their evaluations. Other authors, with relatively minor influence on this specialized literature, also presented classificatory views such as that of the German Hans-Ulric Derlien (2001), who proposed the functions of information, reallocation, and legitimation. Here, it is also necessary to mention the American Michael Q. Patton, who not only uses the idea of classification departing from the notion of use (Patton 1988) but develops his own approach in this direction (Patton 1997).

Also worth mentioning is the interesting distinction proposed by Marvin C. Alkin and Christina A. Christie (2004), called "evaluation theory tree," in which they propose a metaphorical drawing of a tree with three main branches. The first of these would house all the evaluations that explain themselves through the notion of use, bringing together authors such as Daniel Stufflebeam, Michel Patton, Marvin Alkin, and Jean King, with some small variations. The second branch would bring together the efforts that are defined more as methodological, with many important names such as Carol Weiss, Shen, Thomas Cook, Peter Rossi, and Donald Campbel. Finally, a third branch – that they call "valuing" – brings together authors such as Michael Scriven, Egon Guba and Lincoln, Robert Stake, and Ernest House. The common root would be the senses of accountability and control, as well as of social inquiry.

Different classificatory efforts were also undertaken by other authors, as is the case of the Italian Claudio Bezzi (2007), who classifies evaluations as to their purposes. For him, evaluations can be simply aimed at informing decision-makers about the programs they develop, almost always from functionalist approaches to specific demands; aimed at offering a professional judgment, with the presentation of a summary in which the evaluators expose their findings and seek to answer to more concrete questions from their claimants, instead of limiting themselves to providing data, as in the first case; or, also, geared towards responding to more symbolic demands, almost always situated on the political plane of the

objects evaluated, such as governments' accountability, public accounts' transparency, confirmation of governments' priorities, and so on.

There are also classifications that assume only one element of evaluations, as is the case of classifications according to the position of the evaluator in relation to the object evaluated, which could be "internal," "external," "mixed," or, for some authors, "participatory." For each of these positions, the related advantages and disadvantages can be discussed. Other classifications, in turn, assume only a set of methodological paths as a dividing line, as is the case of the classification between "managerial evaluations," geared towards management, or "non-managerial evaluations," which would comprise the entire plural universe not contained in the first case. There are still classifications as to the timing of the evaluation, according to the life-cycle of the evaluated object. In this case, the evaluations can happen before, during, or after a "concrete fact." For those prior to the fact (*ex-ante*), we can talk about diagnoses, feasibility evaluation, public problems evaluation, scenario evaluation, preference or opinion evaluation, among others; those that happen during the existence of the fact (*in-itineri*) we can be generically named as implementation evaluations, management evaluation, instrumental evaluation, among others; and those that happen after the fact (*ex-post*) can be broadly defined as results evaluation, impact evaluation, effects evaluation, among many other possible names.

Evaluations can also be classified based on its traditions of knowledge – being of realistic or naturalistic ontology. In the first case, of a positivist matrix, the mission of the evaluator (preferably external) is to explain the object evaluated, because, in this ontology, the role of science is to discover the laws (truths) that govern the world (reality). According to this tradition, the truth is always objective and exists concretely, regardless the observer, which explains – for those affiliated to this tradition – that the evaluation must always be impartial, neutral, and methodologically based on the control of the variables to reach the heart of the truth. In turn, in the naturalistic ontology, one of a constructivist matrix, the mission of the evaluator (preferably internal) is to understand the object evaluated, because, in this ontology, the role of science is to understand the world, its parts, always in an approximate way. In this tradition, the truth is always subjective, temporary, situated and dependent on the observer, which explains – for those affiliated to this tradition – that evaluations must be part of the world of the observer and of the observed (thus, not neutral) and methodologically based on the hermeneutic and interactional approaches.

## A New Classification According to Epistemology

The existing classifications are very useful for exploring, from different angles, the variety of evaluative paths that we cover or that we come across, while looking at reports, articles, notebooks, and other media. Therefore, it is worth the effort to fit what we have in our hands or before our eyes in these different possibilities described in the previous section. However, most of them end up telling us much more about evaluations when we take the evaluative knowledge as one that has a posteriori nature – situated and eminently empirical – than when we do it from a different understanding, considering its nature as a priori, universal, and eminently normative. Confronted with this second case, it might seem that we are facing a certain gap, which leads us not only to call for the importance of new evaluative studies but also to risk ourselves in this important field, yet to be better occupied. And, again, we will do it by drawing inspiration from the studies of Boullosa (2018, 2020), Boullosa et al. (in press), and Boullosa and Peres (2020), shifting, however, the centrality of the discussion from the methodological level to a proposal of intersection between the ontological and the epistemological levels.

In this attempt to interpret the current configuration of policy evaluation as an increasingly dense and plural field, the suggested crossing leads us to the proposition of thinking by means of "*schools of thought*" that dispute the field in its different shades, symbolic systems, value

frameworks, power structures, including regarding the ability to reflect on oneself and on the field, grammars of action, admissible behaviors for its agents, conceptual frameworks, methodological definitions, including those with regard to the possible locus for empirical research, among many other elements. Thinking by means of "schools" is to deal with the different possibilities in which evaluation can be also related to other fields of study, beyond the evaluation field itself. But here, by analytical force, we are implicated in the field of policy studies, aiming at interpreting evaluation as a proper field through the following schools of thought: (i) scientific-experimental, (ii) managerial, (iii) anthropological, (iv) participatory, and (v) axiological.

The scientific-experimental school of thought, following a positivist and linear-sequential matrix, assumes that the notion of reality is the most objective possible, defending the complete dissociation between facts and values – which is the same as saying that facts exist as such regardless of the values of those who observe them, for example. This thought comes particularly close to the disciplinary field of Economics. Authors aligned with that school of thought advocate an idea of knowledge that is often defined, by them, as scientific, objective, empirical, measurable, neutral, and prone to reconstruction. Furthermore, such knowledge, especially when articulated in the format of an evaluative judgment, should be based on experimental and quantitatively measurable evidence.

Joining this school of thought also means considering the object of evaluation as an *independent variable that produces effects on a given reality or experimental group*, which can and should be empirically investigated, in the most neutral way possible, with the help of control groups (which did not receive the same *independent variable*). This comparative investigation is carried out by decomposing the effects produced into an articulable and possible set of *dependent variables*. One of the values defended by this epistemology is the belief in the neutrality of science, and therefore in that of evaluation. Thus, the evaluator – preferentially external – is the one to secure such neutrality, based on mathematical techniques of randomization, differential and integral calculus, etc. Its reference methods are the experimental, quasi-experimental and its many variants.

The second school of thought, the managerial one, is based on a functionalist understanding of science, for which knowledge is also seen as objective, while admitting some degree of subjectivity, and preferably empirical. From the viewpoint of positionality, this is the closest school to the policy studies field, but also to public administration, especially in its more traditional versions, which are also positivist and anchored to the principles of rational policy analysis and new public management, respectively. In particular, this school of thought – that can be sometimes superficially interpreted as pragmatism-based – is rooted on the notions of efficacy, effectiveness, and efficiency brought to public management; it is characterized by a strong belief in an instrumental rationality for management systems; and it is also rooted on the idea that managers – and those involved (directly or indirectly) in management processes and its objects – have limited rationality. This is mainly due to the game of interests and preferences that would interfere in such rationalities.

Joining this school of thought also means assuming that evaluations should produce useful knowledge oriented to government action, preferably aiming at instrumentally contributing to a government project, even when not explicitly stated. While it is possible to think of internal evaluators, here there is also a market preference for external ones. In different national realities (countries), evaluators end up splitting themselves into markets, oriented by the type of evaluative demand according to the lifecycle of the objects evaluated. In this school of thought, probably the most expressive of all, the evaluators also see themselves as neutral, philosophically less concerned with the separation between fact and value, but more concerned with the separation between politics and policy. Its main reference methods are internal effectiveness evaluation and cost-benefit evaluation.

The participatory school of thought leads us back to a constructivist scientific tradition and

defends a perspective according to which knowledge is practical, situated, and subjective. The disciplinary field of Sociology is often considered to be the closest one to this school of thought, even though we can also find connections with urban and regional planning. The closest type of rationality is communicative, often inspired by the German philosopher Jürgen Habermas, assuming that to be socially useful, evaluative knowledge should be collectively constructed and agreed upon. For this reason, when effectively participatory, the evaluations aligned with this school admit both internal and external evaluators, since the most important thing is the activation of a public directly related to the evaluated object, methodologically assuming the function of "a community of evaluators."

Joining this school of thought also means assuming that evaluation carries with it a democratizing function, often related to the concept of deliberative or participatory democracy. It is also important to note that this kind of evaluations embrace a strong pedagogical dimension. In addition, problematizing learning in its very public processes requires a careful look at the relations of symbolic power contained in evaluations. These relations can be interpreted or redirected towards objectives of individual and collective empowerment of subjects who integrate the community of evaluators and also among them, possibly including learning as one of the categories to be observed. Its main reference methods are Practical Participatory Evaluation (P-PE) and participants-centered evaluation. Before moving on to the next school, we have a duty to point out that not every evaluation that counts on participation can be considered as part of the participatory epistemology.

The fourth school of thought, the anthropological one, although small and much less widely spread than the others, is characterized by a strong linkage to the ethnographic method. It has a greater proximity to the culturalist tradition in science, particularly due to its infatuation with the field of Anthropology. With no shame, it assumes that the notion of knowledge is linked to a normative and subjective matrix of socially constructed, historically structured, and non-reproducible meanings. The type of rationality assumed is often subjectivist and the evaluations are aimed at understanding the network of meanings that permeate and structure the object under study, modeled and shared by groups and/or territories. The evaluator's positionality is not defined in dichotomous terms (internal vs. external) and evaluators may even describe themselves as participating observers.

Joining this school also means assuming a certain proximity to the case study method, often confined to a micro scale of investigation. It also means recognizing that meanings – especially the shared ones – are one of the most important research materials. And, due to methodological coherence, the evaluators affiliated to this school also end up questioning their own structures of meanings. Its products are almost always dense and very in-depth descriptions of the evaluated objects. Precisely for this reason, experiences of this type are often rejected by public policy managers, for example, who fail to perceive the practical utility of its results, wasting the richness of meanings contained therein. Its reference methods are black box evaluation and anthropological evaluation.

Last but not least, the axiological school of thought starts out from the idea that multiple rationalities coexist in public decision-making processes. Anchored in a constructivist tradition of science, with a more interpretative bias, however, this school is the closest one to the field of Policy Studies. Due to this recognition, however, this school positions itself outside the so-called rational analysis and closer to the so-called critical policy studies, consider by some as post-positivist. For the axiological school, knowledge has a normative, subjective, and socially constructed nature and, most importantly, implicitly anchored in active value structures. The idea of value, seen as "defining" the facts, ends up singling out the evaluations that are aligned with this school of thought, as they assume values as its primary research materials. If values form the matter, matter should be dealt with in interpretative ways.

Joining this school of thought can also mean understanding that values can only be extracted

from arguments, since they underlie them (Fischer and Forester 1993). Evaluations should then be concerned with building argumentative matrices around their objects – hence, it is not uncommon that such evaluators are called argumentativists. Furthermore, the evaluator's positionality does not constitute an important research question, as the discussion of positionality is transferred from the evaluator to the evaluation itself. In this sense, the evaluations process is seen as part of a broader policy context, strongly value-based, as it understands that the produced argument is only fulfilled when confronted in public arenas, including in terms of learning. This school of thought admits a multiplicity of methods and instruments, as long as they are normatively defined. Its reference method is the *practical deliberation model* and its derivations – methods that reinforce the political, argumentative, and/or instrumental dimensions of the axiological approaches.

Understanding the Policy Evaluation field through schools of thought can also reinforce three important and almost cadenced movements (of evaluation and of evaluators). The first one is concerned with understanding the field and the disputes that frame it, mainly because these disputes can give density to the filed, can strengthen its schools and can foster the dialogue between them. The second movement refers to the evaluators' search for positionality, in order to become more epistemologically coherent and more deontologically tuned with values and to their networks of meanings, shifting from an applied activity to an implicated or engaged activity, aimed at transforming reality (Boullosa 2020). And, finally, the third movement is that of cohesion and methodological conformity of evaluations and its processes, thus avoiding the mere reproduction of formulas and magical recipes that end up producing a kind of evaluative knowledge of limited relevance, what contributes, in turn, to the immense difficulty of evaluation feedback within the policy process, to the point that a Colombian author, Karen M. Mokate (2009), wrote an article on how to convert the "monster" of evaluation into an "ally."

Finally, it is expected that these cadenced movements will, in turn, be able to promote reflexivity – a positive characteristic yet to be developed in the field – and defined by Donald Schön (1983) as the ability to perceive, reflect, and learn in the course of practices, in a situated way, even when a professional practice is at stake. The low reflexivity of the evaluation field, however, is most certainly due to its excessively applied nature, a reality in which the professional activity is always urgent, disputed, poorly regulated from the outside and with insufficient networks for the production and reproduction of knowledge, as are the cases of professional and training networks. But, in part, it is also due to a weak articulation between the more systematic production of normative, classificatory and/or historical knowledge and a certain abundance of evaluative products that are built based on their own evaluation objects. Now referring to Argyris and Schon (1978), in order to increase the field's reflexivity, it is necessary to invest in the expansion of its learning processes.

## Brief Words on Meta-Evaluation and Monitoring

Before moving to the end, a few words on meta-evaluation and monitoring are necessary. The first is actually quite old and only now begins to gain its deserved prominence. There is a consensus that the term meta-evaluation was coined by Michael Scriven in 1969, even though Orata had already spoken about "evaluating evaluation" in 1940 (Cook and Gruder 1978). In general, by meta-evaluation, we understand the evaluations that have as its object another evaluation. In addition, in almost all efforts to define what it would be, the formative problem appears as central. In fact, in the 1970s and 1980s, it was often said that meta-evaluations would be a formative evaluations of a summative evaluations, based on Scriven's classification. Gradually, this idea has narrowed to the point that some definitions even advocated that a meta-evaluation would be practically a new evaluation on the same object, research questions and data, functioning almost as an instrument for checking results. Fortunately, this vision has barely prospered, and new efforts began to be

directed both to the improvement of the technical qualities of the evaluations, as well as to the training of evaluators, when to serve as a possible instrument of social control.

Evaluation and monitoring are two very close activities, but with some characteristics that make them unique. Unfortunately, it is common to find authors who use the terms evaluation and monitoring as synonyms, especially when it comes to empirical works (Rodrigues 2014; Wollman 2007). This false synonymy is especially harmful to the concept of monitoring, since, almost always, such authors are in fact referring to evaluation, not monitoring, relegating the latter to an appendix or tool of the former. In common, evaluation and monitoring have the nature of applied research, the purpose of presenting answers about the progress of objects (such as programs, projects, actions, etc.) departing from specific questions, which may or may not include the need for a final judgment or synthesis. The difference between them concerns the relations they establish with causality, since monitoring always depends on a hypothesis of functioning of the observed object. In other words, monitoring deals with patterns of data behavior and can be associated with alerts in case of variations beyond what was previously considered acceptable. It is a permanent and continuous action of observing one or more objects that occur in the form of phenomena, objects affected by a phenomenon, a happening or an event that arouse interest for some purpose or utility within a space of human insertion. In other words, monitoring must be seen as a process of continuous monitoring of the internal and external conditions of an object in its context as it occurs in time and space, covering all its characteristics of interest.

The proximities and the differences, however, ended up opening a new path of intersection between such activities: complementation (Boullosa 2009). Although it is very rare to find evaluation and monitoring efforts on the same object, the advantages of bringing them together can be great. Firstly because of the opportunity to build very specific questions about the same object. Secondly, because a concrete and complex evaluative knowledge about the actual state of an object would give us the possibility to build a more accurate system of the points or components of the same object that can be monitored – especially with regard to the ability of such components to translate or to represent the general progress of the object's state at a specific time. And, finally, because a good evaluation provides us with a kind of "ground zero" for monitoring, helping to expand its own control purposes.

## Can We Talk About a New Work Agenda?

In order to talk about a possible work agenda, we need to carefully observe the current movements in the policy evaluation field. And it looks like they are of two kinds. The first movement is more institutionalized and has to do with the confluence of many efforts coming from new associations that can be found in different countries of the world – such as agencies and networks – but also coming from second-level networks, derived from the national ones. From this movement, which was fundamental for the creation of Eval4Action (the global campaign for evaluation activated by the United Nations), for instance, we have been witnessing complementary efforts to professionalize national and regional networks, to create permanent channels of knowledge dissemination, such as specialized magazines, as well as efforts focusing on the systematic inclusion of evaluation in official government agendas, companies, and civil society organizations; the qualified promotion of evaluation by international cooperation and local development agencies; and a more systematic supply for qualified training in evaluation.

The second movement is more subtle, less articulated, but perhaps even more powerful. It finds its roots in the **formative** idea of Scriven (1967), in the **comprehensive** model of Rossi and Wright (1984), in the **constructivist** paradigm of Guba and Lincoln (1989), in the **program theory** of Carol Weiss (1972), in the **argument** of Fischer (1995), and in Boullosa's **frame of values** (Boullosa 2020). And it goes further, seeking to understand evaluation in its political dimension of social change and through a more plural and

strongly democratic notion of evaluative knowledge, anchored in new epistemologies – in a kind of movement that has also been transforming language studies in Europe, subaltern studies in Asia, decolonial studies in Latin America and Africa, and feminist studies distributed in the Americas as a whole. These new incursions clearly represent a search for a normative and axiological positionality. At the one hand, they enhance the evaluation processes, bringing conceptual pairs with innovative normative depth to the surface – such as power and ethics (Foucault), intersectionality and oppression (Crenshaw), body and politics (Safatle 2015), emotion and citizenship (Marcus 2008), learning and transgression (Hooks 1994), experience and public policy (Peres 2020), learning and multiactoriality (Boullosa 2019); and, on the other hand, they point to a different future for policy evaluation, one engaged with the democratization of societies through the democratization of knowledge.

# Policy Failure

Mauricio Olavarría-Gambi
Universidad de Santiago de Chile, Santiago, Chile

## Synonyms

Ineffectiveness of public policy; Policy failure

## Definition

The inability of a public policy to achieve its goals, to get results that benefit – or at least do not harm – the population to which it should serve, to materialize the values and purposes promoted by its proponents, to give legitimity to the government, and to generate greater efficiency and/or effectiveness compared to other public policies that could have been implemented to cope with the same problem.

## Section

Latin America and the Caribbean

## Introduction

The expression of the failure of public policies is conceptually complex, because it has been used in an unsystematic and elastic manner to refer to different kinds of situations, results, consequences, and with some frequency, as an argument in political confrontation with the purpose of achieving support for a given cause or delegitimizing the initiatives of opponents (Zittoun 2015).

Furthermore, a public policy may have failed in some aspect or area in which it participates, but not necessarily in others or in all the areas in which it operates. That happens because public problems are multidimensional and because a public policy is rarely so focused that it deals with only one facet of the problem. For example, the Transantiago, the public passenger transport system implemented in the city of Santiago, Chile, in 2007, which was characterized by The Economist (2008) as "a model of how not to reform public transport," has achieved some positive results, such as the implementation of a prepayment card that incorporates a technological device which in contact with a collecting machine installed in each bus charges the cost of the ticket. This has led to a substantial decrease of assaults to buses in the city's peripheral zones and to the drivers concentrating on driving the bus, which in turn has meant a large decrease in the rate of accidents involving public transport buses.

On the other hand, besides defining the idea of public policy failure, a highly significant issue is to be able to generate an analytical framework that allows an integral understanding of the situations that get to be characterized as public policy faults or failures. Therefore, this kind of analysis must answer three intrinsically related questions: (i) When can a public policy be considered to have failed? (ii) What situations or circumstances determined or were key aspects in generating the

failure? and (iii) What type of lessons can be gotten from a case of a failed public policy?

## Conceptual Issues

### On the Identification of a Failed Policy

The academic literature usually treats the notion of fault as the reverse of success of a public policy (see, for example, McConnell 2010a, b; Baldwin 2000; Boyne 2003; Marsh and McConnel 2010; Newman and Head 2015). So a successful policy is considered to be one that achieves the established objectives, gets favorable results, and respects the values and orientations of the governments that implemented them. On the other hand, a public policy is seen as a failure when it does not achieve the objectives that were set, when it affects negatively the population that it was meant to benefit, when it is ineffective, inefficient, or its costs are excessive compared to another intervention that could have been implemented to deal with the problem, and/or when it generates negative political consequences – reputational and/or electoral – in its promoters and implementers. McConnel (2010a: 357) states that "Program failures, in essence, not only fail to accomplish what they were intended to do but can also threaten the position of politicians and parties that sponsor failed programs."

Considering the multidimensionality of problems approached by the public policies, the characterization of failure must therefore be made in reference to those aspects, realms, or areas in which the already mentioned negative effects are produced. Therefore, summarizing, a public policy may be considered as a failure when in the analyzed aspect, realm, or area it is incapable of achieving its objectives, obtaining favorable results, being effective in its implementation, providing legitimacy to its proponents, and/or, furthermore, harming the welfare of the objective population to which it should benefit.

### On What Leads to the Failure of Public Policy

Although this characterization and brief definition allows identifying when a public policy can be considered as a failure – or the concrete realm to which the analysis refers – the next step in an integral analytic perspective is to identify the situations and/or circumstances that would have led to unleash the fault. Consequently, the issue that must be dealt with at this stage is, following Peters (2015), whether the fault is more related to the design of the public policy, to its implementation, or to the governance system in which the policy process is embedded.

The failures associated with the policy design refer to the fact that there has been a deficient conceptualization and understanding of the public problem that must be approached, the setting of goals, the selection of instruments, the specification of activities, tasks, and/or the assignment of executors. This type of deficiencies may lead to not achieving the assigned objectives, generating unfavorable results, loss of welfare of the beneficiaries of the public policy, and/or producing negative political consequences to their promoters.

The failure associated with implementation, on the other hand, would be located in the complex network of interactions that link persons and organizations with the objective of executing a set of activities that have been established with the purpose of achieving the objective assigned to the public policy. According to Dimitrakopoulos and Richardson (2001: 336), implementation refers to "the complex process of putting a policy into practice by a variety of mechanisms and procedures involving a wide and diverse range of actors." On this point, it should be recalled that "a public policy can be seen as a hypothesis on how a given goal, assigned to a State intervention, can be achieved if a given group of activities, deduced from a set of knowledge that is considered valid, is put in operation" (Olavarría 2016: 3).

Furthermore, it also must be recognized that the limit between failures associated with the design and those associated with the implementation is dim, and recurrently, impossible to clarify. This happens because it is not possible to analyze the implementation of a public policy without referring to its design. Focusing on the analysis of the implementation, Pressman and Wildavsky (1984: xxv) argue that "the separation of public policy design from its implementation is fatal (and

that) . . . though we can isolate policy and implementation for separate discussion, the purpose of our analysis is to bring them into closer correspondence with one another."

Thus, implementation is seen associated with the governance system in which the public policy is inserted and in which are established the cooperation and coordination mechanisms of the set of actors – organizational and individual – that take part in the public policy process. The perspective of the governance stimulates the development of an integral vision of the system that harbors the policy, because it makes it possible to see how the design, the organizational performance, and the interorganizational arrangements interact and converge to produce the results observed in the implementation of the public policy.

Therefore, the fault in the implementation would be the consequence of a governance fault, which involves the ability to monitor what is happening in the system, direct the organizations that take part in the implementation toward the established goals, intervene when deviations are detected, and close the gap that exists between the ideal of the public policy and the reality of the actions of individual autonomous organizations (Van der Steen et al. 2015), which the action performed by organizations involved in the implementation generate stimuli and feedback that are taken into account as supplies by other organizations, creating a pattern that magnifies the original effect.

The fault associated with the implementation would therefore be the consequence of an inability of the system in charge of putting in practice the policy, to direct and articulate the actions of the executing agencies needed to achieve the established goals.

### On the Lessons from a Failed Policy

The third step is to identify the lessons that may be obtained from a policy failure. Four types of lessons can be gotten from that analysis.

The learning on the problem that will be approached by a public policy implies deepening the knowledge on the situation which is considered problematic, the causal links that would be producing it, and the interrelation and effects that it would have with and on other situations, as well as specifying the scopes and goals that the public policy would have on the problem which will be intervened.

The technical learning refers to the relation between the instruments applied and the established goals, to the availability of the information and data needed for designing the policy and monitoring the implementation, and to the effectiveness of the policy management model.

The institutional learning is related to the lessons left by the failed policy in terms of practical operation and application of the set of rules and norms that govern the design and implementation of the policy, the organizational designs and performances, the established interorganizational arrangements, the size of the human work teams, as well as the abilities and competencies required to carry out the intervention established by the public policy.

The political learning refers to the knowledge left by experience on how to maneuver in the power networks to get political support for the public policy initiative, how to neutralize the criticisms and oppositions, how to prevent proponents, promoters, and supporters to abandon the initiative, how to communicate more effectively the scope, goals, and operation of the policy to larger audiences, how the population to which it is addressed would benefit, and also how to be prepared to react promptly when a crisis occurs.

Therefore, the study of the lessons left by a case of public policy failure is a multifaceted analysis that involves aspects relative to the social construction of the problem itself approached by the public policy, technical aspects, political consequences, and on the distribution of power, institutional and organizational aspects that have had an incidence on the results, and effects generated by the public policy.

## Concluding Remarks

The development of an integral analytic perspective of a policy failure leads to the need of approaching three interrelated issues: when can a policy be considered to have failed, what

situations or circumstances led to the fault to take place, and what lessons can be obtained from the experience.

The identification of the failure of a public policy is related to its inability to achieve the objectives that were established, with adverse results and impacts, with negative political effects for its promoters, and harm to the welfare of the population it was meant to benefit. The situations and circumstances that lead to the failure of the intervention can be located in the design or in the governance system that hosts the policy and from which it is managed. The learning will make reference to the problem itself that is approached by the policy, to the technical, institutional, and organizational aspects involved, and to the management system of the public policy.

This entry has benefited from the work done by the author in the article "Policy Failure Revisited: Conceptual Implications From the Chilean Case of Transantiago", *Administration & Society*, 2018, https://doi.org/10.1177/0095399718786878

# Policy Innovation Labs

Adam M. Wellstead
Department of Social Sciences, Michigan Technological University, Houghton, MI, USA

## Synonyms

Policy sector innovation

## Definition

Policy innovation labs (PILs) are a global response to the growing demand for public sector innovation and the development of policies addressing complex issues. PILs can be found within and outside of governments. They encourage the use of tools that facilitate experimental lab-like environments.

## Introduction

Policy innovation labs (PILs) are a relatively new methodological approach by which governments

are attempting to construct public policies that address complex collective problems. They are defined as approaches that adopt creative, design, or user-oriented perspectives. PILs are considered to be neutral organizations applying scientific, lab-like methods to generate innovative, evidence-based policy solutions to complex social problems, therefore considered to "represent islands of experimentation where the public sector can test and scale out public service innovations" (Tõnurist et al. 2017, 1432). Many PILs work for or within a government entity and contribute to the shaping or implementation of public policies (Fuller and Lochard 2016). There is no consensus respecting how to define "policy innovation." In response, PILs have unique, and often elastic, definitions of what they themselves take this concept to mean, but for many, placing the end user at the center of the policymaking process is central (Fuller and Lochard 2016). PILs define themselves as "producers" and "facilitators" of policy innovation and act as physical spaces or "hubs" serving to promote collaboration across organizations and discrete functions to test ideas and prototypes (Coblence and Vivant 2017). PILs, some contend, are contributing to a rapid turn to experimental approaches within government and in policy work (McGann et al. 2018). In global terms, the bulk of these have been established since 2011. The worldwide number is not known. However, a 2020 study found that there were over 120 PILs based in the United States (Wellstead and Nguyen 2020). Examples of PILs include GovLab (New York), Nesta (London), The Policy Lab at the University of Melbourne, and Pulse Lab Jakarta.

## Defining PILs

PILs have many competing labels and terms; in addition to PILs, they are referred to as social labs, government innovation labs, creative labs, open creative labs, and policy hubs. PILs often work within or for a government entity at the local, regional, and national levels, such as hybrids of think tanks, digital RD, labs, centers for innovation, design labs, social enterprises, and charitable organizations. PILs act as champions and enablers of innovation by providing the space to experiment with innovative methods in designing policy, with the implication that these practices are otherwise limited or fail to develop because of the risk aversion endemic to the public sector generally and to government in particular. PILs are often considered to provide methodological expertise and skills beyond what many regular civil servants usually possess. By doing so, they serve as a mechanism to reconcile the structural tension between the growing need for policy innovation on one hand, which inherently involves risk taking while mitigating the blame avoidance tendencies within the government.

PILs are increasingly being established and commissioned by governments to bring new insights and approaches to policy design and the delivery of public services. Policy "labs" differentiate themselves from traditional public service approaches through their roles as "dedicated teams, structures, or entities focused on designing public policy" (Fuller and Lochard 2016). Many PILs tend to be autonomous and structurally separated from the public sector while still operating within it, acting as "change agents." They often act as physical centers or "hubs" that promote and facilitate collaboration across sectors, testing and scaling of ideas and prototypes, and centers for collecting and mobilizing knowledge and evidence. In cases where they exist within public institutions or governments, there is often the goal of acting as "ambassadors" for legitimating and promoting policy innovation practices within their own structures (Coblence and Vivant 2017). PILs, as experimental spaces for designing policy solutions developed through various change methodologies, create momentum in the solution of an array of collective problems (Allio 2014). This is achieved by engaging stakeholders in processes like workshopping and prototyping (Bellefontaine 2012), using collaborative technologies such as web 2.0, as well as highly visual approaches like storyboarding. Adopting methodological techniques, such as ethnography or action research, to work directly with people who are affected by the policy or program is one hallmark of the process. The goal of PILs is to

create a collaborative space to enable participants with varied skill sets to reach a common understanding of a policy challenge and then explore, design, and test user-centered solutions for potential implementation across the system (Bellefontaine 2012).

Adding to the complexities surrounding PILs is their eclectic nature. Typically, PILs proceed on a project-by-project basis, but each lab has a different project selection process. Projects can be commissioned by partners outside of the lab, pursued independently by lab staff, or brought forward by network members. For example, many government PILs are interdepartmental by design and openly solicit project ideas from any department or state agency that wishes to undertake an innovation project. Some PILs focus on specific policy areas such as health, transportation, or social care policy, while others are purposely open to all policy areas. In terms of location, PILs can be situated inside, outside, or on the periphery of government. Commonly, non-governmental PILs operate out of universities but are increasingly also independent nonprofit entities dedicated to "social innovation." PILs funding models are similarly varied. In terms of financing, labs can be funded directly and exclusively by governments, while some are registered charities and receive their funding through donations and grants from foundations, while others operate on the model of for-profit business and are financed by their commissioned projects. Though some labs have established themselves and matured over the past decade, the majority of policy labs are on average only 2 years old and are themselves experimental structures. Though new labs are created each year, a number are also dismantled as a result of budget cuts or changes to political agendas or leaders (Fuller and Lochard 2016). PIL are created in the public sector to cope with external complexity (e.g., the rise in user-led expectations; austerity).

Although often loosely defined and despite no official role attributed to PILs, most agree that they contribute both to shaping as well as to implementing public policies (Fuller and Lochard 2016), which entail a twofold function. First, PILs act as "producers" and "facilitators" of policy innovation enabling experimental policymaking spaces for designing policy solutions developed through various change methodologies which aim to create momentum in the solution of an array of social, economic, or environmental problems. Specifically, PILs allow participants with varied skill sets exchange information, knowledge, and ideas to reach a common understanding of a policy challenge drawing on a process which benefits from diversified inputs to allow innovative ideas (Thoring et al. 2018). Second, PILs generate policy innovations by exploring, designing, and testing optional implementation alternatives, thus serving as physical spaces or "hubs" to promote collaboration across organizations and discrete functions (Coblence and Vivant 2017) in order to test ideas and potential prototypes of user-centered solutions across the system, which echo PILs as promoting evidence-based, and particularly user-focused policymaking.

The literature distinguishes four types of PILs: (1) design-led labs, which are concerned with the application of "design" thinking to policy and are focused on "user-centered" methods such as ethnography, visualization techniques, and collaboration with citizens and other stakeholders to clarify problem definitions and co-create solutions; (2) open government/data labs that employ innovative approaches in data analytics such as applying new digital and web-based tools to open up and interrogate public data, therefore drawing from expertise from diverse participants to run and apply data analytics; (3) evidence-based labs that are focused on the application of rigorous evaluation techniques, principally randomized controlled trials (RCTs) and an adherence to the idea of evidence-based policy; and (4) mixed labs, which employ any one of these three approaches.

Thus, innovation labs are understood as both a process and a particular kind of work space that breaks down hierarchy and engages people in divergent and creative thinking. Innovative methods applied to policy collaboration include hackathons where large numbers of stakeholders meet over several days to parse out the details of a policy or program problem and crowdsourcing ideas through online collaborative mapping of a policy problem. Other labs undertake strategic

foresight, design thinking, and behavioral insight methods (Brookfield Institution 2018).

## Origins of PILs

The emergence of PILs has been explained by a number of trends in the public management field. Broadly they are part of a long-term ongoing agencification process in the public sector, namely, creating new agencies and giving them more autonomy. There has been a growing interest in evidence-based and particularly user-focused policymaking and the popularity of "open government" agendas. Open government in particular is concerned with citizen empowerment and employs information-communications technology to improve governance, both practices that are generally promoted by policy labs. However, it has been argued that technology-driven innovation requires more fundamental organizational changes and is not alone a driver of innovation. Secondly, at the organizational level, the establishment of PILs has been mandated in order to remove bureaucratic barriers that otherwise hinder policy innovation. They facilitate internal learning (e.g., search for productivity gains) and legitimize change through specialization and the concentration of experts.

## Policy Co-production

This focus on collaborative co-construction of public policy leads one to question how or if PILs fit into the rubric of new public governance (NPG) theory. The core characteristics of new governance are collaboration and deliberation Gunningham (2009). In concrete terms, collaboration refers to bringing "multiple stakeholders together in common forums with public agencies to engage in consensus-oriented decision-making" (Ansell and Gash 2008, 543). Policy solutions to complex problems can be negotiated through collaboration. The closely allied concept of deliberation is concerned with enabling all stakeholders, not just government decision-makers or elite stakeholders, a role in the policy process (Van der Heijden 2013). Policy co-construction, the deliberative process at the center of new governance theory, assumes a fairly even distribution of political and other resources among nongovernmental policy actors which fails to acknowledge that in this framework, "talk is disconnected from power" (Noveck 2011, 89). Policy is an expression of power relations in society and as power is unevenly distributed.

Facilitating empowerment through stakeholders' meaningful involvement by contributing to breaking down traditional bureaucratic hierarchies and to the redistribution of power. One of the hallmarks PIL is working directly with people who are affected by the policy or program and in general drawing on methodological techniques such as workshopping, prototyping, ethnography, and other types of action research. By creating lab-like organizations, they aim to create a leading role in the rapid turn to experimental approaches within government in general and in the design of policy interventions in particular.

PILs, as experimental policymaking spaces for designing policy solutions, are designed to create momentum in addressing solutions to an array of social, economic, or environmental problems Allio (2014). This is achieved by engaging stakeholders in processes like workshopping and prototyping (Bellefontaine 2012), using collaborative technologies such as web 2.0, as well as highly visual approaches like "storyboarding." Adopting methodological techniques, such as ethnography or action research, to work directly with people who are affected by the policy or program, is one hallmark of the process. Evidence-based analysis and sophisticated research techniques needed help improve the efficiency and effectiveness of public programs should also play a critical role in PILs. For example, the MIT Lab for Innovation Science and Policy states that it "aims to become the place that policymakers, senior executives and entrepreneurial leaders turn for evidence-based guidance on the design of innovation-focused job policies and programs." To achieve such activities, a key feature of PILs is to create a collaborative space to enable participants with varied skill sets to reach a common understanding of a policy challenge and then explore, design, and test

user-centered solutions for potential implementation (Bellefontaine 2012).

## PIL Functions

PILs are expected to fulfill a number of critical functions. First, proponents advocate that PILs' employ methods that will increase the odds of addressing complex social problems systematically at their roots, and some would even argue that PILs "have the methodological expertise to understand social problems, get inside the public perspective, and generate insights and ideas for future policy interventions and practices of governance" (Williamson 2015, 4). Second, PILs are expected not only "to create motivation and commitment to design thinking for policymaking, but also to facilitate the 'social turn' (Chen and Huang 2007) within the field of policy analysis, that is, revolutionize policy design to a framework that facilitates participatory and cross-disciplinary approaches to social problems (McGann et al. 2018)." Third, a more reluctant expectation emphasizes that the prominence of PILs will lead to prioritization of more technical, scientific aspects, such as methodological skills and technical expertise both in policy analysis in general and in the policy design in particular, while causing a neglect of significant sociopolitical aspects of policymaking, including, for example, values and ideology, political feasibility, as well as moral and ethical considerations.

## Conclusion

The popularity of policy innovation labs (PILs) since 2010 is reflected in their rapid global growth. Their growth has led to claims that PILs "are on the path to becoming a pervasive part of the social infrastructure of modern public organisations" (Carstensen and Bason 2012, 5). There are a wide range of PILs each defined by the nature of the issue they seek to address, the composition of stakeholders, their autonomy and funding from government agencies, and the tools each employs. They are a response to the perceived inability of traditional hierarchical risk-adverse structures within civil services to address new and complex issues, particularly technological innovations (e.g., artificial intelligence, big data). Following the analogy of a scientific lab, many share the common feature of promoting experimental spaces and encourage greater participation by those affected by new policy designs. By doing so, novel approaches to engagement are employed such as design thinking, hackathons, ethnographic research, service blueprinting, data science, and digital tools. While there is a growing literature on PILs internal structures and reasons for their formation, their impact on policy development and societal impact are an emerging field of research.

# Policy Making and Crisis Management

Abdulrasheed A. Muhammad
Department of Political Science, University of Ilorin, Nigeria, Ilorin, Nigeria

## Synonyms

Administration; Disaster; Emergency; Organisation; Programme; Rule; Strategy; Supervision

## Definition

A policy is a deliberate decision taken on an identified problem or refusal to take any action.

A crisis represents an unfavorable situation that produces adverse effect(s). Crises management is, therefore, the process of systematically managing such situation.

## Introduction

Policy making is an aspect of general administration which is relevant to both public and private domains. This is because human societies are characterized by series of challenges requiring attention. Such challenges may be in the form of political, economic, health, or other form of crises. It could also occur to both governments or public bodies and private individuals or organizations. The natural tendency when crisis occur is to seek a way of ameliorating or solving it. Thus, having a policy on such issue becomes important. Policy making is common to both government and private entities. A commonality between them is the idea of interest. Policies are made to achieve maximum interest of the entity concerned. However, while government/public interest may not necessarily be in economic terms, business organizations usually think in terms of economic benefits and this is why it is at times crises management is conceived as risk management by business entities. All the same, both public and private organizations are involved in formulating policy to address a named problem. This entry examines issues surrounding how public policy is used to manage crises using a case study of the coronavirus pandemic.

## Issues in Policy Making

All policies must have a rationale, process of arriving at it and actors involved as well as several forms of it. All these are focused in this section of the entry. Policies are made to address a named problem. It represents a strategy for managing identified crisis which if left to fetter can result into greater crisis or crises. For this reason, it is an integral part of management in any organizational set up or state entity. It provides a guide for the day-to-day administration of any organizational entity be it a state, private organization or an individual. This means that policy making is applicable to both public and private realms. However, while policy at the private or individual realm can be described as micro since it has limited sphere of application, public policy can be situated within the macrorealm because of its larger sphere of applicability. Also, at the public realm, policies often stem from and are in compliance with enabling laws. It may at times

involve drafting of bills for legislative approval or issuance of executive order. This implies that both the legislative and executive arms of government (President/Prime minister, other ministers or aides, civil servants, and other agencies of the executive arm) are actors in public policy formulation process. For business entities, the actor in policy making is the company's management. Also, policy at times produces intended impacts in which case it achieves the objective(s) of making it and at times, it results in unintended impact. For example, recent efforts by governments all over the world to reduce the spread of the coronavirus disease (COVID 19) through stay at home order produced both intended and unintended impacts. While the policy was able to curb peoples' movement especially between countries, the avalanche of other vices such as domestic violence resulting from the stay at home order was not intended.

It is important to note that while policy and procedure are similar and goes hand in hand, they are quite different in their focus. Policies, for example, are targeted at addressing some challenges through systematic analysis but procedures emphasize sequence of steps that must be taken to address the challenges. Together, however, they help to establish standard of behavior or performance in a state or an organization on a particular issue as well as help to achieve accountability on the part of management because achievement of goal will be the measure of performance of management. It is equally important to distinguish between policy making and decision making. While the latter implies selecting a particular course among several alternatives, the former has to do with coming up with a particular plan of action to address a named problem. In other words, decision making is part of the policy making process. For example, it may be a policy of the government to ensure that citizens have access to quality living. Governments' decision in this regard will include provision of hospitals, drugs, and descent housing among others for the benefit of the citizens. A business entity or a private organization may have a policy of filling vacancies from its internal staff. Its decision to actualize the policy may, therefore, involve given a right of first bite to its internal staff or taking a step that will confer advantages on its staff.

In terms of policy cycle, that is, the stages involved in the making of a policy, quite a number of stages exist with some variations. However, the divergencies in the stages are rather in terms of number than in the substance of the activities. These stages, for clarity, can be summarized into (i) identifying a named problem that requires urgent attention. This may be global or country specific (ii) identification of alternative courses of action on the problem. This requires prioritizing the alternatives (iii) taking a decision. That is, choosing the best or most feasible alternative (iv) implementing the decision. This can be done through civil servants/bureaucrats or through special commissions or agencies in the case of public policy. It may even be implemented via executive orders. Business entities may utilize the advantage of special committees or through a supervisor. (V) Evaluation or Feedback. This is a critical stage in policy cycle. At this stage, the outcome of the policy is assessed to determine its efficacy or otherwise in order to determine its continuity, modification, or change. Where there is need for modification or change, the outcome forms another input and the policy cycle is repeated. Even where there is need for continuity in the policy, more conscious efforts are made toward its implementation.

Another issue worth considering is the typology of policy. Broadly classified, policy could be **regulatory** or a **welfare** policy. Regulatory policies tend to curtail its targets from embarking on what it wishes or compelled to take alternative action, for example, regulation banning smoking in public spaces, drinking, or prostitution. In relation to the public, it is about achieving an objective through regulation of an activity in order to deliver better economic and social outcomes and thus enhance the life of citizens (http://www.oecd.org/gov/regulatory-policy/). This type of policy limits discretion and influences behavior of its targets. In other words, it sets standard of behavior or processes of doing things. The rationale for this type of policy include to achieve efficiency and equity and, to secure public good or interest. It, therefore, follows that public confidence in the

regulator is necessary for this type of policy to succeed. Similarly, private organizations, especially business entities, often seek to achieve maximum benefits with little cost as a result of policy taken. Welfare policy on the other hand implies an attempt to deliberately enhance the living standard of the people. It could be in the form of social insurance policy or a form of progressive tax regime. Welfare policy could be in the form of distributive or redistributive policy. Distributive policy involves distributing benefits to citizens of a country such as providing public education and infrastructural development. Redistributive policy on the other hand is discriminatory in nature. It is when policies are intended to create relative equality among citizens. In this case, it limits the gap between the haves and the have-nots in the society. Examples of this include progressive tax, subsidies on some products as well as value added tax on luxury products. Welfare policy, therefore, seeks to provide benefits to the people. For business organizations, welfare policies seek to enhance performance of the worker which in turn will increase productivity. An organization may decide to provide transport incentives for some categories of workers or it may take up a health policy for its workers. This not only has the advantage of solving known problems but equally, preventing crisis from arising in the first place.

## Crises Management

Crises management includes the identification of potential crises and how to deal with it (Hayes 2019). Policy making is an instrument of managing a crisis since crises represents an identifiable problem. In this wise, the coronavirus disease (COVID 19) pandemic that is ravaging the entire world can be seen as a major health crisis that needs formulation of a definite policy to manage it. Implicit in this is that crisis may result from actions or activities in a particular country and later assume a global dimension. The utmost goal is to ameliorate or curb effect of the crisis. Most writings on crises management relate it to a business organization (Hayes 2019; Zamoum and Gorpe 2018; Institute for Public Relations 2007). However, it is equally applicable to the management of the state although there are little or no efforts in espousing this view in the literature (see, Rosenthal and Kouzmin 1997). In a business sense, three stages of crisis management exist. These are precrisis, during crises or crisis response and post crises period. Crisis at the states level cannot, however, rigidly fit into this categorization in the sense that some crises are not anticipated. What this implies that policy makers do not often prepare themselves or the public for appropriate responses once tragedy strikes (Rosenthal and Kouzmin 1997). For instance, COVID 19 pandemic is a health crisis that has engulfed countries of the world but it cannot be said to be anticipated. For this reason, the study of crisis management can be seen to involve a multifaceted analysis that includes social, political, economic, historical, and cultural considerations. From whichever angle it looked at, crisis management must involve deliberate action to end the crisis. This finds expression in policy making.

Of importance is the fact that crises are not static. Indeed, the frequency, nature, and consequences of crises are changing and they often affect societies in different ways (Boin 2009). This makes policy making a changing phenomenon in response to differences in time and context in which crisis occur.

## Case Study: COVID 19 Pandemic as a Health Crisis

The essence of this section is to analyze how the coronavirus pandemic constituted a crisis for the world that requires policy making in order to address it. This is with a view to providing empirical justification for the various stages of policy formulation mentioned above. The coronavirus disease (COVID 19) started in Whuan, China, December of 2019. It is a respiratory disease and one of the many viruses belonging to the coronavirus family. However, COVID 19 is believed to be different in the sense that it is a new variety of

the virus whose DNA has not been fully understood by scientists and has no known cure or vaccine yet. In February 2020, the World Health Organization declared it to be a global health pandemic as global search for a cure or vaccine for it continues. Ever since its emergence, it has been ravaging the entire world except Antarctica and infecting millions of people till date (millions in the United States of America {USA} and Hundreds of Thousands in Africa). Since it originated, three theoretical perspectives about it have emerged. These are significant because they touch on the emergence of the virus and also have implications for its eradication. They are the divine/spiritual perspective, the orthodox/Scientific perspective, and the Conspiracy theory.

The Divine/Spiritual perspective is promoted by religionists. They are of the view that emergence of the virus is a direct consequence of man's iniquity against God and as such, it was an affliction sent to the world by God. For this reason, the solution to the pandemic does not lie in anything but repentance by man for his sins against God. Another variant of this perspective says that it has earlier been predicted that the virus will affect the world at this time. Nosradamus, a seer, who is believed to have predicted many events before his death, was said to have even predicted emergence of the novel coronavirus at night in the twin year (2020) and in the city with seven hills (taken to be Italy). However, there is no evidence to suggest that the virus emerged at night or is there any scientific basis to classify Italy as the country with the Seven hills. More so, the virus was known to have emerged in Wuhan, China in 2019 and not 2020. The second perspective is the Scientific or Orthodox view and it is responsible for the much that is believed about coronavirus in the world today. The perspective sees the virus as a novel one belonging to the family of coronaviruses. To them, it was first discovered at a village in Wuhan, China, from where it spread to other parts of the world. While there is no known cure for it, the virus can only be transmitted from human to human through inhalation of droplets released by an infected person through sneezing or coughing by a healthy person. It is only after inhalation that the virus multiplies in its new host. They also maintained that the virus is not a living organism and as such, does not multiply except in it finds itself in a host. The perspective appears plausible because of its empirical base because t has been replicated by several scientists and found to behave in like manner. The third perspective is the conspiracy theory. There are several variants of this perspective. First, those are who believe that the virus was manufactured in laboratory and unleashed on the human race to reduce populations especially in Africa. Similar to this are those who believe it is a biological weapon that is developed in the laboratory by China to attack the United States of America. Some even argued that it was the United States actually developed it and launched it in Wuhan, China. However, China has later overcome it, changed the virus DNA, and relaunched it on the USA. They cited the indifference of the USA to threat of the virus when it was ravaging China to support this claim. However, all were mere speculations as there was no concrete evidence to prove any of the claims. A second variant of this perspective linked its emergence to development of the 5G communication technology. According to this view which is more popular in developing and under developed countries, there is nothing like coronavirus rather, it was a ploy by dominant powers to cover up their launch of the 5G technology. The argued that those who are dying are dying from impact of the 5G technology and not coronavirus. It must be stated, however, that this argument cannot hold water because even where 5G network has not been launched, people are still dying from what is considered coronavirus induced death. It was rather a mere coincidence of time between the 5G technology (whose radiation is believed to be high and capable of causing death to an exposed person) and the virus. Similarly, who would query the rationale for developing a virus in the laboratory as a biological weapon either in China or USA and citizens of the country too will be greatly affected. Irrespective of the perception of people on emergence of the virus, however, it is a great crisis in the sense that its effect on human existence

spans both economic, social, and political dimensions (World Health Organization (WHO) 2020; Jang and Farise 2020). This makes it a known problem.

Having established the dangers posed by emergence of the virus, governments all over the world began to develop measures aimed at combating it. Governments were faced with a difficult alternative of forcing people to stay at home and curtail the spread of the virus and to allow free movement by the people and experience a spike in the number of cases. Most countries eventually took decision to go with the former and that manifest in the lockdown of countries – local and international flights were cancelled, movement of people were curtailed, business beaches, places of worship, etc., were closed among others. The significance of this exercise is that a decision has been taken. However, countries differ in the implementation of the decision.

In terms of implementation, many advanced countries were able to complement this regulatory policy with providing some welfare for their citizens. Food items and items for domestic use were provided in some cases. Unfortunately, this could not be for many developing countries where people tend to reject the lockdown measure by the government. People are faced with a difficult choice of staying at home and die of hunger and, going out to fetch a living with the attendant likelihood of contracting the virus. This is so because most developing countries could not provide the necessary palliatives to cushion the effect of lockdown thus igniting civil disobedience and litigations against the state. For example, courts in Uganda and another in Malawi restrained the government from imposing a lockdown on the people (Anami 2020). In Malawi, people took to the streets to protest lockdown (AFP 2020; Newsbrake 2020; https://www.dw.com/en/do-corona-lockdowns-in-africa-make-sense/a-53228689).

An evaluation of the lockdown decision by different countries led to re-examination of this policy. While some have eased the lockdown, some have modified it, some others have maintained the lockdown while others have re imposed the lockdown. On the whole, this decision is based on the result of each country's evaluation of the initial response.

## Conclusion

This entry examined policy making and crises management. It distinguished between policy making and related concepts as well as rationale for policy making. It equally observed that policies are made in response to challenging crises. Such crises may be in the form of natural disasters, diseases, and epidemics. It may also be international or domestic in nature, static or dynamic. The crisis generated by emergence of the coronavirus disease was examined to provide empirical discussion of the stages of policy making identified. Whatever the nature, a policy is formulated to address it. It is realized that while the state and business entities may have different perception of crisis, of utmost importance in the success of any policy is trust of policy makers by the citizens. That is, in policy making, trust matters because it is a major influence on success or otherwise of a policy. Equally important is that there must be feedback mechanism because this will determine continuity and change in policy implementation. New strategy adopted by states after evaluating their initial policy response to the coronavirus pandemic amplifies this. It is, therefore, necessary to have these requirements in focus whenever policy making is necessary either in the public domain or in private.

## Synonyms

Causal mechanisms; Causality; Generative mechanisms

## Definition

Causal mechanisms are an explanatory rather than predictive tool used to unpack the "black boxes" defined by empirical generalizations common in policy research. Specifically, mechanisms can be frequently occurring and easily recognizable causal patterns that are triggered under generally unknown conditions and usually with indeterminate consequences. This approach is appropriate for public administration, public policy, and governance research because it is often based on small N between-case and within-case studies. In testing hypotheses associated with causal mechanism, process-tracing methods are often used.

## Introduction

Issues of causality are infrequently discussed within the public policy and public management disciplines. Positivism and interpretivism are the two most popular approaches. The underlying notion of causality underpinning positivism is one of simple event regularities; that is, there are constant conjunctions of empirically observable, measurable, and predicable events. In contrast, interpretivism is based on the idea that reality is subjective and socially constructed. This view of the social world is constituted by human meaning and sees the main task of research as exploring and understanding subjective human viewpoints. Here, the importance of causality is minimized because all explanations are merely personal or group viewpoints and have to be judged.

However, both of the approaches can be limited for policy researchers who are interested in explaining phenomena such as the policy process because they are often "black boxed." The causal mechanism approach has become a popular third perspective used to identify the specific details about the cause-and-effect relationships between policy-maker attention to policy problems and their receptivity to policy solutions. When the nature of the mechanism is understood, then it becomes possible to apply rigorous methods and make inferences.

## Thinking Mechanistically

There is large "mechanisms" literature, which is influenced by the natural sciences and philosophy of science. Mechanisms are sets of entities and activities organized to produce a regular series of changes from a beginning state to an ending (McAdam et al. 2008). They usually "invoke some form of 'causal agent' that is assumed to have generated the relationship between the entities observed and are analytical constructs that provide hypothetical links between observable eventss" (Hedström and Swedberg 1998). Often mechanisms are generally unobservable or hidden phenomena, sensitive to variations in context, but empirically traceable processes that act as a cause in generating the outcome (Pawson and Tilley 1997). Assessing the logic of association helps us open the black box of the limited X → Y causal inferences so prevalent in the social sciences. Causality is not simply a functional description of a certain variable but requires uncovering how X actually produces Y under specific conditions. Rather it is a theoretical formulation that "adduces properties of the relationships among phenomena with the potential to recur, which helps explain why x causes y" (Hall 2013, p. 21). What is important is the context to this relationship and the role it plays in determining outcomes. Initial conditions play a key role in determining how mechanisms are triggered and how they respond to certain contextual conditions. Identifying the context and the mechanism is important when formulating research hypotheses. It is critical to understand under what conditions that mechanisms are most likely to occur or produce a particular outcome (Pawson and Tilley 1997). Various scholars have adopted "context-mechanism-outcome" (CMO) approach: namely, the observed patterns of (un)intended outcomes can be explained by identifying the plausible causal set of mechanisms within the situational context of the process (Fig. 1) (Pawson and Tilley 1997). Key aspects of a "setting" influence when and how certain mechanisms are triggered and how they play out. Context is also critical because similar initial conditions may lead to dissimilar outcomes (multifinality) and those outcomes can be reached from any number of different developmental paths (equifinality) (Biesbroek et al. 2017).

This more robust understanding of causality permits the opening-up of the black or gray boxes of policy-making. In doing so, researchers will find a diversity of causal mechanisms that affect policy outcomes. At first glance, there are different broad mechanism types: structural (e.g., environment, institutions), cognitive (e.g., individual perceptions and ideas), and relational (e.g., network connections between people). Second, mechanisms can span between micro-level (individual) and macro-level (structural) phenomena (Bunge 1997). Given the multilevel nature of policy-making, these mechanisms are particularly important. These are illustrated in Fig. 2. "Situational" mechanisms occur when social structures or environmental phenomenon constrains individuals' action or shape and beliefs. "Action-formation" mechanisms link individual micro-level activities or behavior to their actions.

Transformational mechanisms are those in which individuals, through their actions and interactions, generate intended and unintended outcomes. Third, researchers need to be aware of the temporal nature of mechanisms which includes the time horizons of both the mechanism and outcome (Beach and Pedersen 2013). For example, some slow-moving causal processes result in a threshold event resulting in a sudden change. In the policy and public management, there are many examples of mechanisms that fit these high-level albeit somewhat abstract mechanisms. It is also critical that more compelling and measurable causal explanations can only be realized if mechanisms are disaggregated from a high level of abstraction, which they label as "processes," "mechanisms-as-type," and "mechanisms-as-example" which explains why things happen. Making a measurable causal claim and describing how things happen require attention to "mechanisms-as-cause" and "mechanism-as-indicators (Falleti and Lynch 2008)." Thus, mechanisms are often nested hierarchies that contain "lower level entities, properties, and activities" that "produce higher level phenomena" (p. 13). Machamer et al. (2000) borrow from

molecular biology and find that mechanisms "bottom out in descriptions of the activities of macromolecules, smaller molecules, and ions" (p. 14).

## Mechanistic-Based Policy Analysis

Process-based analysis is critical because "when the procedural sides of a policy making or decision-making process have been thought through properly, it will greatly increase the likelihood of substantive problems being resolved" (Mayer et al. 2013, p. 181). The policy research and analysis communities should be interested in testing policy mechanisms so as to measure policy-oriented causal inferences and explain outcomes in more practical terms. Policy and public management research is often based on small N between-case and within-case studies. When the mechanisms are known, analysts can collect diagnostic evidence, theorize variables and empirical proxies, and test hypotheses which then provide a narrative explaining how a particular outcome or set of events came about (Kay and Baker 2015).

Source: Pawson and Tilly (1997)

**Policy Mechanisms, Fig. 1** Context-mechanism-output (CMO) model. (Source: Pawson and Tilley 1997)

Testing hypotheses can be achieved through rigorous methods such as process tracing and qualitative comparative analysis (QCA) which are two popular methods for capturing causal mechanisms in action. Rather than testing for probability, analysts consider necessary and sufficient conditions as their criteria (Kay and Baker 2015). Necessity refers to the situation that the outcome cannot be produced without a condition, whereas sufficiency refers to the situation in which a condition itself can produce the outcome without the help of other conditions. Process tracing can involve understanding a simplistic change of events related to a single phenomenon, the convergence of a number of conditions, or complex interactions causal factors (Meyfroidt 2016; Trampusch and Palier 2016). This is often achieved by converting narratives into mechanistic explanations. Beach (2017) argues that analysts can develop minimalist or systematic understandings of mechanisms. A minimalist approach considers only diagnostic evidence.

Adapted form Hedström and Swedberg (1998)

**Policy Mechanisms, Fig. 2** "Bathtub" approach for identifying different levels of mechanisms. (Adapted from Hedström and Swedberg 1998)

A systematic approach explicitly unpacks the causal process and delves into understanding the empirical fingerprint that the mechanism makes and unpacking it into its constituent parts. In part, this can be a function of the variety of information sources collected (archival documents, interviews, reports, memos) that are accumulated over a given period of time (Charbonneau et al. 2017).

Beach and Pedersen (2013) identify three types of "process tracing": theory testing, theory building, and explaining outcomes. Theory-testing process tracing is employed when a phenomenon X is causing outcome Y that is known but the mechanism is not specified. Since mechanisms are portable concepts, they can be applied by policy researchers to further elaborate the long-term nature of policy change. Alternatively, in theory-building process tracing, the relationship between X and Y is detected, but the researcher cannot identify the mechanism or when the outcome (Y) is known, but X is unknown. In both cases, the researcher develops a new mechanism. Beach and Pedersen (2013) describe Janis' (2013) development of "groupthink" mechanism as the cause of the Bay of Pigs fiasco. Theory building would require considerably more time and effort than theory testing. In explaining-outcome process tracing, the outcome (Y) is known, but X is unknown, or the researcher is interested in fully explaining why X happened. In each type of process tracing, the analyst will develop a causal mechanism. The second step involves operationalizing the mechanism based on "observable manifestation" from different types of evidence. From collecting such information, the inferential weight of the evidence and the hypotheses can be assessed using four well-known tests that apply Bayesian probability (straw in the wind, hoop, smoking gun, and double-decisive tests) (See Van Evera 1997). These tests examine necessary and/or sufficient conditions for inferring evidence from the hypotheses that exist. The principles of certainty and uniqueness of the evidence reflect the necessary and sufficient conditions. The straw-in-the-wind test supports or weakens a hypothesis but does not exclude it. The smoking-gun test confirms the hypothesis but does not exclude other hypotheses. Hoop tests reject a hypothesis but do not influence other hypotheses. Finally a double-decisive test confirms a single hypothesis and disconfirms other rival hypotheses. Often researchers will be interested in comparing a number of cases, for example, comparing climate change policy in a number of jurisdictions. Qualitative comparative analysis (QCA) is popular approach which applies set theory and conceives cases as configurations of attributes. QCA examines thes necessary and sufficiency of configurations of conditions combined to generate outcomes and enable causal interpretation (Ragin 2014).

## Conclusion

Causal mechanisms have been overlooked because they are usually hidden but are sensitive to variations in context. A toolkit equipped with well-elaborated mechanisms is not only useful for precision and depth to understand the generative processes of existing theoretical models but is also valuable for empirical research and enhancing policy-making decisions (Tranow et al. 2016). Thus, the policy scholar, scientist, and public official can benefit from deeper understanding of causal mechanisms. Policy scholars should take up the challenge and identify more specific mechanisms via process tracing in existing social science theories or develop new mechanisms. This may lead to improving, changing, or refuting the broad and sometimes vague assumptions about existing theories and frameworks. By doing so, academic researchers will be able to undertake richer empirical work.

# Policy Network and Governance

Ferdous Arfina Osman
Department of Public Administration, University of Dhaka, Dhaka, Bangladesh

## Synonyms

Network governance; Policy-governance nexus; Public policy governance

## Definitions

**Policy Network** can be defined as specific structural arrangements in policy making. Policy network analysis focuses on the links and interdependence between government and other societal actors, aiming to understand the policy-making process and public policy outcomes.

## Introduction

Recent decades have witnessed a proliferation of research analyzing and examining the changing trends of policy making process. Traditional approaches to policy-making emphasized on explaining the policy process as an intellectual, centralized, and hierarchical process, which is no longer considered adequate describing the policy process in modern times. In current complex societies where governments have to deal with greater expectations of citizens, accommodation of diverse interests, and fragmentation of social and political life, a more nonhierarchical, decentralized, and participatory approach to understanding the policy process is desirable. Policy networks, thus, have emerged as an alternative approach to the conventional way of analyzing the policy process, which focuses on interrelationships among public, private, and societal actors involved in the policy process as the

determinant of policy outcome. Atkinson and Coleman (1992) noted, "policy networks are natural conceptual responses to both the limits of markets and hierarchical arrangements, and the enormous expansion in the types of societal actors involved in policymaking and to the dispersion of specialized policy resources."

The concept of policy network has widely been used to analyze policy process since the 1980s, which is now frequently characterized as a new system of governance. In modern times, likewise policy making, government also needs to rely on networks of private and societal actors for public problem solving or for public service delivery. Networks between public, private, and nonprofit actors, thus shape processes of policy making and governance. This piece of writing aims to clarify the concept of policy network and its relation with governance.

## Defining Policy Network

It is unlikely that public policy could result from the preference of any single actor. This emphasizes that it is not the formal institutional arrangements or governmental institutions, which solely control the policy process rather many informal, private actors, and institutions also play influential role. The process, in fact, tends to blur the boundaries between the public and the private spheres. Policies are essentially the outcome of interactions among multiple actors with separate interests, perceptions, and strategies. The concern about the interaction of this large variety of actors and its impact has given rise to the concept of "policy networks."

Policy network analysis focuses on the links and interdependence between government and other societal actors, aiming to understand the policy-making process and public policy outcomes (Rhodes 2008). Kenis and Schneider (1991: 41) defined policy networks as "specific structural arrangements in policy making." They explained this structural arrangement as having three key components: the policy actors, their linkages, and the policy boundary. Network is a set of public and private actors linked by communication ties for exchanging information, expertise, trust, and other political resources. The boundary of a given policy network is not in the first place determined by formal institutions but results from a process of mutual recognition dependent on functional relevance and structural embeddedness.

The overarching goal of policy network analysis is to understand how relationships between actors involved in policy making determine the outcomes of collective policy decisions (Knoke 2011). To this end, policy network analysis consists of two distinct components: (i) actors involved in the policy making process and (ii) the type of social interactions that occur between actors during the policy making process. "Network" establishes a relatively stable relationship among varieties of actors, who share common interests with regard to a policy and exchange resources with each other in order to pursue the common goals.

Definitional disputes often prevail among the terms "policy networks," "policy domains," "policy communities," and "issue networks." "Policy domain" refers to a set of actors with common orientation and concern for solving a policy problem. The policy domain and policy network concepts are interrelated, with a policy domain delineating a bounded system within which its organizational participants are interconnected by one or more policy networks (Wu and Knoke 2013). "Policy community" used in British literature, on the other hand, refers to all actors or potential actors who share either an interest in a policy area or a common "policy focus" and who, over time, succeed in shaping policy while "policy networks" describe the linking process that occurs within the community (Wilks and Wright 1987). Similar distinction has been drawn by Coleman and Skogstad (1990) who referred "network" as "the properties that characterize the relationships among the particular set of actors that forms around an issue of importance to the policy community." Thus, the "policy community" refers to the actors; the network refers to the relationships among actors.

In contrast, "issue networks" – a concept established in literature about United States

government – refer to a policy making process that is fragmented and populated by a wide and unpredictable number of participants, where a relatively large number of stakeholders are involved. An important characteristic of "issue network" is that membership is constantly changing, interdependence is often asymmetric, and – compared to policy communities – it is harder to identify dominant actors (Heclo 1978). It refers to less formal settings and involves policy actors within particular issue areas, such as health, education, or communication. Each of the policy areas develops its own distinctive channels of communication, even terminology to discuss policy issues.

## Types of Policy Networks

Every policy domain is composed of a wide number of organizational actors from both public and private sectors and their role, interests, and influence over the policy process vary from each other. Given the diversity of organizational interests, limited resources, and complexity of influence dynamics, no organization can have the capacity to exert full control or dominate the process of policy making. Instead, most policy fights consist of multiorganizational coalitions brought temporarily together to work collectively on shaping proposals and advocating a specific preferred policy solution to those authorities capable of rendering a binding decision on a particular policy event (Wu and Knoke 2013). Thus, the policy actors are interdependent on each other.

Interdependency among actors is central to the network approach. Actors in networks are interdependent because they need the resources of other actors to achieve their goals (Hazlehurst David 2001). Public and private actors form networks to exchange the resources to achieve their common goal. Knoke (2001: 65) specified *five* basic types of interorganizational relations exhibiting distinctive policy network structures, which include: (i) resource exchange such as money or personnel; (ii) information exchanges range from technical and scientific data to policy advocacy; (iii) power relations include both formal and informal inequalities in authority and dominance, with public sector entities usually controlling more power than private sector organizations to impose their interests in a domain; (iv) boundary penetration meaning two or more actors coordinating their actions for a common goal such as lobbying; and (iv) sentimental attachments are subjective and emotional affiliation expressing solidarity and political support as exemplified by labor unions and social movement organizations.

## Policy Network: Dependent or Independent Variable?

Despite the fact that there had been a confusion among the scholars for long whether policy networks should be considered as dependent or independent variable, recent research works have noted that policy network is both dependent and independent variable. Varieties of factors might influence the emergence and the type of policy networks. Adam and Kriesi (2007) noted that networks vary depending on territorial and functional/domain specificities. They identified three major contexts as the determinants of policy network: *national*, *transnational,* and *policy-specific context*.

National institutional structure is a key determinant of policy networks. The national context can be systematically linked to the distribution of power and the type of interaction within policy subsystems (Adam and Kriesi 2007). For instance, in consensus democracies where power is shared among several forces, power is fragmented within networks while in majoritarian democracy where power is concentrated in the hands of a few institutions, power is concentrated in the hands of few actors within networks. In addition, centralization of the state and the system of interest groups and the interactions between the state and the groups is another determinant of policy network. Degree of centralization in society and in the state is a critical variable in the establishment of policy networks. Greater degree of centralization of either the state or the groups puts them in stronger positions within networks.

Strong associations with greater negotiation skill constitute the key element of the self-regulated pluralist network and strong state leads to a state directed network. If both sides are equally strong, meaning power is concentrated in both sides, interaction patterns are more centralized and consensus oriented, and corporatist networks emerge. On the other hand, when both sides are weak, interactions become competitive (Adam and Kriesi 2007).

Only the national context may not be sufficient to explain the formation of policy networks. The transnational policy environments deeply influence the domestic policy environment particularly in terms of exchange of resources, support, and information. They may also provide the opportunity for the creation of new transnational policy networks (Adam and Kriesi 2007). Examples are abound how the global environment plays a determining role in shaping various public policies in both developed and developing countries.

In addition to the national and transnational factors policy, specific variables also influence and shape the policy networks. Adam and Kriesi (2007) note that policies differ according to the incentives and resources they provide for group formation, the expectations they raise among groups or the masses, their visibility/salience for mass publics, and the traceability of their effects. Policies which invite group formation produce networks with fragmented structures and the policies that are characterized by high expectations, a high visibility, and easy traceability of policy effects may cause conflictual relations as state actors have to defend their positions against important groups and the mass public.

However, in the real world, as researchers note that there is no single determinant of policy networks rather, a complex combination of factors lead to the formation of policy networks.

Differences in structural network characteristics, i.e., the presence and absence of ties/interdependencies, have a significant impact on the policy output (Raab and Kenis 2007). The type of interaction within a policy network determines the form of policy change. In conflictual/competitive situations, one can expect rapid policy shifts, whereas incremental changes are most likely to result in bargaining situations. Cooperative policy structures are likely to maintain the status quo. The degree of concentration of power also determines the potential for change. If power is fragmented potential for change becomes greater while on the other hand, when power is concentrated, challengers lack resources to break the policy monopoly and change becomes slow.

## Network as a Form of Governance

A plethora of literature on network have developed over the last three decades, which posit different meanings/dimensions of policy network. Broadly, as Raab and Kenis (2007) noted, policy network can be understood from three key dimensions: (i) as an analytical framework and as an empirical tool, (ii) as social structure, and (iii) as a form of governance.

Policy network is not a theory rather it is an *analytical tool* for policy analysis. Its analytical value lies in the fact that it conceives policy making as a process involving a diversity of actors who are mutually interdependent (Adam and Kriesi 2007). The central focus of the analysis is the relation between actors as a means of explaining why they behave the way they do and why certain outcomes takes place. Network is seen as a *social structure* with very specific features. In policy making it is characterized by a predominance of informal communicative relations, a horizontal as opposed to a hierarchical pattern of relations and a decentralized pattern of actors' positions (Kenis and Schneider 1991: 32).

Another important dimension of policy networks is that they constitute a *new form of governance* characterized by the predominance of informal, decentralized, and horizontal relations among the public and private actors. The new approach of governance focusses on networks suggesting that state power is widely dispersed and the actors need to coordinate their actions and strategies in order to solve the public problems. Klijn and Koppenjan (2014) defined governance network as sets of autonomous and interdependent actors (individuals, groups, organizations) that have developed enduring

relationships in governing specific public problems or policies. This new form is more than the sum of the actors and their links and more than a combination of elements of hierarchy and markets (Mayntz 1993). As a form of governance, network is characterized by a plurality of actors, as they are found within markets, and the coordinated efforts among them in order to pursue collective goals.

Governments are increasingly faced with complex, "wicked" problems when making decisions, developing policies, or delivering services, and they often find themselves unable to address these issues by themselves because they lack the required resources, knowledge, or skill to do so. Thus, dealing with public problems requires the involvement of multiple actors. For instance, developing social security/welfare policies and their implementation require coordinated efforts of governmental organizations at different levels, bureau of information/statistics, local government institutions, research organizations, non-government organizations, citizens forums, and also collaboration among nation states. Similarly, managing any sort of national crisis or natural disasters or controlling the outbreak of epidemics requires coordinated effort of the government and nongovernment actors. The complexity of these issues and interdependencies between actors result in intensive interactions between actors, which results in the emergence of governance networks. Thus, current complex society requires a shift from a traditional top-down way of problem solving to a more horizontal cooperative approach, called the "networks."

## Complexities in Governance Network

Networks are not simple and straight forward, rather it is complex. Complexity is not simply caused by the fact that multiple actors are present within governance, but it is also due to nature of interrelationships among the actors. Drawing on the existing literature, Koppenjan and Klijn (2004) identified three types of complexities in governance networks: substantive complexity, strategic complexity, and institutional complexity.

### Substantive Complexity

Substantive complexity is about the content of the problem addressed and the nature of solutions under consideration. In many literature, substantive complexity is attributed to the lack of knowledge and information, but in practice, complexity is more caused by the uncertainty and lack of consensus over the nature of problems, their causes, and solutions. Multiple actors may have different perceptions of the problem and may also interpret the available information differently.

### Strategic Complexity

Strategic complexity in governance networks originates from the various strategic choices that multiple actors make with regard to a public problem. As actors may have different perceptions about a problem, they also may have the liberty to make their own choices and strategies for its solution. Not all the actors are often aware of these various types of strategic choices. Such strategic complexity concerns the fundamentally erratic and unpredictable nature of interaction processes within governance networks (Gerrits 2012).

### Institutional Complexity

Finally, governance networks are characterized by *institutional complexity*. Not only does dealing with complex problems, policies, and services require the involvement of various actors, but these actors often work from different institutional backgrounds (March and Olsen 1989). Interactions between actors are difficult since their behavior is guided by outlooks, organizational arrangements, procedures, and rules of different organizations, administrative levels, and networks. Thus, interaction in governance networks is characterized by clashes between divergent institutional regimes and displays institutional complexity.

Klijn and Koppenjan (2014) propose "network management" as a coping mechanism to address the occurrence of deadlocks, breakthroughs, and the consequent policy outcomes in governance networks. Substantive complexities can be addressed by supporting learning processes and arranging joint research. Network management can address strategic complexities by initiating

and strengthening interactions, arranging relationships, and mediating conflicts among the actors. Network management may be used to deal with institutional complexity by engaging in institutional redesign (changing rules, resource distributions, and organizational relationships).

## Conclusion

Policy network does neither have any theoretical grounding, nor it has any precise, concrete definition that can have a universal application. Despite this, network is considered as an immensely important analytical tool for understanding the policy making process. Along with the government, involvement of various social actors is inevitable in the policy formulation and implementation process. The nature of interaction and interdependencies among these actors form the policy network, which plays important role in determining the policy process and the outcome. These patterns of interactions are also helpful to explain governance in larger context. In recent times, political scientists increasingly view networks as an efficient way of governing complex societies.

# Policy Networks as a Form of Governance

Olga V. Mikhaylova
School of Public Administration, Lomonosov Moscow State University, Moscow, Russia

## Synonyms

Governance networks; Integrated government; Network governance; Public governance; Public-private partnership

## Definition

Governance: The activities of a range of public and private actors which are included as coparticipants and partners in policy-making process.

Policy network: A cluster of mutually dependent but operationally autonomous public and private actors each with an interest in a given policy sector and a capacity to influence the achievement of policy goals.

## Introduction

Public governance practice has changed greatly since the last decade of the twentieth century. The state gives up its dominant positions in policy-making process, expanding participation in this process, creating conditions for public policy-making by private actors, and choosing model of flat hierarchy. The state shifts away from hierarchy towards interactive models which blur the distinction between public and private sectors. In this trend policy networks are becoming an effective hybrid arrangement involving a range of actors representing public, private, and non-governmental institutions.

## Rise of Governance Concept

The "governance" concept is not a new term in social science but since the end on XX century it has undergone serious changes. In particular it became multidimensional and more popular in the world due to the promotion activity of international organizations (WB, OECD, etc.). In its broad meaning "governance" assumes the space of multiple stakeholders' interaction where public problems can no longer be solved by isolated public authorities but require the cooperation of other players (citizens, NGO, business, media, community organizations) and increasing their participation in public policy-making process. In its narrow meaning "governance" reduces to the community level on which self-organized units manage common recourses without government based of mutual trust, informal rules, and practices such as mediation and self-regulation which may be even more effective than public authorities' actions (Ostrom 1990).

International organizations have supplied a new vision of "governance" underlining the necessity of democracy for economic prosperity in developing countries. Principals of "good governance" (participatory, consensus oriented, accountable, transparent, responsive, effective and efficient, equitable and inclusive) are widely promoted in nondemocratic countries to contribute the transfer toward the democracy-oriented world (Woods 2000).

Governance as a theoretical concept in public administration practice implies the view of reality in which the state is no longer a dominant actor in public policy. Kooiman wrote that governance is "the pattern or structure that emerges in a socio-political system as a common result or outcome of the interacting intervention efforts to all involved actors" (Kooiman 1993, p. 258). It is so because modern societies are becoming highly fragmented, and recourses are distributed among wide range of private actors. Besides, the state itself is no longer regarded as a unified and integrated actor capable of enforcing public policy. It involves myriad of different groups within a hierarchy, the members of which are linked by horizontal, informal cooperation (Kooiman 2003).

"Governance" is closely related to the reviewing public policy from the network framework perspective which became popular in 1960s. Authors of "iron triangles" (Lowi 1962, 1969) and "issue network" (Heclo 1978) concepts have claimed that the process of public policy-making is based on complex constellations of actors and resource dependencies, and decisions are made in decentralized and informal environment, in the shadow of official institutions and procedures.

The new, network morphology of the state has reveled in the works of British scientists in 1990s (Rhodes 1997; Jordan and Schubert 1992; Jordan 1990). In particular, their research introduced both the idea of the existence of informal contacts within the state hierarchy, and emphasized their priority to the effective enforcement of the key functions of the state. In other words, the

state institutions are not isolated from each other by the formal separation of powers; they often find themselves in a situation of resource interdependencies for solving problems within their functional specialization, which creates conditions for horizontal interactions, negotiations, mutual accommodation, the search of compromise, reconciliation of contradictions (Bevir 2011). Modification of public administration strategy and turning to network governance became possible due to the assessment of the outcomes and consequences of administrative reforms implemented using New Public Management approaches (Pollitt and Talbot 2004). Those resulted in breaking numerous informal ties between state departments within the hierarchy which had an adverse effect on the quality of public services. However, it has become even clearer that the state operates through networks of mutually dependent organizations and not through independent organizations that are focused solely on achieving their own goals.

In the public administration framework the governance concept is developing in the Dutch scientific school as ideas of network management (Kliin and Koppenjan 2002, 2012; Koppenjan and Klijn 2004; Klijn and Skelcher 2007). From this point of view, to maintain stability, ensure effective performance of its functions, and to meet evolving demands of the society the state has to change its role. It now needs to establish partnerships with NGOs and businesses, interact through negotiations and bargaining. In other words, in order to adapt, the state changes its strategy in dealing with nongovernmental actors – it forms and enters policy networks in various spheres.

In this context the basic principles of network management are formulated. Among them:

1. The state institutions should not have a greater impact on public policy and administration than the nongovernmental institutions.
2. The state, business, and NGOs are equal partners in policy networks which are created in order to develop and implement public policy effectively, efficiently, and democratically.
3. The participation of state institutions in governance networks excludes coercion and pressure mechanisms, in contrast they are aimed at creating favorable environment for the network functioning, improving the quality of relations between network's participants, overcoming communicational barriers between them, and promoting intensive interaction between them.
4. In some cases state institutions may intervene in the network to modify it using "second generation" management tools (motivating desirable actors' behavior).
5. The main goal is searching for consensus between network participants who could have competing interests.
6. Not only state institution could act as a network manager but also nongovernmental.

As a result network governance allows the state, first of all, to achieve its public administration goals to a higher level of quality than it could on its own. Secondly, network participants realize benefits from joining efforts to meet their goals, running thereby self-reproducing mechanism of long-term cooperation, eliminating the need for further strategic interference of the state.

The extension of nonhierarchical interdependencies between state and nonstate participants is a huge challenge for the state, which assumes the rise of public administration complexity. On the one hand, policy networks weaken the influence of bureaucracy, increase the transparency of decision-making process for all interest groups, and successfully mobilize resources to implement decisions. On the other hand, building communication flows, resource exchanges based on the development of informal interaction channels cannot be ultimately legitimized in public domain where it is critical to ensure that lines of accountability of each decision-making process are transparent and justifiable to citizens. Thus, a modern state based on policy networks as a form of governance has to seek balance between formal rules and informal practices. Depending on the extent of shift towards reducing influence of established rules the semantic content of informal practices will change too (from positive to negative), as well as types of networks (from informal contacts in order to achieve goals in a formalized

environment to "state takeover" – discreet privatization of public institutions).

The success of policy networks as a form of governance depends on two key factors. First, there must be trust between the state and nongovernmental actors. It ensures willingness of both parties to invest resources in joint projects and confidence that none of the participants will act destructively towards each other. Second, the state, business, and NGOs alike must have high-level management capabilities. It means that the state institutional framework must be strong enough to hold back the opportunistic partner strategies, and business and nonprofit organizations must possess internal resources enabling self-organization and pursuance of an independent policy in dealings with the state.

## The Impact of Political Regime on Network Governance

Policy networks as a form of governance are different in various types of political systems. Democratic traditions are beneficial for developing cooperation and partnerships, forming networks where participants jointly address current problems of great social importance (social security, environment, etc.). Due to this the state is able to raise additional funds, reduce budget spending, increase the quality of public services, to widen expertise in dealing with poor structured, complex problems (Sorensen and Torfing 2007). Network strategy is very successful in crisis situations, when business and NGOs are supporting the state, providing stability by coordination of horizontal efforts. The reliable network cooperation is possible if the state provides clear, transparent, and unchangeable (fixes) rules of relationships for all participants. Only in such conditions business and NGOs can work out long-term strategies, be open for partnership, and be sure that risks of opportunistic behavior are minimized.

In nondemocratic political systems governance networks are very rare practice. It is explained by several reasons. First of all, nondemocracies belong to the rigid type of the state. They are aimed at ensuring the high level of stability and predictability with flexibility deficit in dynamic environment. Secondly, they are statist states, which are dominated by nongovernmental actors and are not ready to weaken their positions in hierarchical relationships. Thirdly, nondemocratic states are more focused on keeping power and not on the public interests, that is why new public management models penetrate into their political practice very slowly.

Summing up it would be true to say that in nondemocratic political systems governance does not exist in the sense that this model is adopted in democratic political systems. But nevertheless it is reasonable to say that they have networking public management practices. In order not to stretch the concept "governance" it would be acceptable to put it this way.

So, the experience of nondemocratic political systems demonstrates that authoritarian ruling elite also has opportunity to mobilize resources which are spread in the society by networking to fulfill strategic goals. Compared to democratic network governance nondemocratic one is based not on the truly horizontal state-business-public partnership, but on compulsory cooperation initiated by the state. It means that in nondemocratic political systems ruling elite applies mainly power management strategies, forcing business and NGOs to behave in desirable way. It results in decreasing of trust and strengthening atomization in the society, which together are a huge barrier to partnership. The state promotes the idea that its agenda is the most important and is not always, but it does not always match the public agenda. So, business and NGOs have to follow state agenda and contribute to its implementation otherwise they will meet serious difficulties in their day-to-day activity. In other words, without coercion networking is impossible, because both business and NGOs realize clearly that synergy will not bring them benefits. Voluntarily entering in the network, where the state protects its dominant positions and keeps partners at a safe distance, ensures a possibility to do business safely, but not to fulfill mutual goals in a partnership.

Besides, commonly in nondemocratic political systems private actors have extremely low managerial capacity resulting from the suppression of

private initiative and very narrow strategic planning horizon due to highly unpredictable rules for interaction with the state. The state purposefully creates different restrictions for businesses and NGOs. Its key goal is, on the one hand, to support these actors, because without them the state would have unattractive image in the world. But on the other hand, the state cannot allow them to become too strong in order to maintain dominant position in relationships. As a result, businesses and NGOs depend greatly on the political will and it leads to the great deficit of private initiative.

To weaken the private initiative, especially in the third sector (NGOs) and to strengthen democratic façade, nondemocratic systems imitate public nongovernmental activity by establishing civic associations which are fully controlled by the state. Such associations are focused on the state interests only, they fully depend on state financing, but their output is very poor. These associations in cooperation with dependable businesses are the best partners of the state in the networks which are based predominantly on informal, but coercive relationships.

## Policy Networks in Russia

Russian politics and public administration have their particular features which make it impossible to implement the idea of governance as it has been done in European countries. The hybrid nature of Russian political regime restrains the development of trends leading to the changing role of the state in the relationships between business and nonprofit organizations. Moreover, the contemporary orientations of the society toward the state don't contribute to the development of stable partnership. Despite officially democratic trajectory in public policy-making process is declared, actual policy practice demonstrates that a great distance between public and state interests exists, and there is a lack of democratic mechanisms of their convergence. They limit the participation of nonstate actors in decision-making process, and the state is not ready to become a partner for business and NGOs, to change its public administration model from hierarchical to governance, and to abandon pressure management methods.

There are a number of reasons explaining such state of affairs. Among them, first of all, not long history of independent business and NGO existence, they are not strong and stable enough to assist the state to fulfill its functions. Secondly, privileged positions were and still are occupied by huge companies – natural monopolies ("Russian Railways," etc.), oil and gas companies ("Lukoil," "Gazprom," etc.) which are the main taxpayers and they control strategies for Russian budget resources. In this sense large business in Russia is closely affiliated with the state and highly dependent on it due to the opacity of capital accumulation in the early 1990s. Such conditions encourage the state to use their organizational and financial opportunities to implement different expensive projects with the lowest costs for the budget. In contrast, other businesses have no motives for development, also they are weak because Russian economy had import-oriented strategy, which affected negatively the rise of business initiatives in different spheres.

Third, nonprofit organizations activity is relatively new for Russia. If in European countries the rise of NGOs is closely connected to the strong civic society, in Russia for a long time this sphere was poorly developed because of the trust deficit within the society, weak incentives to self-organization, a number of socioeconomic difficulties which Russian society have faced during the 1990s. In the 2000s the socioeconomic situation has demonstrated positive dynamics, but the state has changed the trajectory of political development toward strengthening its dominance in public policy and that trend had a negative impact on civic society and NGOs. In the 2010s the political trajectory has changed one more time in relation to the NGOs, when in the Federal Law on Public associations new notions, "foreign agent" and "unwanted organization," have emerged. It was a crucial moment in Russian public policy, the ruling elite has taken a course on patriotic policy as opposition to the influence of Western political values. It was a reaction on color revolutions events in nondemocratic countries.

The notion "foreign agent" is covered organizations which receive financing support from foreign funds and governments and conduct political activity in Russia. Such a status doesn't lead to the

closure of the NGO, but creates its negative image, and state organizations are forbidden to implement joint projects with them. For many NGOs the requirement to raise only Russian funds is putting them on the brink of survival, because the size of grant support and private denotations is very small. Besides, the state decides which NGOs to give grants and which NGOs conduct projects against its policy priorities; the role of society in this process is reduced to the minimum. Nowadays, more than 70 NGOs are qualified as "foreign agents" ("Memorial" Human Rights Centre, Movement "For Human Rights," "Golos," "Soldiers' Mothers of Saint-Petersburg," etc.).

The notion "unwanted organization" covers foreign or international nongovernmental organizations whose activities threaten the foundation of constitutional system, defense, or national security. These organizations are forbidden to work in Russia, they couldn't have offices, distribute their informational materials, and their staff is subject to the administrative and criminal liability in Russia. In the first edition of the so-called patriotic stop-list the following organizations are included: Soros Foundation, National Endowment for Democracy, MacArthur Foundations, etc.

Evidently, there is a very special environment in which Russian nongovernmental organizations have to perform, it encourages civic society to narrow the scope of its activity, limit it by the state's interests, because in a result just the state decides which NGOs are helpful and which are harmful. Nowadays, the state is ready to support socially oriented NGOs, as far as ruling elite has a clear understanding of all advantages such policy gives. It gives a green light for fund-raising initiatives to help different categories of people in need, volunteer movement. However, these NGOs and initiatives don't cooperate with the state, they compensate social policy failures.

Thus, in contemporary Russia there are little incentives for networking and the rise of governance. The main reason for this is the dominant position of the state which is, on the one hand, more resourceful and powerful than business or NGOs, more attractive for Russian citizens who trust it more than business and NGOs. On the other hand, the ruling elite is not going to weaken its dominant political positions; it is no more democratically oriented, that is why it is continuing to provide policy which will restrain business and NGOs strengthening, produce negative image of unwilling organizations in society.

Meanwhile in Russian public policy extra nonprofit organizations and initiatives exit. They perceive their mission not as providers and suppliers of services for the society, but as inspectors who control the bureaucracy on different managerial levels and contribute public policy implementation announced by the head of the state. The largest one is "Obsherossiskiy narodnyi front" ("All-Russian people's front"). It is not a single organization but coalition of NGOs, they have united under the leadership of Vladimir Putin, in order to control the execution of decreases and orders of the head of the state as well as to fight with the corruption. In fact it is an umbrella structure which was established by the president, includes leaders of some NGOs and State Duma deputies. This coalition has no official controlling powers but at the same time its day-to-day activity affects day-to-day work of bureaucrats in the most sensitive spheres of Russian society (social policy, housing, etc.).

It is difficult to characterize such a cooperation as governance network, because except for the state there are no autonomous participants in this structure – they follow the president's policy course, do not give alternative perspective on the public policy problems, and their relationships are based on full agreement on all the issues. At the same time it is possible to qualify this cooperation as "ego-network" in which the state occupies central position and other participants are pushed to political periphery. Moreover, peripheral participants are not interlinked at all or have unstable interactions not based on any sustainable interdependencies. So, all network participants depend on the state and don't depend heavily on each other.

Although the vast Russian "ego-network" is not similar to governance networks in European countries, it sometimes demonstrates its effectiveness as a mediator between political and administrative levels of the state in the context of sluggish and lacking in client-oriented approach

bureaucracy. "All-Russian people's front" activists respond to a myriad of citizens' messages concerning problems they face. However, even if the problem is solved due to the magic effect of the president's public battering of officials, public administration system doesn't become more client-oriented; problems are solved due to the bureaucrats' fear of losing their jobs because their activity became public. In general, highly centralized administrative system is impenetrable for external independent organizations, but is very sensitive to the artificially created associations inside the system. So, inside the administrative system ruling elite allows some nonprofit originations to act only if they perform their functions being fully aligned with the state and never opposing it.

In spite of the fact the Russian public administration system has still not evolved towards network governance and gives preferences to the acute hierarchical model rather than the flat hierarchy model, some researchers claim that modern Russia as a "network state," underlining negative semantic content of the notion "network." This position is focused on the idea that Russian political space is a symbiosis of informal groups and formal state institutions, in which "the elite groups foster their own special interests by infiltrating institutions, in effect merging with the state, while at the same time maintaining their own position as unaccountable to those institutions. The state is thus chronically weak and subordinate to the networks, yet it is kept afloat as a sort of institutional carcass that the networks need" (Kononenko and Moshes 2011, p. 5). Researchers agree that modern network nature of Russian political system has its roots in the Soviet system. The collapse of the USSR has led to the destruction of highly centralized elite network, whose stability has been supported by the closed recruitment system and in which influential patron depended on the loyalty of network members. In the 2000s this network restored its positions by closing up the recruitment system and exclusion or cooptation of opposition by establishing the "party of power" which plays an integral role for the network participants (Kryshtanovskaya and White 2011).

Russian society also widely uses network practices. According to the R. Rose's classification in the Russian society "premodern" or particularistic networks are proliferated (Rose 2000). They tend to be common in transitional societies with weak institutions and trust deficit in social relations. The impact for networking is state's unresponsiveness to the citizens' needs or inability to meet their demands, and also underdevelopment of other forms of social relations. In other words, these networks are becoming an effective way to solve urgent problems in conditions of high level of distrust in the state's ability to do this. Thus, citizens develop informal contacts outside formal state institutions. Such negative trend is relevant for contemporary society and leads to a great gap between state and society, and doesn't contribute to network governance development based on partnership between public and private actors.

## Conclusion

Policy networks as a form of governance are a common practice in modern democratic states. They are purposefully created by the state in partnership with the civil and business sectors to solve current complex semistructured tasks which makes it possible for the state to materially reduce public spending and at the same time improve the quality of services.

Russian governance experience demonstrates that there are some influential factors preventing partnership development. Business and NGOs are not independent enough, and ruling elite is not going to weaken hierarchical links in public administration and dominant positions in public policy. Still it practices networking, mixing voluntary and compulsory incentives to create cooperative alliances in order to fulfill state's functions and goals, but interests of nonstate participants remain peripheral.

# Policy Pressures and Public Law

Elizabeth Wheat
Public and Environmental Affairs (Political Science), University of Wisconsin, Green Bay, WI, USA

## Synonyms

Interest groups; Pressure groups

## Definition

Political action committee (PAC): A political committee registered with the Federal Election Commission for the purpose of electing a politician or helping advance a legislative agenda. PACs can be established and administered by corporations, unions, membership-based organizations, or trade associations.
Super political action committee (Super PAC): A PAC that emerged after the *SpeechNow.org v. Federal Election Commission* (2010) Supreme Court decision. They can raise unlimited amounts of money and can spend it supporting or opposing a political candidate. They are prohibited from donating directly to a candidate.
Pressure group: Also known as an interest group. They share similar beliefs, goals, or political philosophies and seek to influence policymakers through lobbying, education, direct actions such as protesting, and political pressure.

## Introduction

In the American political system, each branch exerts pressure on the others with the purpose of balancing control and making sure no one branch becomes too powerful. An important piece of this political system is how the public applies pressure to achieve policies. This chapter will focus on how pressures are exerted to achieve public law changes. Specifically, it will look at pressure

groups (also referred to as interest groups), political action committees (PACs), and Super PACs, and strategies to influence policy and law. Case studies from the Chicago Police Department and the Flint, Michigan, lead contamination crisis will be discussed.

## Pressure (Interest) Groups

Also known as an interest group in the United States, pressure groups share similar beliefs, goals, or political philosophies and seek to influence policymakers through lobbying, education, direct actions such as protesting, and political pressure (Shoveller and Nathoo 2002). While some may focus their efforts on politics, interest groups are more likely to focus on narrow issues and on influencing public policies. They may also help getting policies of interest to their members on the political agenda by increasing issue salience and public awareness or by helping draft legislation (Trueman 2015a). This education can be used to put pressure on elected officials and ultimately influence policymaking (Trueman 2015b).

## PACs and Super PACs

Beginning with the first PAC in 1944, the purpose of a PAC is to raise money for supporting the election or defeat of political candidates. The Federal Election Commission (FEC) limits PAC contributions to $5000 per candidate committee in an election, $15,000/year to a national party committee, and $5000/year to other PACs. Individual, PAC, or political party committees may donate a maximum of $5000/year to a PAC. They are required to register with the FEC and provide an address, financial information, and their affiliated organizations which all count towards financial limits (Center for Responsive Politics 2016b). As political campaigns became increasingly expensive, wealthy donors challenged these financial limitations in court.

In 2010, the Supreme Court handed down a 5–4 landmark ruling, *Citizens United v. FEC*. The majority opinion argued the First Amendment protects independent spending by corporations and unions from government limitations. Corporations and unions were recognized as having free speech rights in the form of unlimited financial donations (Krieg 2012). Shortly after this decision, the Federal Court of Appeals decided *SpeechNow.org v. FEC* (2010), which held that for independent expenditure-only groups, limits could not be placed on their financial contributions (U.S. News 2016). The impact on the political system of these rulings is to allow for increases in contributions and the overall cost of campaigns. In 2015, the Michigan Senate proposed codifying *Citizens United* into state law and allowing state-based Super PACs to operate in a similar way as national Super PACs (Gray 2015). Wisconsin is also debating between codification and a ballot measure overturning *Citizens United* for the November 2016 election. Both proposals could change state campaign finance laws significantly (Bottari 2015; Reid 2015; p. 292 n.d.).

Following the court rulings, independent expenditure-only groups, known as SuperPACs, emerged (Krieg 2012). Campaign finance expert Richard Briffault stated, "The rise of super PACs suggests that the real impact of *Citizens United* may be the re-validation of the unlimited use of private wealth generally in elections, not just spending by corporations and unions" (Barnes 2012). Super PACs are prohibited from directly coordinating with a political candidate, but it is not uncommon for them to be run by former presidential aides or individuals with previous political party connections. In the 2012 election, former White House Deputy Press Secretary Bill Burton headed *Priorities USA*, which spent over $18 million dollars to support President Obama's reelection campaign. Mitt Romney's former political director, Carl Forti, ran the board of Super PAC *Restore Our Future*, spending over $60 million to support the Republican candidate (Krieg 2012).

2222 Super PACs reported total receipts of $547,465,624 and independent expenditures of $235,810,461 in the 2016 election cycle as of March 2016 (Center for Responsive Politics 2016a). In the presidential race, Super PACs have spent $64 million with 90% from single-

candidate groups (Blumenthal 2015). These numbers are expected to climb as the November 2016 election gets closer and the parties nominate their presidential candidate. Registered Super PACS must report donors to the FEC on either a monthly or semiannual basis in election off years and monthly during an election year but can choose which reporting frequency they prefer.

PACs and Super PACs are examples of how pressure can be applied through financial contributions on policymakers, thus influencing public law. The following case studies will look at a different type of policy pressure – mobilizing public opinion.

## Chicago Police Department

Following controversial police actions in Ferguson, New York, Baltimore, and Chicago, confidence in law enforcement declined to its lowest rate of 52% approval since Gallup started polling about them in 1993. From 2014 to 2015, Democrats reported the greatest decline of 13 points to 42% confidence compared to the previous 2 years, while independents and Republicans reported no change, remaining at 51% and 69%, respectively. When looking at approval by race, black respondents reported 30% in 2014–2015, down 6% from the previous 2 years; Hispanic respondents reported 52% approval, down from 60%; white respondents reported 57%, down 3%; and self-identified nonwhite respondents indicated 42% confidence, compared to 49% previously (Jones 2015).

These responses suggest there is growing public concern over law enforcement actions. Citizen advocacy groups have called for changes in police techniques and emphasized the importance of good community relationships between police departments and the people they serve. At the same time, law enforcement organizations have continued lobbying politicians in Washington, D.C., spending $2.5 million in 2013 (Rucke 2014).

Chicago is an example of compelling political leaders to address alleged instances of police misconduct and of the public applying pressure with the hopes of enforcing existing conduct laws and seeking justice. Following a series of deadly police shootings of young black men, citizens and local leaders called on Mayor Rahm Emanuel and the Chicago Police Department (CPD) for greater transparency and accountability. The 2014 shooting of Laquan McDonald, a 17-year-old black teenager, was particularly controversial because the city initially opposed the release of dash-cam video and only requested it be made public after a federal judge ordered the release of video from another shooting in 2013 involving an unarmed 17-year-old black teenager named Cedrick Chatman (Guarino 2016). Public protests calling for Mayor Emanuel's resignation grew louder when discrepancies emerged over when he knew police accounts of the 2014 shooting differed from the dash-cam footage. Bishop Larry Trotter commented, "We are hurt, disappointed, and angry. The mayor has been friendly towards many ministers, but his administration has failed all Chicagoans." A lawyer for the McDonald family stated, "I submit the graphic dash cam video will have a powerful impact on any jury and the Chicago community as a whole. This case will undoubtedly bring a microscope of national attention to the shooting itself as well as the city's pattern, practice, and procedures in rubber-stamping fatal police shootings of African Americans as 'justified'" (Guarino 2016). Chicago's law department responded that the city is working to balance calls for public transparency with the need for confidentiality of police investigations (Roberts 2016).

## Flint, Michigan

In the summer of 2015, Flint citizens discovered their tap water contained high lead levels (Delaney and Lewis 2016). The Environmental Protection Agency (EPA) recommends localities take action if lead levels in water exceed 15 parts per billion (ppb) – Flint's levels tested at or higher than this in nearly 400 homes. Over 90 homes had levels in excess of 100 ppb (Lin and Park 2016).

The lead crisis dates back to March 2013 when the Flint City Council, under the control of a

governor-appointed emergency manager, voted 7–1 to stop purchasing water from Detroit and instead get water directly from Lake Huron, an effort expected to save Flint $19 million over 8 years (Egan 2015b). Detroit opted to stop selling Flint water earlier than this new plan could be implemented which led to Flint choosing to use water from the Flint River, one of the most degraded Saginaw River tributaries. Mayor Dayne Walling celebrated the choice on April 25, 2014, saying, "Water is an absolute vital service that most everyone takes for granted. It's a historic moment for the city of Flint to return to its roots and use our own river as our drinking water supply" (Aker 2016).

An important characteristic of the Flint River is that its poor water quality corrodes lead-infused pipes and risks contaminating the public's drinking water supply unless the pipes are treated prior to consumption. The Michigan Department of Environmental Quality (MDEQ) did not require this treatment be done to reduce the corrosion or leaching of lead from the city's aging pipe system and MDEQ spokesman Brad Wurfel said, "anyone who is concerned about lead in the drinking water in Flint can relax" (Delaney and Lewis 2016). The City of Flint failed to treat the pipes for corrosion and thousands of residents were then provided with dangerous lead-contaminated water (Egan 2015a).

Flint resident LeeAnne Walters noticed her four children becoming sick during this time, contacted her pediatrician who notified the city, and had her water tested in November 2014. The Walters' family water tested at 397 ppb, well above the EPA action level of 15 ppb to avoid damage to the blood, brain, and kidneys. After the mayor failed to respond, Walters contacted the EPA and civil engineer Marc Edwards. Edwards' testing of Flint water customers yielded shocking results and put even more pressure on the city and state political leaders to act. He remarked, "If a landlord with no training in public health doesn't inform a tenant of a lead hazard, they can and have been sent to jail. That's how seriously society takes this issue. So what should be the fate of someone paid to do a specific job of protecting the public from this neurotoxin and fail? If we're going to throw a landlord in jail. . .how can you not hold these guys accountable" (Aker 2016).

The public outcry over the water quality and government response grew louder once elevated lead levels were discovered in the fall of 2015. Pediatrician Dr. Mona Hanna-Attisha found high lead levels in over 1700 children and published her findings in the American Journal of Public Health, officially documenting findings of a spike in the blood levels of Flint children. She argued, "The poisoning of an entire population was entirely preventable" (Hanna-Attisha et al. 2016; Delaney and Lewis 2016; Aker 2016). Residents complained, marched to City Hall, called for the city to reconnect to the Detroit system, and over 26,000 signed a petition to end the Flint River supply (Wang 2015). Flint switched back to Detroit's system on October 16, 2015 and announced plans to prepare the connection to Lake Huron. Governor Rick Snyder declared Flint to be in a state of emergency on January 5, 2016 and said, "I have a degree of responsibility" amid questions over when exactly he knew about the severity of the lead contamination (Aker 2016). A week later, the National Guard was called in by a state executive order to help distribute emergency water supplies (Schneider and Eggert 2016).

A class-action federal lawsuit against Governor Snyder, the city of Flint, and 13 public officials was filed in November 2015, alleging families were "deliberately deprived of their 14th Amendment rights" when Flint chose cheaper toxic water. The complaint states, "For more than 18 months, state and local government officials ignored irrefutable evidence that the water pumped from the Flint River exposed [residents] to extreme toxicity. The deliberately false denials about the safety of the Flint River water was as deadly as it was arrogant" (Wang 2015).

Governor Snyder requested $200 million in aid from the state and Senator Debbie Stabenow (D-Michigan) sponsored a bill requesting federal funding for Flint and cities in similar situations to upgrade their pipes. If passed, this bill will "provide $100 million in 'drinking water state

revolving funds' available to any state with a drinking water emergency; provide $70 million to back water infrastructure loans; and provide $50 million to prevent and address lead poisoning" (Helsel 2016). Public frustration over how the city and state government handled the process led to Flint's emergency manager resigning and the Department of Justice launching an investigation into Governor Snyder's office beginning January 2016 (Rappleye et al. 2016). Concern over lead levels and its harmful effects have not stopped at the Flint city boundaries. The crisis has ignited action throughout Michigan and nationally, as citizens call for threats to their water supply to be investigated and contamination problems resolved (Wines and Schwartz 2016).

The Flint crisis is an example of citizens mobilizing to enforce public law and pressure policymakers. The Midwest program director for the Natural Resources Defense Council feels the crisis may also lead the public to reconsider the value of water, "We see safe and sufficient water as a human right," he said. "It needs to be approached as a public service matter, not a private commercial commodity... It doesn't just come out of the wall" (Wines and Schwartz 2016). If not for the actions of local pediatricians, engineers, and concerned parents, harms from the lead contamination would likely have continued and done more damage. Due to public mobilization and pressure, residents of Flint should receive clean water and resources to address health effects from the contamination.

## Conclusion

Public pressure can change an existing policy, clarify existing ones such as police protocol with civilian shootings, create a new policy, or enforce existing laws as observed in Flint. The American political system provides an abundance of opportunities for the public to get involved in making policy and changing laws. This chapter highlights a few opportunities, but every citizen can seek out ways to become involved in their own community.

## Synonyms

Incrementalism; Policy adjustment

## Definitions

A policy tactic is a minor adjustment within the implementation process of an established policy that could improve its efficacy in achieving its purported objectives. A policy tactic affects the interaction between the state (bureaucrats) and citizens with the use of one or more behavioral change tools.

## Introduction

An extensive stream of literature highlights the political, budgetary, and organizational difficulties facing public administrations to improve the

quality of government. The provision of sound advice has frequently advocated change on policy levels where neither managers, implementers, nor policymakers are able to make on their own. Nevertheless, academic work has recurrently neglected existing ways to overcome these challenges. For instance, what kind of actions do public managers have available to them to increase the effectiveness of the programs they administer? The following entry attempts to answer the question developing the notion of policy tactics. We convey that a policy tactic is a policy-oriented adjustment promoted by the acting policy implementers in an attempt to overcome challenges within the implementation phase, altering the way people behave in such interactions.

## Policy Tactic: Theoretical Foundations

Three assumptions are behind the definition of policy tactic. First, it is an adjustment in the margins within the design or the policy implementation process, aiming to increase the efficacy of the policy according to its explicit objectives. Second, it targets the interaction of the state and the policy targets during the implementation of a policy. And third, a policy tactic intends to facilitate a behavioral change that facilitates the achievement of policy objectives.

## Policy Oriented

Policy tactic has to do with managerial intentionality. Ever since Lasswell's invitation to pursue policy objectives *as if where in times of war* (1951), a number of ideas have emerged to help organize policy activities in a process infused with greater intelligence, backed with evidence and with clear pursuit of the public objectives, particularly in overcoming implementation failures (Winter 2012). A key assumption driving policy tactic is that people make choices under conditions of bounded rationality, which implies that humans decide subject to cognitive limitations (Simon 1997). In addition, the decision-making process is never detached from people's personal preconceptions, beliefs, and emotions. Therefore, gaps will inevitably remain between the goals of a policy and the actual behavior of people. Dealing with these noncompliance problems (Weaver 2015), public managers design tactics with the explicit aim of aligning the behavior of bureaucrats and citizens or policy targets within the established goals of a public policy. Therefore, a policy tactic is built explicitly within the values of a public policy frame: it does not attempt to change it, but facilitate its achievement.

## Interactive Window

Importantly, policy tactic affects the interaction between the bureaucracy, say street-level bureaucrats, and the citizen or the policy target for which the policy is targeted. Implementation research has paid much attention to this interaction window. Widely accepted is the idea of bureaucrats being powerful actors with a significant degree of discretion in the interpretation and implementation of policies, which affect the outcomes (Lipsky 2010). In other words, frontline workers are de facto policymakers.

However, more recently, studies have pointed further to the idea of bureaucrats applying different rule-following identities driven by intrinsic personal conditions and contextual factors (May and Winter 2007) or in accordance to a more sympathetic behavior which heavily depends on the quality of interaction between them and the citizen/clients. The idea behind policy tactic does not quickly regard *policy implementation divergence* as an abnormality, but as an inherent opportunity to seize the moment in favor of more efficacious action (Gofen 2014, p. 477). In that sense, policy tactics closely follow a constructivist idea of the state-citizen interaction similarly as argued by Schneider and Ingram (1993), where policies help to construct an idea of the target groups, by defining who is deserving of government attention and who is not. This ultimately affects the functioning of the policy system.

Operations in the construction of a policy tactic resembles Richard Elmore's backward mapping strategy (Elmore 1979), which opposes the predominant hierarchical forward mapping view of public policy design. Contrary to the conventional assumption that policymakers can in fact control the implementation of their decisions, the backward mapping approach takes for granted that frontline bureaucracies have considerable degrees of discretion. However, instead of proposing strict controls over bureaucratic discretion, Elmore advises to start from the last possible stage, where frontline bureaucrats interact with the target population. If policy designers actually want to change behaviors at the very microlevel of implementation, they should ask themselves the following two questions: what is the ability of the lowest unit to affect the behavior that is the target of the policy? What resources does the unit require in order to have the desired – in terms of the policy goal – effect? Having established the goals and resources at the last stage of implementation, the backward mapping perspective would continue building the overall strategy focusing on each implementation stage. Each of these stages may require the introduction of policy tactics aimed at modifying the behavior of the interacting units.

## Behavioral Nature

Behavior change is the main goal and mechanism in a policy tactic to increase the efficacy of public policy. Considering that one of the leading roles of the state is to absorb the risks associated to community life, transforming the behavior of countless people is an essential task for public policies. However, such a complex undertaking requires a clear understanding of the factors influencing people's behavior and selecting the appropriate policy tools to induce behavioral change (e.g., regulation, information, and incentives, among others). From an instrumental rationality point of view, changing behaviors implies that policy design should rest on solid causal frameworks ensuring coherence between policy goals, behaviors, tools, and outcomes. The notion of policy tactics does not demand such a comprehensive rationality assumption, but only a more modest, although more pragmatic, one: "rationality is concerned with the selection of preferred behavior alternatives in terms of some system of values whereby the consequences of behavior can be evaluated" (Simon 1997, p. 84). This implies that organizations and their managers can provide people with informational and psychological environments to adjust individual behaviors and preferences with collective goals, without relying exclusively on more conventional mechanisms such as incentives or sanctions. Policy tactics assume that public organizations can exert influence over low-level bureaucrats and citizenship in multiple ways, but mainly by altering the heuristic model of individual pre-decision's framework under which frontline bureaucrats and citizen interact. This closely resembles Thaler and Sunstein's argument on human cognitive biases, which often prevent people from making sensible choices regarding their own well-being. The latter had served to justify the use of *nudges*, defined as "any aspect of the choice architecture that alters people's behavior in a predictable way without forbidding any options or significantly changing their economic incentives" (Thaler and Sunstein 2008, p. 6). Policy tactics, on the other hand, does not exclusively subscribe to the rational-instrumental paradigm behind nudge theory; however it highlights the power to change behavior by reconstructing the meaning of interaction between the state and citizens throughout non-rationalistic mechanisms. Examples of these have been presented elsewhere (see Jones et al. (2013); Meza and Moreno-Jaimes (2019)).

## Conclusion

Policy tactics is an alternative way to understand how public managers improve the implementation of public policy without making comprehensive

changes either to its design or to the organizational and institutional settings, something that generally is beyond their formal powers. Policy tactics operate within the limits of the established policy goals, which fulfillment they facilitate through small adjustments in the implementation process, aiming to change the behavior of target populations and/or the agents of the state. Policy tactics is not a prescriptive notion, but a descriptive one, frequently neglected, on how real-world public managers handle the everyday challenges of implementation.

# Policy-Making for Sustainable Agricultural Development

Tipakorn Senathip[1], Bahaudin G. Mujtaba[2] and Frank J. Cavico[2]

[1]Institute of International Studies, Ramkhamhaeng University, Bangkok, Thailand

[2]The H. Wayne Huizenga College of Business and Entrepreneurship, Nova Southeastern University, Fort Lauderdale, FL, USA

## Synonyms

Farming; Policy-making; Rural development; Strategic planning; Sustainability

## Definitions

- *Sustainability* is the ability of an organization and its employees to effectively and efficiently manage their core economic responsibilities in maximizing long-term value while proactively respecting the environment and being accountable to all stakeholders in a transparent and timely manner.
- *Agriculture development* refers to the idea of policy-makers providing assistance and resources to farmers and crop producers along with relevant assistance in research, best practices, technology, and pest control recommendations.

## Introduction

Leaders in both private and public sector organizations play an important role in bringing about positive and necessary developments in society. This function is especially an important consideration for public sector policy-makers when they look at the long-term effects of policy-making in economic and agricultural development. Farmers and citizens of any agrarian society tend to depend

on the availability of local resources for their survival and independence. Furthermore, agricultural developments are important for communities to live in a sustainable manner using local products and resources.

This entry (A comprehensive version of this topic was published in *Economy* as follows: Senathip et al. (2017).) reflects on policy-making for economic progress, its importance, and how local leaders can take a developmental role in devising agriculture and sustainability approaches for local farmers, consumers, and communities. Suggestions and recommendations are provided which the authors trust will result in the betterment of people and the sustainability of societies.

Over the past decade, we have seen that many modern researchers focused on the responsibility of taking care of local communities, society as a whole, and the planet by being "sustainable" environmentally and in all aspects of life and work (Senathip et al. 2017). In some cases, one has seen friendly and even not-so-friendly protests when people are not happy with their current situation, especially economically, and want positive changes in their living and/or work environment. Fortunately, many people are now voluntarily trying to reduce waste, reuse what they can, recycle as much as possible, and renew by planting seeds or trees to replenish natural resources and by respecting the environment while keeping it clean and "green" (Cavico and Mujtaba 2016). Many companies and businesses are also going "above and beyond" the law and legal requirements to conserve energy and in some cases to actually produce energy; these companies are positive examples of "sustainable" firms.

Sustainability is defined as "the ability of an organization and its employees to effectively and efficiently manage their core economic responsibilities in maximizing long-term value, while proactively respecting the environment and being accountable to all stakeholders in a transparent and timely manner" (Mujtaba et al. 2016, p. 679). Mujtaba's long-term view of sustainability will be used in this research since highly ethical people are likely to be driven by decisions that respect people and the environment while enhancing the quality of life for everyone in society.

## Policy-Making and Development

According to Rissmiller (2000, p. 1), many writers and researchers ask how can we understand the "incredibly complex" process of policy change? Of course, there are many models and answers which have made important contributions to this understanding; but a good majority of them tend to rely on theory that is general in scope or very narrow and specific to a particular agency's decision processes (Easton 1965a, b). As such, they are difficult to apply to all situations and cases. Some models are reliant on a single case which has a limited score of utility. Yet other models are derived from multiple regression or even more sophisticated statistical analysis that disregards dynamic change and situational variables. Thereby, some believe that the "scientific approaches to the study of policy-making processes are ill-designed to confront the apparently tremendous influence of personalities and chance events, the unique features of policies, and the unique and diverse range of environments in which policy is made" (Rissmiller 2000, p. 1). Rissmiller and other authors have recommended that the goal of policy theory should be to assist in understanding the role of causal elements in policy development regardless of whether they appear to be irregular and diverse or uniform and predictable. Accordingly, it is recommended that political scientists need to think and see "holistically" and thus to utilize systems thinking in their developmental policies. Unfortunately, systems thinking and dynamics are not taught in most political science curriculums and programs. However, systems thinking and dynamics have thrived in business applications due to the continuing work and commitment by people like Peter Senge and others at the Massachusetts Institute of Technology's (MIT) Sloan School of Management.

Theory building and systems analysis have generated considerable interest in political sciences over the past century, especially up to 1965, as stimulated by David Easton's writings on *A Systems Analysis of Political Life.* Easton's work has been influential due to the fact that systems analysis has been identified as one of a

handful of primary approaches to the study of political science and public policy (Rissmiller 2000; Anderson 1997; Dye 1998; Susser 1992).

According to researchers and writers (Jenkins 1978), public policy is defined differently by different authors, including the following definitions:

1. Public policy is whatever governments choose to do or not to do.
2. Public policy consists of political decisions for implementing programs to achieve societal goals.
3. Public policy is a purposive course of action followed by government in dealing with some topic or matter of public concern.
4. Public policy is the authoritative allocation of values for the whole society.

Public policy is defined "as a set of interrelated decisions taken by a political actor or group of actors concerning the selection of goals and the means of achieving them within a specified situation where those decisions should, in principle, be within the power of those actors to achieve" (Jenkins 1978, p. 44). Such a definition is not all-encompassing as it does not build *implementation* into the policy. As such, one does not always consider how a policy might be implemented. This definition makes clear that a *Policy is more than a single decision* as it can involve many actors/stakeholders (Ventriss 1989). Policy-making often involves a pattern of actions that extend over time and that might go through many decisions. Nonetheless, some critical points for consideration of such a definition and model can include the following elements:

- It integrates the possibility of *inaction* (the decision not to move).
- It separates policy from ambition.
- It links policy decisions to available resources.

All policies tend to have multiple direct and indirect stakeholders. A *stakeholder (actor)* can be any person, group, or institution that has an interest in a development activity, project, or program.

The stakeholder definition includes both intended beneficiaries and intermediaries, "winners or losers," and those involved or excluded from decision-making process. Therefore, public policy should be considered as much more than simply governmental "outputs" because simply focusing on output alone may result in a partial and incomplete view of the dynamics and totality of public policy (Miyakawa 2000). Policy analysts, therefore, should deal with the separation of content and process, to wit: (a) *policy content* – the substance of policy – and (b) *policy process*, the given set of methods, strategies, and techniques by which a policy is made (Jenkins 1978).

Overall, one can summarize that policy-makers should focus on *how* policies actually govern; and they should ask other questions that relate to *why* a policy must govern as they consider the ultimate well-being of all people in society (Rissmiller 2000). As part of the policy development process, there can be a market orientation which focuses on privatization, marketization, and contracting out, which business actions hopefully will provide competition, thereby making products and services better and cheaper for consumers. There should also be a dialogue orientation in order to focus on interaction between government agencies and civic groups. "Civic responsibility emphasizes obligations that citizens have to their society, and their government" (UNF Lecture 2016, p. 7). Civic responsibility focuses on the relationship of citizens to their government and society and especially the obligations of citizens to their society.

## Economic Development of Nations

The World Development Reports, similar to most of their other similar studies, provide a review of how the world economy is often plagued, beset, challenged, and, at times, overwhelmed by severe economic problems while also paving the way for opportunities toward the growth and development of all nations through specific recommendations for policy-making and implementation. These reports review development prospects in the international economy while offering recommendations

for adjustments and opportunities in industrial, developing, and poor countries. For example, the World Bank's (1982) report found that, although international prospects had become worse in that time period, it also was forecasted that during the coming decade the leaders and policy-makers of the middle-income countries should work on narrowing the income gap between themselves and the industrial countries of the world.

The prospects for some of the low-income countries remained a matter of grave concern for leaders and local policy-makers. According to the report, agriculture remained the main source of income for about 70% of the population in developing countries and for the vast majority of those people who are living in the world's poorest nations.

### Developing Countries

Just a few decades ago, many developing countries were struggling with large debt repayments and saw their problems further exacerbated by the rise in interest payments, adverse impact of regional or global trade, and depressed export volumes. The low-income countries which make up the bulk of where poverty is concentrated seem to have a bleak future lacking major opportunities for education and health development. Perhaps due to centralized and stable governments, heavily populated countries like China and India have managed to maintain consistent growth in the 1970s; as such, these two countries are less likely to be negatively affected by the adverse international environment's changing landscape. However, the smaller low-income countries with large export sectors tend to see more of bleak future in the decades to come. Some of these countries are in Africa and fared badly in the 1970s as they did not receive developmental assistance from outsiders. Their progress has been heavily dependent on the generosity and aid from the international community. Overall, big improvement opportunities are likely to come from reforms in education, health, and better agriculture developments. Over the past several decades, growing interdependence through trade and migrations of people for business has strengthened the forces of economic expansion around the world. In the meantime, these interdependencies have also transmitted challenges and problems from country to country in parallel with the economic benefits.

Data shows that many of the developing countries adjusted better than the industrial countries during the mid-1970s, while the low-income countries were hit hard by the recession at the time. This can be seen from the fact that economic growth was slow in the poorest countries during that time period, despite the improvements made in the quality of life. Perhaps due the interdependence of global community, during the 1970s, most developing countries adjusted fairly well to the turbulent conditions and recession in the world economy. These countries grew about twice as fast as the industrial countries during that decade. The developing countries were able to borrow more income from the international community; and they made good use of their additional resources.

### Development Opportunities

Development prospects for the international economy had worsened in some decades, partially due to the lingering recession in the industrial countries, especially because some of them had leaned toward the threat of taking protectionist measures. Other reasons for the worsening of the international economy could be attributed to the "developing countries' adverse terms of trade and depressed export volumes; high and more volatile interest rates that limit borrowing; and large debt repayment burdens" (World Bank 1982, p. 2). When these challenges are not solved quickly, the barriers to growth could condemn the world to long-term sluggish growth, which can have negative ripple effects throughout the world due to the increased interdependence.

During recessionary times, major priorities for industrial countries should include the restoration of their own economic health and continued growth through the maintenance of a liberal environment for trade. In the early 1980s, while external finance accounted for 13% of the total investment in developing countries (or 4% of world savings), it made important contributions by providing imports of machinery, materials, and

other technological necessities for efficiency. External finance also helped to cushion balance of payment shocks which can be experienced due to economic upheavals and recessions.

In terms of developments, data from the 1970s suggests that most developing countries weathered the economic disruptions and challenges with effective approaches. Overall, local and international policy-makers should stress the importance of several factors such as continually increasing levels of domestic savings and investment, improving the efficient use of available capital, and effectively managing all external debts. Accordingly, it is clear that the foundation for development over the longer term requires the strengthening of economic management by developing an effective strategy for the near future which should include greater priority to agriculture.

## Agricultural Developments

The atmosphere and character of world agriculture has changed significantly and positively during the latter part of the past century. "In the developed countries, scientific research together with the increased use of industrial technology, chemical fertilizers, and machinery have revolutionized production and marketing" (World Bank 1982, p. 4). However, some elements of this uprising have produced widely differing performance and progress.

Data from the last few decades of the past century shows that the industrial countries protect agriculture to maintain parity or equality in incomes generated or earned by farmers and those of other workers in the economy. Some believe that "This protection is extremely expensive unnecessarily so, since it has spurred increases in agricultural output beyond economically justified levels and has seriously distorted international comparative advantage" (World Bank 1982, p. 5). Therefore, the challenge for policy-makers is to adjust domestic policies as needed to build an effective trading system in which mutual comparative advantage can play a positive role in local production. Rapid and relevant progress on a continuous basis through effective policies for sufficient agricultural production is clearly desirable to enlarge the developing countries' access to markets and, in the long run, to ensure that the world's agrarian resources are more efficiently used to increase per capita supplies of food for local, regional, and international consumers.

According to the World Bank report, "continuing progress in agriculture is of vital importance to the developing world," because of many reasons, including the fact that "Close to two-thirds of the population draws its livelihood from agriculture as farmers and farm workers. . .Driven by population and income growth, the demand for food in the developing economies is likely to increase by at least a third over the next decade" (World Bank 1982, p. 89). Agricultural exports have accounted for about 30% of most developing countries' total merchandise export earnings, and they will continue to be "the main category of exports for over two-thirds of these countries" (World Bank 1982, p. 90).

## Development Recommendations

Plainly, policy-makers in the public sector play a dominant and important role in providing relevant infrastructure and large-scale irrigation systems for agricultural efficiency and development. Yet, there are no universal package of prescriptions that can be offered for all nations and economies. The reality is that such elements as nature, climate, feasible cropping systems, available technology and the means to acquire and use it all vary too widely for any simple formula to make sense.

The proper and efficient use of water for irrigation, drainage, and flood control is a major source of increased productivity (Mujtaba 2014 and 2015; U-Tantada, Mujtaba, Yolles, and Shoosanuk 2016). If farmers are able to adopt to and to use new varieties of seeds and apply the right amount of fertilizer, then they must be assured of adequate supplies of water are delivered in a timely manner so they can stay in business and make a small profit that can be applied to the future of their business. Such governmental assistance or aid by the international community has provided high rates of return, though it requires considerable investment and strong leadership by local organizations. Private sector

irrigation and sustainable technology usage remain important factors in boosting agricultural output in all nations around the world. In the future, especially in developing and poorer countries, the size and collective nature of the investments in agricultural developments will require heavy reliance on public sector irrigation. Of course, cooperation of various stakeholders is important as the private sector can complement the work of policy-makers in the public sector (World Bank 1982, p. 50).

The world is adopting to new technologies every single day, while more and more people are moving into bigger cities thereby relying even more on crops of fresh foods. Therefore, "with urbanization and the growth of the cash economy, marketed food production will need to increase very rapidly" (World Bank 1982, p. 6). Adapting to the new environment will require considerable investments by both farmers and governments in crop storage, processing it efficiently and transporting it quickly to retailers and consumers in a timely manner. Consequently, there is a greater need for policy-makers and government officials to carefully consider their respective roles in financing and managing relevant investments for socially responsible long-term growth, adaptability to the changing needs of consumers, and the sustainability of operations in the environment and ultimately of society itself.

Overall, research and technological advancements need to be developed and adapted to local conditions that farmers face each year. Government or internationally financed projects in agriculture developments are often necessary to overcome major obstacles, to demonstrate how to increase output of one's hard work in the crops being produced, and to assist in devising relevant programs to benefit the poorest populations in rising above poverty levels. Oftentimes, major investments in irrigation, transportation, and marketing networks are only available from external sources like the government or international community.

In summary, it is apparent that the world's population is continuing to rise, and, thus, the increase in demand for food has important implications that go well beyond agriculture itself. In the 1980s, about 8% of the food was eaten in developing countries, and 9% of all agricultural products available was supplied by imports. As such, developing countries have had a strong reliance on exports for the consumption of their food supplies. "The past therefore provides a clear guide for the future" (World Bank 1982, p. 91). Now, one sees that the main constraints on agricultural growth do not necessarily lie in the behavior of farmers as they are motivated to work hard and to take advantage of new innovations. The constraints are in the environment in which farmers operate, the technologies that are available to them, the access to usable land, and the incentives for production and investment. Furthermore, other main constraints can include the availability and price of fertilizer, establishment of easily accessible irrigation, and marketing resources.

If the past is any guide, policy improvements could achieve dramatic results. The rise in agricultural output over the past four decades of the last century had confounded the predictions of famine which were common in the 1950s and 1960s. Unfortunately, many people still suffer from shortages of food and suffer hunger and even famine in the modern world. One point that can be made is that: "If agricultural technologies can be improved, additional resources mobilized, and appropriate policies adopted in industrial and developing countries, then faster agricultural growth will be achieved. Economic development, particularly of the poorer countries, will speed up. And poverty will be reduced" (World Bank 1982, p. 93).

## Sustainable Social Responsibility

An important value for current policy-makers and future leaders is to create policies that would encourage people to act in a socially responsible manner by being cognizant of "sustainability," a concept tied to the values of law, ethics, and social and environmental responsibility. The most frequently cited definition of sustainable development was published by the United Nations (Our Common Future, chapter 2, *Report of the World*

*Commission on Environment and Development* 1987, p. 24): "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs." Sustainability is a broad and all-encompassing concept since it can be interpreted as a MEANS (typically in the form of beneficial environmental actions, such as "green" buildings and offices, reducing greenhouse gasses, and otherwise reducing the firm's "environmental footprint") and also as an END (i.e., having a sustainable organization, society, as well as a sustainable planet, for future generations).

An important challenge for policy-makers is that each person is expected to act in a socially and environmentally responsible manner (Cheretis and Mujtaba 2014). The societal expectation of this responsibility is thus above and beyond the law as well as morality/ethics (Cavico et al. 2015). Business, therefore, is expected to be a "good corporate citizen" (even though there may be no legal obligation to do so). Social and environmental responsibility is related to sustainability as a goal; that is, if we restore or preserve our natural resources and communities, we will also increase our chances of sustaining as a business. The old concept of seeing the purpose of business as only short-term profit is being increasingly replaced by a broader and more socially responsible "accounting" framework, which includes three dimensions of measurement: "People, Planet, Profits," also called the "Triple Bottom Line" – economic prosperity, environmental stewardship, and social responsibility (Cavico et al. 2015).

The rationale for being socially and environmentally responsible, and one that must be underscored to the future leaders throughout their socialization in the company, is the maximization of their own self-interest along with that of their firms, communities, and society as a whole. That is, the instrumental worth of being a "socially responsible" person and organization, in addition to being a legal and moral one, will be the advancement of one's own self-interest, the company's self-interest, and the corresponding benefit to community and society as a whole as well as the sustainability of the planet for future generations.

As leaders, we can create the best future by planning for it with specific goals, organizing and devoting relevant resources, having milestones which are precise and can be measured and reported, and specifying action plans that can be controlled. Leadership is about having a vision, influence, and the ability to execute a practical strategy into action; and this ability should be used to make society a little better through the sustainable operations in each organization. The authors have emphasized that the business leader today will confront societal expectations that the business will not merely act in a prudent economic and correct legal manner but also that the business will act in a moral and ethical and socially and environmentally responsible manner. Business leaders in the public as well as private sectors must take the lead in emphasizing legality, morality, ethics, social responsibility, and sustainability in all their decision-making processes.

## Conclusion

The objective of sustainable global leadership and policy-making is to make sure the processes used for economic developments along with their associated outcomes more sustainable. This mind-set is the way to achieve long-term economic success and sustainability; and thus future business leaders must be developed and prepared to do what is the essence of leadership and that is to *know the way, go the way,* and *show the way.* Consequently, the challenge for the policy-maker today is to have that mind-set and thus to fulfill these expectations, meet these challenges, achieve success, and to sustain that success for the business and all its stakeholders including society as a whole, the planet, and future generations.

If public sector policy-makers, leaders, and managers do have a higher level of ethical maturity and sustainability consciousness, then specific positive recommendations will benefit everyone in society so all people can achieve a higher level of ethical, moral, and social responsibility awareness and action and thus contribute to and help build sustainable societies and a sustainable planet for future generations.

## Synonyms

Empowerment; Nigeria; Policy-making; Poverty reduction; Sustainability; Urban development

## Definitions

| | |
|---|---|
| Sustainability | Sustainability is anchored on the three pillars of social, economic, and environmental preservation for the guaranteed present and future generations. |
| Empowerment | A people-focused development initiative that enhances self-reliance and self-esteem, through active participation in the stages of policy process. |
| Poverty | Means the denial of choices and opportunities and lack of capacity to participate effectively in society. |
| Poverty reduction | Strategic policy measures, both economic and humanitarian, which are intended to permanently lift people out of poverty (Ukeje et al. 2020, p. 1). |
| Urban development | Process of enhancing urban services for secure and sustainable environment, prosperous economy, and humanitarian cause and social well-being. |

## Introduction

Public policy-making in the developing countries is a difficult task because of the many problems militating against the process (Okoli and Onah 2010). Primarily, most of the developing countries lack the technical know-how and statistical data for formulating an endurable policy. Again, the political and economic factors tend to compound the problems already facing the policy-makers (Okoli and Onah 2010, p. 253). Individuals, organizations, and the society at large are often faced with various political and socioeconomic problems. If attempts are not made on time to address the situations, the resultant effect is that the problems degenerate into uncontrolled point that tends to render the system difficult to manage. Nevertheless, this is rarely the case, as efforts are often being made by the various categories mentioned above to find solutions to such problems. The solutions are more often than not sought through the decision-making process, whereby a policy option is made to check a named political, educational, or socioeconomic problem (Okoli and Onah 2010, p. 235).

However, a recent study has shown that previous policy efforts in Nigeria lack sustainability component due to poor human capital development (Ukeje et al. 2020) and weak governance structure. Sustainability is anchored on the three pillars of social, economic, and environmental preservation for the guaranteed present and future generations (Turvey 2017). Since its origin in 1972, with emphasis on achieving integration of economic development, environmental protection, social justice, and inclusion, attaining sustainable development has been challenging despite gaining popularity following World Commission on Environment and Development (WECD) Brundtland Report of 1987. More so, the SDGs declaration with targets by world leaders on 25 September 2015 seems unattainable in many developing countries like Nigeria (Ukeje et al. 2019a) where poverty growth rate is high. Absence of sustainability can provide foundation for society-public policy gap. Governance plays a critical role in building and bridging a relationship between society and public policy (Bhuiyan and Farazmand 2019, p. 3). Importantly, certain governance principles are required for sustainable policy-making. In that connection, six core good governance principles, properness, transparency, participation, effectiveness, accountability, and human rights, highlighted by Addink (2019, p. 19) cannot be ignored. Good governance is significant because it is both a norm for the government and a citizen's right (Addink 2019, p. 4). Service of the people not for its own sake to the extent the people institute and constitute it is the essence of good/sound governance (Offu et al. 2018). Sound governance, as critically conceptualized by Farazmand, has as its constituent elements comprehensiveness, autochthonous governance regimes, competence, societal cultural base, inclusivity, and internationally acceptable values (Farazmand 2012, 2017). Importantly, sound governance is proposed in response to the fundamental flaws of "good governance," a

concept Farazmand borrowed from the ancient Persian Emperor Darius the Great (521–480 BC) whose comprehensive administrative reforms were considered essential for a "sound economy and administration" of the world's first and largest empire – the One World State of the Achaemenid Persian Empire (Farazmand 2004, 2009, 2012).

Shaped by these principles, citizens' empowerment and poverty reduction are key strategies for sustainable urban development. Due to prevalence of rural poverty and search for a better life, cities have become homes to many for inherent prosperity and economic growth potential (Keivani 2010; Zhang 2016; Madeleine 2016; Panwar and Thapliyal 2017), hence the rising urban growth vis-à-vis high natural growth rates (Tacoli 2008). But, upon arrival in city, rural migrant family come face to face with reality of unavailable or inaccessible housing, incomes, jobs, and amenities making them unfit to live there amidst growing deviance. The fast urbanization and rapid rural-urban mobility in Africa appear worrisome granted misdirected funds to forestall outcome problems or address existing ones. While Keivani (2010) notes that urbanization does not automatically guarantee sustainability, Madeleine (2016) cautions that only fortifying infrastructure and maintaining programs upon which strong communities build can guarantee urban poverty alleviation.

Social and spatial repercussions of rural-urban migration accentuate weak planning and governance systems of sub-Saharan African countries (Agergaard and Ortenbjerg 2017). The United Nations had estimated that developing countries would have more than half of their population live in the urban areas by 2017 (Sida Policy 2006). In the coming decades, Africa is expected to grow fastest (Parnell and Walawege 2011; Farrell 2018) as developing countries and Nigeria would record more than 90% of global population growth and 71.33% at the growth rate of 3.19%, respectively (Cobbinah et al. 2015). Nigeria's urban population growth has been rapid (Fox et al. 2018), and by 2025 it would increase by 57.9% at growth rate of 3.42 (Olalekan 2014), yet the country's population remains unplanned making poverty widespread (Adedokun 2016).

Ebonyi state is one of the poorest states in Nigeria. A report of the federal office of statistics showed that 52.6% of Ebonyians are poor. The demographic pull of Abakaliki urban and the high poverty growth rate in the state call for political commitment to appropriate targeting strategies in ensuring its sustainability. However, the government approach to empowerment scheme is inconsistent with conventional intervention targeting methodologies. For attainment of sustainable urban communities, direct involvement of beneficiaries is key (Pugalis et al. 2014). Improvement in efficiency and prioritization of projects requires community participation in identification, planning, and financing. More so, process and level of participation are critical for effective management and contribution to the need of the end users (Manzi et al. 2018). Therefore, misplacement/misalignment of skills and core of needy targets in the empowerment scheme identification, design, implementation, and evaluation poses great threat to the prospect of the global goals within the specified period – an indictment on government and decision-making structure. Emphasis on implementation need and its staggering effects on sustainability calls for governance driven by proactive action, competence, pragmatism, negotiation, and political will. While Turvey (2017) characterizes urban sustainability by liveable spaces, prosperous economies, secured environment, and empowered communities, Keivani (2010) stresses the direct relationship between governance/decision-making and sustainability.

Urban sustainable development problem arising from spatial poverty movement alerted urban development experts and scholars to understanding possible causes with a view to providing solutions. Previous studies, however, focused on factors such as demographic surge and intense competition for limited economic resources as urban poverty explanatory variables (see Anger 2010).

Evidence in Ebonyi state presents a contrary view and therefore challenges the conventional arguments: first, neither competition nor mobility explains urban poverty. Second, while urban poverty increases, rural poverty is also on the rise.

The inadequacy of conventional explanations for urban poverty in Ebonyi state is rooted in the negation of empowerment-benefit exchange (EBE) as analytical concept.

Today, the reality is that economy dominates both environment and society (Giddings et al. 2002). The virtual macroeconomic growth in Ebonyi state rather dominates attention of the government to the detriment of the microeconomic need. For environmental and social sustainability to become reality, both the macro- and microeconomies need great attention without compromising the other. The argument of this entry is that compromised empowerment methodology and diverted sustainable socioeconomic strategies pose urban sustainable development threat in the state. It also contends that the exclusion/inclusion errors associated with the scheme derail the harmonization strategies for sustainable development goals 1, "end poverty in all its forms everywhere"; 2, "end hunger, achieve food security and improved nutrition and promote sustainable agriculture"; 11, "make cities and human settlements inclusive, safe, resilient and sustainable"; and 17, "strengthen the means of implementation and revitalise the global partnership for sustainable development." Goals 1 and 2 have altogether dominated both academic and policy discourses more than any other globally, leveraging on goals 11 and 17. Goal 17 plays the enabler role (Tosun and Leininger 2017). The relationship between these goals significantly lies in the combined impact of the latter goals on the former.

However, there is no prior study on the role of EBE in urban and rural poverty reproduction and sustainability particularly, in Ebonyi state. Other explanatory concepts applied to Nigeria's context only explain surface reality, but cannot explain internal dynamics of financial transactions on budgeted empowerment funds between core of the needy and associates of government officials. Other than a complex EBE concept, corruption, poor funding, etc. attributed to poverty in many African literature do not help in understanding relationships between corruption practitioners, victims, intervention funds, poverty, social vices, and unsustainable development.

The challenge is that the entire process of empowerment is riddled with politics, while the real policy-target beneficiaries lack access, capacity, and training needed to succeed in the policy implementation process.

The goal of this entry is to apply empowerment-benefit exchange in understanding the socioeconomic distortions of government policy-making processes and practices in empowerment scheme in the context of sustainable urban development and anti-poverty drive.

## The Concept of Empowerment-Benefit Exchange (EBE) Explained

The EBE is a conceptual analysis of agency and process components of empowerment where manipulations and inclusion/exclusion errors take place during the implementation of empowerment benefits. Empowerment-benefit exchange is a structural constraint to the goal of empowerment initiative. As a socioeconomic concept, it explains the tiers of financial exchanges during implementation processes. It provides insights into some form of asymmetrical contractual arrangements that exist between associates of government officials (agency) and core of needy empowerment targets (target populations). Empowerment-benefit exchange occurs in two dimensions: commercialization and diversion. In both, there are loose boundaries – the target population defined by certain distinctive criteria is infiltrated. In the former, agent sells the benefits to a member of that population category either in cash or in other forms. Commercialization and re-commercialization of empowerment benefits are usually at very incremental exorbitant prices such that traded items/services reach expiration date or life span before repayment is completed, thereby leaving the latter worse off. In the latter dimension, the benefit or opportunity is sold to a nonmember buyer, denying a deserving member of the population category the benefit. One repercussion of this kind of empowerment implementation practice is the tendency of growing inequality. This outcome inequality is

antithetical to development (Freistein and Mahlert 2016) and empowerment theoretical postulations.

EBE explains this phenomenon and uncovers the concomitant effects of reproduction and sustainability of both urban and rural poverty in the state in spite of enormous expenditure on empowerment programs and Abakaliki aesthetic rebranding. According to EBE, the character of empowerment scheme takes the form of government-prebendal-target exchange process, which heightens survival pressure on the left extreme component (target) of the process, as well as the environment. The effects of this are rural-urban-rural poverty movement, closing of wealth distribution space, and consequential rise in vices. Urban-rural migration has resulted from narrowing of rural-urban gaps in accessibility of income and basic services (Tacoli 2008).

The empowerment-benefit exchange phenomenon in the employment sphere matures through sophistication of learning the art over time as institutional indifference builds up and the phenomenon becomes increasingly amoral. A major effect is the square peg in a round hole paradox, whose results are skill-role conflict, mediocre service delivery, and sustainability quagmire (Ukeje et al. 2020). Combined with the other factors, these create poverty retention and surge both in the urban and rural settlements. Nigerian governments have initiated several political and administrative reforms with a view to achieving some measure of development (Offu et al. 2018; Idike et al. 2019), but results have shown to be negative due to the existence of too many policies without political will for implementation (Ukeje et al. 2019a). Skewed allocation of intervention benefits has become an avenue to compensate and enrich political loyalists and acolytes to the disadvantage of intended target social strata (Ukeje et al. 2020). EBE can be applied in various sectors in Ebonyi state such as agriculture, transportation, environmental, etc. By its conceptual purpose, it can be applied in systems where diversion of empowerment benefits by agents (whether or not the sponsor is aware) exists. Pertaining to opportunities or other material offer such as grant, it provides insight into endless recycling of beneficiaries. In the absence of living claimants, however, fictitious names emerge and benefits claimed by proxies. Ironically, most times, these activities enjoy covert government sanctions, which is why complaints of short change are barely attended to.

Ukeje et al. (2020) observe two challenges faced by potential target beneficiaries: short change of the intended policy targets caused by psychosocial needs and pressures and limited knowledge base and insufficient resources to access empowerment opportunities whenever they become aware. EBE problem could be overcome if intervention implementation adopts practical processes. Education of citizens signals the beginning of result-oriented intervention projects/programs of governments. The benefits must become a legal document. Use of the right agents must be strictly adhered to. Application of effective accountability mechanisms, administrative procedures, data collection and reporting, and field monitoring must be emphasized. By contrast, absence of purposeful and goal-oriented organized sensitization mechanisms for vulnerable poor and illiterate populations limits their abilities and fundamental human rights. In the above circumstances, therefore, they are potential losers in the society's scheme of things, on one hand, because they lack basic information asset to effectively connect to intervention opportunities and, on the other hand, because they cannot express their frustrations loudest for redress. The effects are the direct relationships between poverty, unemployment, inequitable distribution of wealth, and social vices such as militancy, kidnapping, bombing, armed robbery, and destruction of government property, among others. Short change of the intended policy target, therefore, derives from the mix of psychosocial needs and kleptomaniac dispositions of policy-implementing agents. Ijewereme (2015) identifies correlation between corruption and societal pressure leading to greed and nepotism in Nigerian public service. This explains the nature of public service recruitment practices in Nigeria and other developing countries (Ukeje et al. 2019a).

In cases where there exist production and printing of guidelines, organization of training, radio communication, and face-to-face interaction

with eligible members, the actual selection stage is shrouded in the most secret arrangements and subject to unethical selection criteria in Nigeria, which inflict emotional disturbances. Consequently, intervention objective is unrealized. UNDP Report (1998) revealed that those who captured the benefits of the various poverty reduction strategies were not the Nigerian poor but the Nigerian rich and powerful (as cited in Onah 2010). Oxfam report on 17 May 2017 showed how the benefits of economic growth were captured by wealthy elite to the detriment of Nigerian poor (as cited in Baje 2018). Consequence of neglect of target populations during policy implementation is unarguably economic recession in Nigeria (Ajulor 2018) high poverty growth rates. The country witnessed poverty growth rate from 60% to 72% in 2016 (Ahiuma 2016; Eke 2016; Onwubiko 2017). One fundamental problem of Nigeria's development strategies points to scarce statistics to track performance, provide necessary information, and evaluate the policies. Ukeje et al. (2019b) assert that public service delivery in Nigeria has witnessed declining performance levels since colonial administrative period. However, strong political will and institutional efficiency could offer some relief.

## Sustainable Empowerment: An Alternative Instrument for Poverty Reduction

Empowerment has become a buzzword in the contemporary development discourse and represents the ideal form of intervention for sustainable development. Therefore, empowerment approach has become a common approach in recent times, especially in Nigeria; and this approach is one that is known to involving participatory strategies (Ozoya 2016). Broadly speaking, empowerment is often situated within two concepts – process and agency (Ozoya et al. 2017). It is the enabling of individuals through an autonomously inspired mobilization of untapped potential latent in the individuals. Anyway, there are definitional variations of empowerment; hence Mehra (1997) warns of need for measurement and quantification irrespective of context it is used. The challenge of measurement stems from existing contradicting general set of indicators, yet Santillan, Schuler, Anh, Minh, Trang, and Duc (2004) note that specific indicators can be developed in a given environment based on the purpose for which to use them or general "domains" or "dimensions" developed in one environment transferred to another.

Empowerment, therefore, is a transition from a relatively limited ability to an expanded individual's strategic life choice ability (Malhotra et al. 1995; Kabeer 2001). This ability is the required knowledge and tools for task actualization (Ozoya 2016). It represents a process that facilitates people to gain self-reliance and self-esteem, which allows for active popular participation in development decision-making. In its Human Development Report, the UNDP defines human development as "a process of enlarging people's choices. In principle, these choices can be infinite and change over time. But at all levels of development, the three essential ones are for people to lead a long and healthy life, to acquire knowledge and to have access to resources needed for a decent standard of living. If these essential choices are not available, many other opportunities remain inaccessible" (UNDP 1990, p. 10). To human paradigm, human development is composed of four main interdependent components, which include productivity, equity, sustainability, and empowerment. First, people must be rendered capable of raising their productivity level and be made to have full participation in the generation of income and paying job. Second, accessible equal opportunities must be guaranteed, removing all political and economic barriers to opportunities. Third, accessible opportunities for both the present and future generation must be guaranteed. Fourth, the people must not be denied of full participation in decisions and processes that affect them. In the words of Ranis et al. (2000), human development must be included from the beginning of any policy reform program.

From structural standpoint, Nye argues that development must have a combination of output increase and structural changes such as

decrease in poverty, inequality, unemployment, and increased access to basic social amenities (as cited in Atelhe and Agada 2014). According to Eme and Emeh (2012), these social conditions predominant in rural areas have generally dictated rural-focused development in Nigeria. For instance, Operation Feed the Nation (OFN), the National Accelerated Food Production Programmes (NAFPP), and the Directorate for Food, Roads, and Rural Infrastructure (DFRRI) were rural-based programs, yet could not address the social problems for which they were allegedly created. The reasons, according to them, stemmed from absence of basic infrastructures and social amenities that would attract rural dwellers and improve their lives.

However, based on the underwhelming impact of empowerment, Batliwala (2007) criticizes its approaches and practices. He observes distortion of the original ideas of empowerment and its lost transformative power. For Parpart, Rai, and Staudt, empowerment was considered a tool for the weak, best wielded through grassroots and participatory activities (as cited in Ozoya 2016).

## Participatory Intervention, Political Leadership, and Sustainable Urban Development Linkages

Intervention is "an intended, planned, and targeted operation in a system or process which aims at removing or preventing an undesirable phenomenon" (Loss 2008, para. 1). It is a people-oriented activity that requires an all-inclusive approach. It is considered a scheme for different elements and activities needed to realize intended result of a program. For Loss, multi-strategy interventions are considered the most effective in achieving desired and enduring change as there is potential to reach a larger number of people in a variety of ways. By influencing individual's knowledge, attitudes, skills, social status, creating supportive environments, policies, and resources, intervention can be described as a change agent, Loss concludes.

Interventionist strategy is a tool of government in enhancing the closing of inequality and empowerment gaps in society. Intervention has recently been assigned a plethora of designations and modes alternative to top-down, elitist, and centric character with the intention of popular and stakeholder ownership connotation. Top-down approach was one of the major drawbacks of earliest development efforts in most developing countries (Ezeani 2012, p. 59; Reddy 2016; Biermann et al. 2017). Participatory development has become a growing concept in development lexicon, concept inspired by the work of Robert Chambers as alternative to top-down development mode. It is committed to inclusion, access enhancement, and direct involvement of people in development activities and processes (Oakley and Clegg 1999).

One interventionist approach is targeting strategy. The identified gaps are closed by targeting mechanism, which is inherently restrictive. Every policy has targeting undercurrent (Meessen and Criel 2008). For instance, economic and education policies target the poor and the illiterate, respectively. It is focused-group policy that delineates population needs. By means of indirect indicators, targeting is the only viable alternative for most developing nations due to the absence of reliable information for identifying the poor and mounting constraints on limited public resources (Obi 2005). Furthermore, relevance on the most suitable *verified means test* has been overshadowed by a commonly applied indicator targeting comprising a broad range of alternative methodologies (such as age, acreage, asset holdings, education, employment, gender, and place of residence) for lack of reliable information on incomes (Krishna 2007). For attainment of its conceptual objective, targeting should focus majorly on what to target, not whom to target (Krishna 2007). Nevertheless, the author identifies administrative cost, political viability, among others, as obstacles to use of the targeting indicators and focus. Obi (2005) notes that policymakers are challenged by using available resources to provide the greatest possible assistance to people who need it most. However, targeting is a necessary means of empowerment with many benefits. It enhances efficient management of limited resources arising from its

goal-oriented character leading to access restriction to the nontarget group. It is couched in efficiency and effectiveness.

Given the complex nature of intervention, the political leadership is empowered to set goals and devise strategies for realizing them through influence and allocation of resources (Kristof et al. 2008). By the nature of political leadership, the government reaches the people through the organized agencies. According to Tucker, the leadership is by obligation required to accomplish the tasks for meeting needs and demands through mobilization of persons involved (as cited in Kristof et al. 2008). The emergent focus on governance in ensuring efficient management of resources for public good has been shaping leaders. Thus, involvement of empowered stakeholders and issue-focused approach is rapidly substituting for representative participation (Kristof et al.). Participatory development and the state-residents partnership have been very crucial in problem/need identification and ensuring enduring solution (Manzi et al. 2018). The need for improved accountability to the rural poor resulted in development approaches that require community involvement rather than a selected few in the problem identification and solution process (Lunt et al. 2018). For sustainable development to occur, there must exist the practice of governance values of collective action; trade-offs based on equity, justice, and fairness; and accountability mechanisms for reaching targets and outcomes (Bowen et al. 2017). Duit and Galaz (2008) observe that there is a move toward a number of different schemes of self-government, public-private partnerships, collaboration, policy entrepreneurship, and participatory processes that come under the umbrella term of governance.

Hence, (Pugalis et al. 2014) stress that participation is key element in the maintenance and sustainability of urban change. Urban areas, depending on status level, are becoming increasingly more cosmopolitan. The appearance of economic prosperity of the urban center portrays it as a center of attraction. Urban economy generates much of the government revenues for its development activities and legitimate existence. The migrants have diverse backgrounds that influence their orientations and attitudes to their newly found environment. These rural migrant families are relatively poor, seeking a better life with a high expectation from the new environment. The level of behavioral compliance largely depends on the relative benignancy of the urban residence. Perceived or actual conflict between means and goals makes social deviance inevitable. The effects are that the deprived individual member of the urban settlement resorts to looting, vandalism, abduction, rape, terrorism, and other forms of economic sabotage.

All of this threatens sustainable urban development. To forestall occurrence of these and guarantee sustainability, the political commitment to all-inclusive urban development planning that will meet the social, economic, and psychological needs of majority of vulnerable members of the community should take a center stage. The poor can only benefit from strategic planning and management when there is the likelihood of participation in priority definition and decision-making (Allen 2003). For a better environmental justice, the traditional top-down approach has been increasingly displaced by a bottom-up, experimental, and multi-actor approach to development of urban citizen society (Assmuth et al. 2017). The concept of localism has gained quite a dazzling currency and reputation in development. Not even Mohan and Stokke (2000) who expressed doubt about its benignancy in participatory development and empowerment ruled out the correlation. The government would, after understanding the local community development idea, amend and build upon it. To reduce the tendency for disaffection among the local population in case there are identified flaws in the idea, wide sensitization coverage will suffice. Confidence level must be boosted through active participation of the people.

Social empowerment is both a means and an end to the SDGs. As coherent policy guide (Tosun and Leininger 2017), SDGs advocate a leave no one behind thinking and practices (Kite et al. 2014; Fitzpatrick and Engels 2016; Stuart and Woodroffe 2016; Dawson 2018). It is a policy framework for national-level priorities in providing decent and sustainable empowerment

structures for citizens' material and psychological satisfaction. The new goals also benefit from the vast enabling human capacity, without which they are consigned to mere aspirations. Mathur (1999) notes the correlation of human capital and development in which the latter is stimulated by the former directly or indirectly. For strategic direction, the articulation and design of policy goals is critical to attainment; but more critical is the implementation.

The widespread rural and urban poverty and the sustainable urban development implication in Nigeria entail political will to evolve policy design with a high implementation prospect. Fischer-Smith (2018) contends that policy implementation loses its effectiveness when those charged with the responsibility of implementation act in the manner opposed to the policy-makers' specified intentions, which often includes divergence between the policy design and implementation processes. Furthermore, Pierre and Peters maintain that scholars' assessment of effective policy implementation relates to the final effects and related programs on the society (as cited in as cited in Olsen et al. (2014)). Zaehlke et al. consider the degree to which a policy is successful in solving whatever problem it was intended to address as a baseline for effective policy implementation (as cited in Olsen et al. 2014).

## Harmonizing Development Planning and Empowerment Strategies Toward Sustainable Abakaliki Urban Community

Planning is key policy response to sustainable urban development challenge. Belsky highlights better planning practices for urban development and poverty alleviation (https://www.huduser.gov/portal/pdredge/pdr_edge_hudpartrpt_032213.html). Urban communities must guarantee healthy living environment if sustainability is to be achieved. However, healthy city living depends upon well-planned cities, especially, in the twenty-first century (Giles-Corti et al. 2016). The dynamic interaction between decisions and city health is such that the well-being, safety, and aging urban populations are directly affected by decisions about transportation, health care, water, social services, food, energy, and housing. Understanding migration rate resulting in urban policy projections can engender sustainable conducive urban formation (Danilina and Chebotarev 2017; Turok 2017). The projected population growth in Abakaliki by 2020 is a clarion call to policy-makers to be actively engaged in finding realistic solutions to infectious disease outbreaks through improvements in sanitation, housing, and separation of residential areas from industrial pollution and flood-prone settlements. It is expected that sound planning and decisions will profoundly contribute to mitigation of the effects of annual Lassa fever, climate change, noise pollution, and reduction in noncommunicable diseases in Abakaliki urban in particular and the state in general.

Specific to Nigeria, a settlement above a population threshold of 20,000 inhabitants can be classified as urban. In light of this, Abakaliki acquired urban status prior to its designation as Ebonyi state capital in 1996 at least by population qualification but still unable to find solutions to its sustainable development problems. Abakaliki recorded a population growth of 78,911 from 1996 to 141,438 in 2006 and projected to rise to 777,252 by 2020, according to the National Population Commission (as cited in Anyigor 2012). This rapid increase is worrisome given insignificant improvements in tackling accompanying sustainable issues. Now, according to the National Population Commission and National Bureau of Statistics, Abakaliki is a home to 2,176,947 million people (as cited in Nwofe 2015). The growth has necessitated increased economic activities, rapid markets formations, and unplanned and haphazard structures in some settlements around the Abakaliki city without being effectively regulated both formally and informally.

However, government has responded through institutional mechanisms. Development institutions have undergone nominal changes without fundamental improvements. In the year 2007, government established ACTDB by the EBSN Law No. 5 of 2007, which was amended to Abakaliki Capital Territory Development Board

and Related Matter Law No. 10 of 2015. Its subsidiary bodies such as EB-SEPA created in 1996 lack adequate modern facilities and workforce (Nwofe 2015) corresponding to the current population growth, a condition capable of limiting possibility of attaining SDG 11 by 2030. Similarly, the institution of ACTDB has underperformed in its mandate to carry out proper town planning in Abakaliki metropolis (Nwofe 2015). Lawanson (2005) establishes linkages between sustainable urbanization and unhostile environment. The author submits that checked urban poor will lead to decline in environmental degradation and further sustainable urbanization.

With a view to tackling poverty and socioeconomic development issues, Ebonyi state government collaborated with the United Nations Development Programmes (UNDP) to undertake the UNDP micro-credit scheme in the late 1990s (Udu and Onwe 2016). As time progressed, following the termination of the UNDP program, the Ebonyi State Community-Based Poverty Reduction Agency (EB-CPRA) came into being in 2005 with the same objective of addressing poverty problems in the state. NAPEP was aimed at tackling poverty as quick as possible (Kanayo 2014), but poverty alleviation programs in Ebonyi state under the agency failed for not being participatory, demand-driven, or people-oriented. EB-CPRA micro-projects voided target beneficiaries' involvement, which ought to have been the guiding principle of the agency. Afterward, to assume a social development responsibility, too, there was a merger of Community-Based Poverty Reduction Project (CPRP) and the Local Empowerment and Environmental Management Project (LEEMP) in 2007 (Udu and Onwe 2016). From the mandate argument, EB-CSDA has not fared well in its responsibilities. From the author's analysis, evidence in the socioeconomic, environmental, transportation, and infrastructural indicators confirms failure of the agency within the remit of its jurisdiction.

Persistent poverty growth rate in the state has necessitated two outstanding empowerment strategies by the state government: keke empowerment and agric revolution. Keke mode of transportation in Nigeria is recent relative to agric channel to socioeconomic development. In recent times, government of Ebonyi state embarked on face-lifting of the state to upgrade Abakaliki urban status. Among projects embarked on included 700-m twin Trans-Sahara bridge linking Enugu and Ebonyi States with Cameroon; the Senator Offia Nwali flyover; the 14.5 km Abakaliki-Afikpo road; laying of foundation of the Ebonyi city mall; and foundation laying of the Muhammadu Buhari bridge and the Akanu Ibiam statue.

Besides physical infrastructural development in Abakaliki metropolis, the government of Ebonyi state has in succession released a number of empowerment programs since inception. The government embarked on a campaign strategy developed to tackle poverty and unemployment and to ensure citizens' access to quality and better healthy living. In February 2017, the state government kicked off N2 billion agricultural empowerment program for 8,000 civil and public servants in the state (Akpa, *The Guardian* 2017). The government, on 30 October 2017, said that 7,000 indigenes had benefited from the state's microeconomic empowerment programs. According to the government, target beneficiaries of the poverty alleviation program were made up of 4,000 widows and 3,000 women and youths drawn from the 13 local government areas of the state. The government claimed, in providing economic safety nets to poor, unemployed widows, women, and youths, N400 million was disbursed to widows, while 3,000 women and youths received N250,000 each. Furthermore, the government said it empowered over 4,000 youths with N250,000 each as grants, especially those who were hawkers in Lagos (Edward Nnachi, *Daily Times* 2018).

The government equally stated that over 4,500 widows were empowered with N100,000 each to assist them start up various businesses. On 12 April 2018, the state government stated its decision to empower 13,000 indigenes with N2.6 billion (NAN, *Agency Report* 2018). The government said the beneficiaries would receive N200,000 each to start up businesses of their choice. It promised that the amount could be

increased to N400,000 with the support of the Bank of Industries (BOI). The government charged the stakeholders on compilation of names of beneficiaries from various communities and organization of training programs for effective utilization of the funds. Emphasis was on women, youth, and the vulnerable.

One problem of government approach to urban and poverty issues in the state was the naively financial inducement to Ebonyians resident in other states of the federation to return to the state. The sustainability flaws of this strategy stem from the negation of natural process of mobility which makes short stay of beneficiaries predictably inevitable. Also inferred from this, meagerness of the grants relative to high cost of living in the state renders the policy goal unattainable and unsustainable with severe implications for poverty reduction drive in the state and sustainable Abakaliki urban. Frequent mobility of residence complicate poverty targeting upon which many cash transfer depends, and this has serious implication for the urban sustainability.

Situating the above development-intervention methodology within government policy response, there is a sharp contrast with Turvey's description of urban sustainability which includes secured environment and empowered communities (Turvey 2017). The exclusion/inclusion errors which characterized the process of implementing the above-stated empowerment opportunities render Abakaliki urban sustainability unattainable. The implication of this contrast is poverty rise. According to Winsemius, Jongman, Veldkamp, Hallegatte, Bangalore, and Ward (2018), people living in poverty are particularly vulnerable to shocks, floods, and droughts. The poor can barely comply with regulations, a challenge to urban sustainability. However, many settlements within Abakaliki urban center such as Kpirikpiri (Pugalis et al. 2014), Udemezua Street, and Azu Ugwu are still slums and under constant environment-induced threats of floods, diseases, and other natural disasters. This is an interrogation of the state government and development institutions' approach to anti-poverty drive and sustainable urban development in the state.

Prevalence of social dislocations, insecurity, epidemic outbreaks, and Lassa fever, just to mention a few, is an indication of Nigeria's unsustainable development in general (Ighodalo 2018) and Abakaliki in particular. Perennial cases of Lassa fever and flooding have topped disaster discourse in the state. The disease appears intractable since it first occurred in 2005 with deaths record of five persons. It struck again in 2008, 2014, and 2015. Most recently, in January 2018, Lassa fever outbreak killed patients, nurses, and medical doctors at the Federal Teaching Hospital Abakaliki (FETHA) resulting in 1-week closure of both private and public schools in the state. Flooding is rather an annual disaster in the state. In June 2017 alone, more than 200 houses were destroyed by flood. Farmlands and crops worth millions of naira in eight local government areas were equally destroyed. All of this is an indictment on the government's sustainable urban development planning strategy in the state.

## Ebonyi Empowerment Benefits Implementation Processes

The imperative of appropriate empowerment strategies for sustainable urban development has caught the attention of the state government. But, the strategy characterized by reckless cash transfers rather peaked the empowerment streak. According to Satterthwaite (2003), sometimes government processes can be incompatible with the effective realization of poverty reduction. Efforts toward reducing poverty may have to require empowering people to develop resilience, as well as overcome it within the bounds of their capabilities and resources (Danaan 2018).

### Lessons Learnt: Empowerment-Benefit Exchange in the Ebonyi Urban Transport System

The fast-urbanizing Abakaliki metropolis has been accompanied by structural changes, including the road transportation system. In the transformation mantra of the government, no fewer than 39 urban roads within the Abakaliki, the state capital, have been completed. The formerly

reputed and addressed as a glorified village due to its dusty and dirty environment has become transformed city in terms of tarred road network, fly-over construction, street light, just to mention a few. The changes (including modes of transportation) are inevitable. According to Ehebrecht, Heinrichs, and Lenz (2018), diversifying urban and rural populations' mobility needs is a result of urbanization, population growth, and social change. However, a body of international literature on transport justice is fast growing (Jennings 2015). In view of this, it will be considered imperative that tricycle (popularly referred to as keke) received policy attention of the government as a means of target youth empowerment to reduce urban poverty in the state capital. With the objective of addressing poverty issues, on 29 March 2018, like the previous administration, the government distributed 100 cars and 400 keke Marwa to some traditional rulers and other residents of the state, respectively. This mode of transport provides a wider spatial coverage by availing a segment of low-income users of services not usually provided by other alternatives like bus rapid transit (BRT). Thus, it is a reliable response to the equity service limitations of BRT. Venter, Jennings, Hidalgo, and Pineda (2017) observe that benefits of BRT are often skewed toward medium-income users, insufficient spatial coverage, and inappropriate fare policies. Keke is effective both in cargo and passenger transit in a very short distance unlike conventional mode of road transportation that can conveniently undertake interstate long distance. As policy response to equity problem of BRT, keke-transport mode would alternatively provide transport services to the vast rickety poor settlements on the outskirts of urban centers where motorized transport services are scarcely accessible and affordable.

Nevertheless, the justice problem and urban poverty do not seem resolvable by a mere availability of keke transport system in the state granted that the core of the needy and dedicated-passionate individuals whose services would rather reach the hinterlands was denied the empowerment benefits. A number of issues need clarifications in order to understand the above contradictions. How it was acquired is a source of concern: What category of the poor acquired it? At what cost was it acquired? Under what conditions was it acquired? What are the poverty and urban sustainable implications? Findings reveal that it was not the core of the deserving poor accessed it; and the second tier beneficiaries (see section "The Concept of Empowerment-Benefit Exchange (EBE) Explained") acquired it at very incremental exorbitant costs. There is a compelling methodological interrogation of the target-poor youth intervention program. The intervention's implementation was complicated by lack of known targeting strategies. There is clear evidence, from widespread exclusion/inclusion errors, that neither *a verified means test* was used nor were indicators like age, acreage, asset holdings, education, employment, gender, and place of residence but political affiliation considerations applied.

So worrisome and complicated is the outcome tendency of severe pressure on the commercial keke operator who happens to be a victim of EBE to remit returns which often limits daily income or leaves him in severe deficits. There is the challenge of even current poor to escape out of poverty let alone the prospect of forestalling potential poor. This is because corrupt associates of government officials who undeservedly benefited from the scheme traded it on a hire-purchase arrangement to the operators. In another instance, it was outright sale on the condition of gradual payment that might never be accomplished at foreseeable profitable time. In an expanded exchange process, the second-tier beneficiary buys it from the first-tier beneficiary and resells it to the third. This process of commercialization and re-commercialization of empowerment benefits is what we refer to as "empowerment-benefit exchange process." The government empowerment program is descriptively counterproductive, and its implementation process engenders unintended poverty reproduction and sustainability. The poor is made worse off by the system of unjust exploitation. The need to be potentially better off prompts selling of personal assets like land or use it as collateral for loan worth of the cost of the empowerment keke. Thus,

property rights and household economies/income do not automatically exhibit linear relationship (Muyeba 2018). Some of the first-tier beneficiaries are yet to put it into productive use. The keke is abandoned to ruin, sometimes borne out of unsatisfactory exchange offer. Unfortunately, government statistics on empowerment and poverty reduction are not reconcilable with actual data on poverty profile in the state leading to improper impact assessment outcomes.

From the exchange process problem, the so-called beneficiaries would likely restrict their services to the urban residents with resultant diminishing revenues in the context of intense competition for contracting market share leading to urban poverty sustainability. Its use is tailored more toward epicurean pleasures than economic prosperity, hence concentration in the cities. Businesses can only operate sustainably when driven by economic need (Fleming et al. 2017). Another negative effect is the costly drifting away of urban settlements from needed rural services, thereby increasing the mileage and time food is transported (including perishable food) by means of prevalent non-motorized mobility. Globally, rural areas' dependability for food production is unlikely to end. Specifically, development efforts in agriculture and the rural areas have potential to unleash positive development dividends for Nigeria. A worthwhile community development depends on improved rural poverty condition. There will be sustainable food security only when all people can access enough food for an active healthy life at present, as well as the ability to provide enough for future generations (Metu et al. 2016). This makes it imperative to heed a call for integration of urban food security issues in the development of city master plan (see Agergaard and Ortenbjerg 2017).

Thus, transportation policies and programs must integrate the mass public, as well as be driven by poverty need (Booth and Richardson 2001). Though relatively new, keke has been a mode of transportation in the state; government massive investment in it and distribution to the people of Ebonyi state was meant to tackle poverty, and its concomitant vices yet fell short of direct involvement of the core of the needy. Therefore, the keke scheme was aimed at empowering the poor who were considered a source of the rudimentary social vices and urban disturbances. The commercial activities of keke operators have rather witnessed little spatial expansion into the rural communities to decongest the city of Abakaliki. As tranches of keke were released and distributed with the exchange character, redundancy problem sets in with the resultant tighter competition for market share among operators. The effect is an increasing shortfall in revenues. Temporary urban-rural migration becomes, for some, a short-term alternative choice, and poverty issues in real terms are still unaddressed. Another possible cause of a temporary urban-rural migration option is the high legal and illegal multiple charges by government officials and unions, evoking a sense of rural areas presented as inevitable alternative settlements for some keke commercial operators. For the exchange problem, whatever the revenues are, they are reserved for payment for the keke bought on a hire-purchase basis or to be used to liquidate loans from which the keke was purchased at very high costs. The long-term effect is widening rich-poor gap.

The implementation methodology has also compromised needed training of the "target beneficiaries." The neglect of training and sensitization programs in the operation of motorized keke transportation poses a great danger. This attitude is prevalent in Nigeria in spite of frequently occurring road traffic accidents (RTAs). Ezeibe et al. (2018) observe that road users neglect traffic signs as critical road infrastructure guiding them.

## Lessons Learnt: Empowerment-Benefit Exchange in the Ebonyi Agriculture Sector

Agricultural investment is hinged on promoting sustainable growth, development, and poverty reduction. Agriculture is the main occupation of Ebonyians, yet Ebonyi is so poor a state. The people of Ebonyi produce crops such as rice, cassava, yam, plantain, maize, banana, cocoyam, etc. The state has fertilizer blending plant in Onuebonyi in Izzi LGA, which is a huge relief for arable farmers in the state. There have been several incentives given by the state government to invest into the agro-allied sector (Nwobodo

et al. 2015). In recent times, the government said it had contributed its 50% equity contribution for 6,000 farmers in the IFAD N4billion empowerment scheme (http://www.greenbreporters.com/business/griculture/ebonyi-governor-moves-engage-50000-farmers-8000-civil-servants-grow-agric.html). It equally stated that more than 15,000 farmers benefited from the state's direct funding.

The state government encouraged establishment of cooperative societies for cassava and rice production only. The agricultural empowerment scheme targets two categories of people through cooperative societies: civil servant farmers' cooperative societies and cooperative societies for people who are not in the civil/public service. Registered cooperative societies are the platforms upon which the agric loans can be accessed. A cooperative society may focus on cassava production or rice production. Having been registered and certified, a member of a cooperative society will be required to acquire and declare two hectares of land for verification before accessing the state government loan worth of N600,000. This amount was considered good enough to cover the expenses for 2 ha of land. Afterward, the amount was halved, but the 2-ha specification was unaltered. The loan is mandatorily repayable within 12 months of receipt. An estimated worth of nonfinancial component of the empowerment (such as fertilizer, seedlings, chemicals, etc.) will be deducted from the cash loan of N300,000. These are the issues a beneficiary will have to deal with.

The government water projects in the state are welcome incentives to continual agricultural production. The overall benefit is its potential to undermine seasonal agricultural production. In 2017, the government embarked on water projects in Oferekpe, Ezillo, and Ukawu within the capital city and Uburu, Izicha Forest, Sakamori line, Ugwulangwu, Ishinkwo-Ukawu, and Juju Hill intended to be completed by first quarter of 2018. The government stated that it purchased three modern rice mills, installed parboiling units of machines in the rice mills at Ikwo, Izzi, and Oso Edda, advanced rice production to over 65,000 ha in the state, purchased four cassava processing machines, offered loans of over N2.5 billion to farmers, expanded fertilizer plant by building two new warehouses and purchased a brand new fertilizer plant, launched a program dubbed "one-man one-hectare," and purchased and distributed no fewer than 50 tractors to help farmers.

Going by the above positive gradient for, and dazzling description of, agriculture sector in the state, Ebonyians can feed reasonable proportions of the Nigeria's population in foreseeable years. But, certain prevailing practices render the potential to unleash economic prosperity unattainable by reason of the diversion and derailment of "the good intentions" of the government for the genuine farmers by the powerful group of "briefcase farmers." This group is composed of nonfarm politicians garbed in the farmers' appearance whose concealed objective is to divert empowerment benefits to themselves, cronies, and relatives. For example, distribution of farm inputs such as treated rice seeds, cassava stems, fertilizers, insecticides, seedlings, and agrochemicals was under the tight grip of benefit exchange phenomenon. Below are the reports of one of our interviewees (paraphrased but figures unchanged). In 2017, in one of the sessions of farmers' cooperative societies in Abakaliki, accessibility and receipt of fertilizers and chemicals were shrouded in exchange conditions. Two conditions were open to supposed beneficiaries: payment of N40,000 by the intended beneficiaries in exchange for the items or accepting N5,000 from donors' state representatives to forgo the items in the event of inability to afford the charge of N40,000. However, the share of those who could not afford it was sold to dealers in the items who in turn put them on their shelves to be sold at higher prices than N40,000. More so, anyone who could neither afford it nor accept the exchange offer of N5,000 had their names column signed by someone else, implying the items had been received by the intended target beneficiaries.

The psychological makeup – feeling of powerlessness and insignificance – of the poor limits their confidence to participate in engagements (Khan and Cheri 2016). Since the poor and illiterate lack connections and means of communicating their frustrations to appropriate

authorities with a view to seeking redress, poverty sustains and reproduces itself. There is also the tendency of growing inequality.

### Lessons from Previous Policy-Making Approache(s) by the State Government

The state government policy-making approach for poverty reduction lacks sustainability and impact due to the influence of EBE, hence, continued policy failure. The past empowerment scheme of the Ebonyi state government did not apply the six-step requirements of intervention targeting (participatory intervention): the formulation of the intervention; the definition of the intended group of benefits; informing the stakeholders (including the target group); the identification of individuals meeting the eligibility criteria; the entitlements; and the utilization of the program benefits. It was not guided by known targeting methodologies. All of this accounts for the unintended outcomes.

Our findings support the Booth and Richardson (2001) work entitled "Placing the public in integrated transport planning" in which they identified top-down approach possibly dictated by political considerations in transportation system in Britain. The nonperformance of keke transport mode in engendering controlled-urban poverty in the state has created a miasma of disaffection among the public resulting from politically linked inclusion/exclusion errors in the implementation of the empowerment interventions.

That the intervention aimed at addressing the issues of rising poverty, crimes and insecurity, and there is established heavily funded paramilitary unit (such as Neighbourhood Watch) suggests that the empowerment programme failed in that regard. This has serious implications for Abakaliki urban development sustainability and by extension for sustainable development goals expected to be attained by 2030.

As political patronage, the empowerment benefits were diverted. Almost all commercial operators of the government-owned keke in the state fall into the second-tier beneficiaries' category (see section "The Concept of Empowerment-Benefit Exchange (EBE) Explained"). In order to become legitimate owners, they entered a contractual agreement to remit, in addition to the initial total cost (including the cost of registration and miscellaneous expenses) between 43% and 100% of the pre-agreement costs. Payment was either by installment or on-spot payment. The empowerment schemes were devoid of ethical selection processes that would instead focus on the core of the needy both in the urban centers and rural settlements, the latter possibly leading to controlled spate of rural-urban migration and Abakaliki urban sustainability. The unintended results put pressure on institutions of ACTDB and EB-CPRA with little or no impact.

From empirical investigation, there has been increase in production at the Abakaliki rice mill following renewed interest in agriculture. From an interview with secretary of RMOIA of Abakaliki, Ebonyi state, majority of supplies come from outside the state. According to FAO, the middle belt is the highest producer of rice and enjoys comparative advantage in production over other parts of Nigeria (as cited in Ugalahi et al. 2016). The renewed mass interest came on the heels of inflation, hardship, hunger, etc. created by imports ban policy of the federal government and the economic recession that accompanied it. Particularly, rice import restriction policy had its toll on the importers. By contrast, it boosted local rice production in Nigeria in general and Ebonyi state in particular. By reducing the purchasing power and available resources, constant rising food prices and increasing poverty constitute a threat to household food security (Hendriks 2005) in the state. It was around early 2016 that nonfarm indigenes started to engage in agriculture and small-scale farmers expanded their farmlands to be able to produce more for their consumption, at least. In Amangwu Edda in particular, the community law restricting strayed goats provided motivation to even use surroundings for crop cultivation. By then goats owners had started tethering their goats. By logic of sequence, Ebonyi state intervention program in agriculture was preceded by federal government empowerment programs vis-à-vis recession and inflation. There is no evidence suggesting that increase in production of rice, cassava, etc. in the state owe its origin in the state government programs. Federal government empowerment programs such as anchors borrower may have played significant role in that

regard by reason of precedence. Federal government ban on rice imports occurred in 2016. The government of Ebonyi state interventions in agriculture started in 2017. What the state government program would do was to consolidate the impacts of the federal government efforts by implementing its own with emphasis on age, acreage, asset holdings, education, employment, gender, and place of residence as targeting indicators, as well as limit the dominance of political considerations. The intervention would have been impactful had the beneficiaries been composed of people whose preoccupation is agriculture other than the state civil servants who were coerced into farming with the threats of employment termination and deprivation of statutory entitlements.

More so, the production increase still does not suggest direct relationship with food security and poverty reduction. Agricultural intensification or food security issues can be achieved only with specific recourse to equitable distribution and individual empowerment other than focus on production only (Loos et al. 2014). From interview and focused group discussion (FGD) findings, beneficiaries of agricultural benefits were predominantly the people with no interest in agriculture. The genuine poor farmers of relatively small-scale production with passion and significant years of experience were undeservedly excluded from the empowerment opportunities. Most beneficiaries sold the inputs such as fertilizers and chemicals. Some declared virtual farmlands to claim benefits from the government. There is no evidence the government devised mechanisms to prevent (or reduce) the tendency of diversion.

The design and implementation failed to create alignment between agriculture and urban transportation. The implication of this is derailed interface between Abakaliki urban economy and rural agriculture. The wide-ranging benefits flows from proper alignment of road network and agricultural prosperity are rather lost in the skewed implementation of the empowerment benefits.

## Conclusion

Public policy is a desideratum for development, which governments must undertake. However, sound and effective policy-making for sustainability outcome should be based on certain governance principles. Important policy outcomes are empowerment and poverty reduction, key strategies for sustainable urban development. Empowerment of citizens closes inequality gap through the outcome of people/citizens' involvement in the project community and decision-making process. The people's active participation can further lead to capacity building and policy sustainability. Important elements that characterize policy-making and implementation in Nigeria governance have been explained using the EBE conceptual framework.

From our findings, the benefits/opportunities were hijacked by the agents. This is consistent with Berkhout et al. (2018) generic submission that elite groups divert more public resources for their own benefit when given a chance. Also, finding is consistent with the finding of (Masters et al. 2018) that even if economic development proceeds rapidly in urban Africa, rural Africans will face continued impoverishment unless government interventions change to improve the lives of people working in agriculture at a low productivity levels. The outcome of failed conceptual promise of empowerment is rooted in the implementation process.

Sustainable urban development cannot be achieved without guaranteed security and empowerment of the rural communities through their active involvement in all stages of policy process since majority of the people live in the rural areas. The exclusion they suffer leads to finding their way into the cities. Prominent in the implementation of the empowerment scheme in Ebonyi state was the problem of double asymmetry of information. This could have been overcome through the application of good accountability mechanisms, administrative procedures, data collection and reporting, and field monitoring.

# Policy-Visibility and Implementation in Public Administration

Gedion Onyango
Department of Political Science and Public Administration, University of Nairobi, Nairobi, Kenya

## Synonyms

Policy advocacy; Policy capacity; Policy knowledge; Policy learning; Stakeholder consultations

## Definition

*Policy-visibility* is an approach to policy implementation analysis that broadly describes activities, strategies, and processes involved in enhancing the exposure or increasing the prominence of public policy designs and contents to the general populace and concerned parties (i.e., going beyond policy announcements and moving the policy from the boardrooms to the public).

## Introduction

Why do some policies seem to be more impactful or "known" than others, or why are public and political administrators more receptive to some policies or policy contents than others? And why is it that some public policies of similar policy types attract more funding or are more implementable than others within likewise similar environments of public administration? Much as answers to these questions often largely reside in extensive policy studies that over the years have generated rich data, they have been mostly handled within the variations of power relations and tensions, policy typology, the tendentiousness of the policy objectives, the complexity of joint actions, policy learning trajectories, institutional and resource capacity deficiencies, evidence orientations of policy designs and problems, the presence or absence of mutual adaptations, policy sedimentation and dynamics of policy evolution, and the participatory dimensions of implementation processes, namely, bottom-up or top-down approaches (Kingdon and Thurber 1984; Wu et al. 2015; Onyango 2019).

Yet, together these factors are indicative of the sophisticated correlative relationships between public policy and implementation or what has been coined as the word/needs dichotomy by implementation students and organizational hypocrisy by students of administrative reforms. Thus, it is hardly certain whether a policy design will subsequently direct its implementation in the first place (Pressman and Wildavsky 1973). In short, what is *visible* can be contestable about the policy and may lead to visibility inconsistencies of policy contents, their interpretations

and transfer or dissemination. To address this, therefore, a collective memory or understanding of the policy is critical for effective implementation processes in public administration. And this would be most likely tied to the degree of knowledge, awareness and communication, etc. about the policy design and contents by public and political administrators, concerned stakeholders, and the public. Yet, much as there are a number of viable policy formulation and implementation frameworks and despite indirect efforts by governments to improve the prominence of public policies, a little has been done. First, little attention is often paid to the variable of visibility so as to underscore critical policy objectives and integrate problematic interests and, second, there are unsubstantial efforts to conceptualize policy-visibility and device strategies that governments and policy-makers can pursue to improve policy-visibility in public administration and management. In this chapter therefore some answers to questions posed above also considerably reside, though in part, and are analogous to the degree of policy-visibility.

However, the term visibility in this context may take on different viewpoints. For instance, it may include the extent to which policy-makers discern the problem structure of the policy, i.e., how well has the policy problem been constructed and "visible" in terms of its contents? Visibility may also denote to the extent to which political actors and other stakeholders conceptualize a policy problem and objectives and hence considers the extent to which their interests are visibly presented. Moreover, visibility can relate to how public administrators interpret and internalize policy contents that subsequently fosters institutionalization of the policy design. Finally, visibility enlists the degree of the citizenry's knowledge of the policy objectives and related administrative burdens that may accompany public policy. This would influence the citizens' capacity to provide relevant policy feedbacks that can be utilized to improve policy contents. Even so, visibility may largely also depend on who are targeted and what policy issues are prioritized. Therefore, visibility can be contained within or can be accessible to particular interested parties more than others much as it is ideal for the general populace to be knowledgeable of policy contents and objectives. So, the utility of policy-visibility as an umbrella term can explicate policy dynamics in the contexts of policy implementation in public administration.

Besides, with growing efforts to narrow the gap between research and policy, a focus on the composites of policy-visibility can assist by identifying less burdensome or viable strategies of getting research into policy and practice (GRIPP) and getting practice into research at different levels of policy implementation. In other words, the utility of policy-visibility as an approach to policy implementation analysis can allow researchers to establish synergies that characterize implementation deficits, mainly, those related to policy communication (dissemination, interpretations, etc.); deficiencies, dynamics, and pitfalls in policy transfer (institutionalization, coordination, etc.); and translation (internalization and learning) in public administration. That is, implementation deficits may also largely lend to problematics of visibility of policy contents. As such, policy-visibility – as influenced by policy advocacy, resource mobilization, organizational visibility, policy training, the rank and profile of actors, etc. – is central in discerning policy implementation environments in public administration.

## Policy-Visibility (*and Policy Blindness*) as an Approach

*Policy-visibility* is an approach to policy implementation analysis that broadly describes activities, strategies, and processes involved in enhancing the exposure or prominence of public policy design and contents to the general populace and concerned parties. In short, it refers to the extent to which concerned stakeholders, street-levels personnel and targeted population construct and internalize policy problem and objectives. Policy-visibility activities and strategies integrate the degree of policy entrepreneurship, policy communication, knowledge exchange, stakeholder consultations, etc. Policy-visibility, therefore, can also consider the rank and profile of public entrepreneurs involved, media framing, organizational visibility,

and levels of institutionalization and internalization of the policy design and objectives inside and outside public administration. Some of the strategies for enhancing *policy-visibility* often enlist utilization of public relations strategies with regard to communication of the policy problem, contents, and objectives. This could mean that policy-visibility strategies can assist with breaking institutional *silos* that characterize most policy errors, accidents, and anomalies, and which could also specifically emanate from uninformed cognitive responses due to the lack of adequate exposures or promotion of policy contents and objectives.

Such being the case, policy-visibility approach underscores processes of knowledge exchange and utilization, considers levels of policy ownership, and promotes legitimation strategies for effective implementation processes. So, the degree to which a policy problem-design integrates effective mechanisms for policy communication, policy transfer, and translation strategies to the citizenry and relevant stakeholders is considerably central for effective implementation processes. As such, policy-visibility enlists strategies of policy advocacy, policy entrepreneurship, policy learning, stakeholder consultations, policy think tanks, policy consumption, and policy transfer and translation within and across public administration. Further to this, policy-visibility prescribes strategies that integrate both behavioral, environmental, and structural organizational and political dimensions of policy. This may in turn influence the communication and the transfer and translation processes of policy contents. That said, policy-visibility as a concept can assist with explicating the top-down and bottom-up implementation synergies, including locating the macro- and microscopic repertoires of policy-making contexts, or what can be termed as *anthropology of policy* (Shore et al. 2011).

However, the utility of policy-visibility also automatically brings to fore its flipside of *policy blindness*. The latter describes, for example, loose dissemination, abstract interpretations, limited knowledge on the policy, loose institutionalization and internalization, etc. of public policy processes. Thus, unlike policy-visibility, policy blindness describes ineffective coordination of policy design, poor knowledge of policy contents, and related implementation hiccups. That is, sometimes (and in most cases) policy implementation failures are chiefly as a consequence of either or a combination of components of policy blindness. Therefore, by discerning policy-visibility in this way, students of public policy can explicate intricacies of public policy processes, especially, with regard to the fuzzy ambience of the points of engagements in policy implementation in public administration.

Even though, the broadness of policy-visibility approach may also render it conceptually vague and fluid, it can apparently reduce some forms of implementation deficits. This is by enhancing policy development, policy knowledge, and dissemination. Actually, some structural policy-visibility strategies, namely, agencification, public-private partnerships, and cognitive strategies such as public sensitization, capacity building, trainings, etc., have been critical in enhancing implementation processes in public administration. Thus, policy-visibility as an approach is nonlinear and may bear overlapping correlations or feedback linkages with different components of implementation. This is captured in Fig. 1 below.

As will be further demonstrated in the later discussions in this chapter, the simplest presentation of policy-visibility involves demonstrating dimensions of policy promotions, how they come about, and common challenges confronted in enhancing it in public administration. But due to limited space, this task will only delve on policy promotion dimensions as policy-visibility strategies alongside addressing the following question:

## How Can Governments or Policy-Makers Enhance Policy-Visibility and Implementation?

In enhancing visibility of a public policy, policy-makers can combine different strategies to disseminate and transfer critical knowledge or information about the policy to targeted groups and stakeholders. This may range from pursuit of simple yet influential strategies such as

**Policy-Visibility and Implementation in Public Administration, Fig. 1** Simplified model of *policy-visibility approach of policy implementation analysis*

broadcasting through billboards; sponsoring television and radio advertisements, debates, and talks; and using posters to rather more bureaucratized strategies such as research and training of bureaucrats, engaging political executives and actors, conducting workshops and seminars, and resource mobilization. Some of these strategies are briefly explained below.

## Identifying the Right Audience and Integration of Key Actors

Prior to the policy announcement, the government needs to have unequivocal construction of both the policy problem, the audiences, and audience characteristics (i.e., matching the policy to targeted and non-targeted audiences) besides matching facts with value/belief characteristics of target groups. This can involve adopting pragmatic strategies for addressing competing value systems characteristic in the diversity of the audiences. Audiences in this case include different societal members and both formal and informal actors, i.e., public and political administrators, non-governmental organizations, eminent persons in the society, and opinion leaders. Either way, these actors are in the position to influence policy implementation and outcomes. Religious leaders, community, and political leaders are definitely critical towards informal mobilization and communication of the policy in their constituencies. In other words, as could also be seen in the study by Brownson et al. (2018: 104) on dissemination of public health policy knowledge "characteristics of the audience are important in shaping a dissemination strategy."

In policy-visibility approach, appropriate identification of policy beneficiaries, actors, and possible benefactors does not only build policy legitimacy and ownership, but it potentially also creates a constituency that is likely to present collective platforms for policy development. Within these platforms, accruing bargains and

trade-offs on policy adoption can become consolidated for effective implementation. Identification of the right audience may also further internalization of policy, which are central in addressing ambiguous framing of the policy problem, policy communication, and coordination gaps in policy-making processes. Moreover, locating an appropriate audience can essentially assist with policy simplification, which, in consequence, can reduce coordination and institutionalization breakdowns thence expediting related implementation processes. This is because identification processes elicit organic consultative, participatory, and bargaining decision-making processes, which subsequently may locate points of conflict and/or the tendentiousness of policy contents within the target group. Therefore, identification of the right audience and actors as strategies for improving policy-visibility may enhance integration of implementation processes and innovation systems (IS) in public administration. Alternatively, these implementation processes and innovations can foster knowledge exchange, communication, and institutionalization processes and thus improve policy-visibility.

### Policy Advocacy as a Strategy of Policy-Visibility in Public Administration

Policy advocacy generally "involves a deliberate process of influencing decision makers or influencing a social or civic agenda in order to build political will around [policy] action" (Gen and Wright 2013: 166). Policy advocacy's largely bottom-up and citizen-oriented strategies are critical in ensuring that policy decisions are implemented. Thus, as a critical policy activity, policy advocacy is key in policy promotion leading to enhanced policy-visibility. Although conceptually fuzzy, policy advocacy generally includes lobbying, policy campaigns, and media exposure. Lobbying includes public and private communication with legislators and political and administrative executives. Policy campaigns include such activities as writing opinion columns in leading newspapers, conducting large-scale advertisements, securing policy endorsements by prominent persons and celebrities (who can also be specifically appointed as ambassadors of the concerned policy), making documentaries/films, using newsletters, creating chain of emails to concerned groups, etc.

Policy advocacy additionally enlists "educating the public; providing information and resources to individuals in need of help; going into court; commenting on regulations; and helping individuals get benefits or services to which they are entitled" (Amidei 2008: 1). Policy campaigns may educe healthy discussions and engagement platforms that, ultimately, can reduce effects of policy politicization. This can come with identification of critical areas of concern or points of general consensus between contending groups, especially, when communicating contentious public policies such as on immigration and smoking ban. Inasmuch as strategies of policy advocacy have often been associated with non-state actors, public administration with its managerial ambitions can engage in similar processes besides adaptation of collaborative implementation strategies, the use of social media platforms like Twitter, and strengthening research-policy-practice linkages, etc. to enhance policy-visibility for effective policy implementation.

### Participating and Tackling Media Framings of the Policy

There is no contention that the media is critical in the framing and dissemination of information on public policies. The mass media particularly holds the key in defining how policy framing and communication to the general populace take shape. Actually, policy announcements are mostly dispensed through the media or are sometimes caught up tackling unintended media framings of the policy. Frame-setting and frame-building activities by the media alternatively influence audience's framings and interpretations of policy contents and existing linkages. By availing different frames of reference, media expositions can locate different policy linkages that border on "social norms and values, organizational pressures and constraints, pressures of interest groups, and ideological or political orientation of journalists" (Scheufele 1999: 109).

Therefore, policy-makers should ensure that the policy elicits viable and appropriate frames

of references in the media by having well-defined and simplified policy structures. Key policy contents should be properly abstracted to be understood by administrators, politicians, the public, and stakeholders. Consequently, media framings as a policy-visibility strategy may address problems linked to the complex nature of policy structure and cognitive limitations, especially problematics of experience and learning that characterize policy knowledge and internalization. So, tackling media framing issues can direct bonding with and implementation processes of the policy in public administration at all levels.

### Conducting Evidence-Based and Inclusive Policy Training

Policy training involves inducting and educating public administrators on the policy to become policy agents. This exercise should be evidence-based and sensitive to different policy environments within and outside public administration. Besides fostering internalization of the policy, policy training instills practical skills needed to effectively counter implementation uncertainties, interpretations, and communication and coordination deficits. Because public organizations are involved in creating collective efforts of the general population, policy training is key to this process, mainly in processing of information and generation of policy knowledge (Pressman and Wildavsky 1973).

Policy training partly delves on the translation and awareness creation both within and outside public administration. Although street-level bureaucrats rarely make the fundamental policy decisions, they are in the front line of development and hence exercise great influence on policy-making processes (Crawford 1960). Thus, even though training of civil servants about the policy design is often rare in public administration, it has great potentials in improving policy knowledge and development through subsequent public-private partnerships and policy networks and strengthening policy research linkages. Besides, the performance of administrators has been found to improve with the transfer of skills and technology through policy training activities. Training activities on the policy can potentially seal off capacity- and skills-related problems common in implementation processes. The degree of policy-visibility is therefore appended on the extent to which public administrators possess scientific knowledge and interpretations of policy contents. This would most likely drive effective communication, institutionalization, and coordination both within and outside public administration.

### Establish Effective and Broaden Financial Resource Mobilization Strategies

In this era of public governance and diminishing public financing, financial profitability and budgetary support are fundamental performance indicators of public bureaucracies insofar as building policy capacity, i.e., competencies and capabilities important to policy-making, is concerned (Wu et al. 2015). Studies show that private financing, for example, facilitates the public understanding of the public policy to counter misguided public practices and stereotypes that may influence implementation processes. Therefore, levels of resource allocation and financial mobilization can promote organizational commitment to policy dialogues, information sharing, and coordination between engaging public bureaucracies and partners or funders. Eventually, this may improve organizational visibility and capacity leading to enhanced visibility of the policy. For instance, the degree of resource allocation and mobilization to accountability institutions will most likely result in increased visibility of anti-corruption or compliance policies in public organizations. Retrospectively, internal and external financial resource mobilization is central to achieving effective policy implementation outputs.

Indeed, the viability of policy implementation is ofttimes tied to budgetary questions, i.e., resource availability and mobilization both within and outside public administration. Variance of resource mobilization depends on a particular policy type. So, financial resource determines levels of organizational commitment and the degree of policy communication and institutionalization. It automatically comes with the creation and strengthening of policy networks and partnerships in public administration, which eventually

*put the word out* about the policy. Therefore, financial resource mobilization is characterized by balancing, reconciliation of interests and policy objectives, stakeholder consultations, and defined implementation timelines. Processes of resource mobilization organically push policy-makers to reach wider groups of people, hence increasing policy prominence or improved visibility.

## Conclusion

This chapter introduced and delved on some key components of policy-visibility as an approach to policy implementation analysis in public administration. It is demonstrated that policies may vary in terms of influences and commitments they elicit towards implementation and that policies may simply fail based on the degree of their visibility or promotion by policy-makers and entrepreneurs to relevant political and bureaucratic actors as to the citizenry. It is shown that policy-visibility and implementation outputs bear nonlinear correlation that may elicit feedback relationships. Policy-visibility integrates both behavioral, environmental, and structural variables that can elicit effective policy communication, translations, knowledge exchange, internalization, etc. of policy designs and contents, hence furthering their implementation. So, policy-visibility approach delves on feasibilities of implementation processes measured by the degree of knowledge acquisition and exchange in designing and communication of public policies within and across levels of public administration. The relevance of policy-visibility therefore draws on recent efforts to identify practical synergies between theory and practice through the generation of evidence-based policies to narrow the gap between policy designs and implementation realities in public administration. Recently, most leading journals in public administration have indeed focused on studies that can assist with narrowing the gap between policy research and practice. This is thought to bring on board practitioners who influence public policies though they are outside public administration where these policies are implemented. Yet, either way these efforts have been in attentive to visibility concerns much as they have been critical in enhancing policy-visibility and exposing implementation pitfalls.

Policy-visibility approach demonstrates that tensions and the multi-actor, multilayered, and complex nature of public policy processes can also serve as a platform where policy-friendly strategies can be harnessed to promote policy knowledge and development. This would ultimately enhance policy dissemination and help with identification of the degree of policy tendentiousness and integration of key actors and stakeholders. Pooling of resources by public administrators, competence upgrading, and building evidence-oriented technical capacities advocated for by the policy-visibility approach can enhance managerial objectives of public policy such as strengthening partnering and partnerships networks. Appropriate training of public bureaucrats on the policy design and contents could also turn them into policy agents besides implementers, thus minimizing tensions between competing value systems in public organizations and policy facts. In short, policy-visibility approach promotes rigor in policy-making and development, sensitivity and attentiveness to policy environments, and objectiveness and adoption of comprehensive yet specific policy designs and implementation processes to counter unintended negative consequences often linked to the cognitive, behavioral, and structural dynamics of implementation processes in public administration.

## Synonyms

Comparative administration; Democracy; Governance; Politics; Tunisian An-Nahada and Bangladesh Jamat-e Islam; Turkey's AK Party

## Definition

To determine the legacy of Turkey's AK Party, we examine the policies of the Tunisian An-Nahada and Bangladesh Jamat-e Islam (BJI) parties, which are arguably related to Islamic political ideology and were introduced to the world as moderate-conservative political Islam parties. This entry examines the nature and processes through which a country's administrative features are shaped. Three parties from three regions of the world are compared – the Turkish AK party from the Middle East and Europe, the Tunisian An-Nahada party from the African and Arab region, and the Islamic political party BJI from South Asia. Although the countries have distinct socio-cultural issues, political backgrounds, historical perspectives, and economic differences, they also have many similarities. This entry examines these political parties' histories, political ideologies, and compatibility with democracy from a theoretical perspective on governance, administration, and ideology of a political Islam system.

## Introduction

The majority of the Muslim world has struggled for democracy and democratic institutions. Some countries have achieved good outcomes, such as Turkey, whereas other countries have failed to acquire that position, such as Egypt and Tunisia. Many western and non-western scholars have argued that the Turkish AK Party (AKP; *Adalet ve Kalkinma Partisi*, the Justice and Development Party), the Tunisian Harakat al-Nahda (Renaissance Movement), and Bangladesh Jamat-e Islam (BJI) are the "moderate conservative," "mainstream Islamist," "post-Islamist," "Muslim Democrats" and emerging "liberal Islamic parties" in the world (Kosebalaban 2011: 8; Özbudun 2006: 543–557; Bokhari and Senzai 2013; Bayat 2007; Yilmaz et al. 2017). AKP has a very strong connection to the former Islamist movement National Outlook (Milli Görüş) and Virtue Party (FP), which were referred to as the "post-Islamism" and emerging "Muslim Democrats" because of their historical linkages, political

ideologies, and democratic phases. The Tunisian An-Nahada party was assumed to begin the new transformative institutional arena of post-Islamism and Muslim Democrats, particularly recently by the founding president of the An-Nahada Party, Rachid Al-Ghannouchi; conversely, BJI is still facing the tertiary methodology of conservative and traditional political Islam.

In terms of democratic political values and governance systems, the AK Party in Turkey has much more democratic experience than the other two political parties. In this regard, it is difficult to compare the AK Party's current situation with two other political Islamist parties. One question is always raised in an academic environment: Is the AK Party destroying Political Islam or it is the model for the future of Political Islam (or Post-Islam). A political Islam method developed by the AK Party may be accepted or rejected by the global political Islam movement. When it comes to the compatibility of Political Islam with democracy, the position of the AK Party is seen as very positive compared with other Political Islam parties. However, the question remains whether the AK Party is an Islamic party at all.

Many scholars have argued that the AK Party is one of the most effective modern versions of political Islam because of its historical linkage with the conservative Islamist party. However, a very important question in the political Islam environment is whether Islamists should accept the AK Party as their model? The party has no visible structural linkage with Islamism or Islamist politicization. The common ideology-based political Islamist parties such as An-Nahada, Muslim Brotherhood, and Jamat-e Islam have plans to use AKP as their model, despite their socio-cultural, historical, and structural differences. When it comes to the border object and concept of "*Ummah*," almost all moderate conservative political Islam parties have the same target. However, their methods to reach that situation are different. (The "*Ummah*" concept itself is very controversial for a nation-state.)

This study aimed to answer the following questions: 1) Do the AK Party, An-Nahada, and Bangladesh Jamat-e Islam have historical and ideological differences in their objectives and principles; and 2) are the political ideologies of An-Nahada and Bangladesh Jamat-e Islam compatible with democracy in terms of their governance systems from a theoretical perspective?

## Link Between Turkey's AK Party, Tunisian An-Nahda, and Bangladesh Jamaat-e-Islami: Theoretical Foundation

To understand the ideological background of these three parties, it is important to know the discourse that links the political Islamist parties' socio-cultural practices to their countries' democratic values and culture. To articulate the comparative methodology in terms of history, ideology, and socio-cultural practices, discourse analysis is very effective; discourse is used to examine how language (spoken and written) is used to determine the systematic links of society and culture (Deacon et al. 2007: 152; Gee 2005). A political party's activity can be recognizable through their agenda and objectives, which are described in posters, leaflets, campaigns, and even constitutions (Römmele 2003). Therefore, to examine the historical legacies and ideological substance of these three political parties' backgrounds, discourse analysis is very important, especially for the links between socio-cultural realities and their correlation with democracy.

Despite clear tensions, the two parties and the legacy of the AK party are somehow ideologically and theoretically influenced by the Muslim Brotherhood (MB) in Egypt. The MB party advocates to return to the Quran and the Sunnah accordingly with Islamic values and ethics; however, many western states have suspected that the brotherhood can spread western context in 1 day (Bayat 2007). In any case, it is the most dominant party, especially with regard to the ideological basis of Political Islam; the party is the most successful Islamist group in Egypt and in the world (Rubin 2010). Theoretically and empirically, it has been shown that the MB was the first modern Islamist group and the initiator of political Islam in Asia and Africa, even in Europe and North America. Moreover, it has the largest network around the world. BJI, An-Nahada, and the previous root of

the AK Party were influenced by and linked to this organization. Today, the website of the Muslim Brotherhood claims to have branches in over 80 countries.

The term "democracy" is derived from the Greek words *demos* and *kratos,* which refers to people's rule or people's sovereignty (Flanagan et al. 2005). Other definitions of democracy include that of Abraham Lincoln, who stated that "democracy is of the people, by the people and for the people" (Haass 2002); on the contrary, Winston Churchill described democracy as "the worst form of government except for all those other forms that have been tried from time to time" (Quoted in Flanagan et al. 2005; Jesse Mechanic 2017). Scholars argue that democracy is meant to be a belief of freedom, with democracy blooming through elections, voting systems, and freedom of expression; ultimately, human dignity will be sustained by the democratic system (Osman 2002: 86). Drammeh argued that democracy means equality and distributive justice for creating a distribution of power (Drammeh 2006). Overall, the theoretical concepts express that democracy can be defined by three specific points: sovereignty, freedom, and social justice. However, these three concepts were selected by western scholars; an Islamic political thinker's opinion may be slightly different.

Some common questions focus on the field of democracy and its correlation with Islam. For example, what are the Islamic views on democracy? How does Islam measure the concept of democracy, either as a western-secular democracy or Muslim democracy? Finally, is democracy compatible with Islam or not, especially in terms of sovereignty, freedom, and social justice?

Searching for the term "democracy" in the field of Islam and its discourses is very difficult. In Islam's revelations to the world, even the terminology of democracy comes from a totally different perspective, time and environment. Many Muslim scholars, such as Drammeh (2006), Osman (2002), and Safi (1999), as well as non-Muslim thinkers such as Esposito and Voll (2001) and Kramer (1996), have argued that the issue of democracy can be related to the "*Shura*" concept of Islam, which is often referred to in the Quran. Since Prophet's period, the *Shura* has been found in all matters of politics, economics, and social issues, indicating that the consultation and decision-making process has been exercised since the early times of Islam. "However, some Muslim countries have interpreted this great concept to meet their own interests." For example, Saudi Arabia has the Consultative Assembly of Saudi Arabia (also known as Majlis Ash-Shura or Shura Council), which is the formal advisory body of Saudi Arabia and is an absolute monarchy. In Iran, the Iranian Guardian Council is mandated by the Iranian parliament and constitution, even when it comes to the Political Islam party. It is also installed in the Muslim Brotherhood, An-Nahada, and Jamat-e Islam of Bangladesh, India, and Pakistan.

According to clarifications from the Quran, the meaning of *Shura* is explained in verse 3 of *Surah Imran:* "It was thanks to Allah's mercy that you were gentle to them. Had you been rough, hard-hearted, they would surely have scattered away from you. So pardon them, and pray for their forgiveness, and take *counsel* from them in matters of importance. And when you are resolved on a course of action place your trust in Allah; surely Allah loves those who put their trust (in Him)" (3:159). In this verse, the word *Shura* is used to explain the counsel with decision-makers. Democratic values have been present for thousands of years, embedded in cultural and religious practices that might have been lost to history. In Islam, there are many documented instances of active participation of the people with the leaders of their time. This began with the Prophet Muhammad (PBUH) as he was directed by God to seek consultation from his followers and companions when making important decisions (Ahmed 2014). For continuation of a decision-making process, *Shura* is a very important tool, especially when it comes to the people's engagement with social and political matters of Muslim governments for any kind of political issue, such as elections, party candidates, party policymaking, election manifestos, and social issues such as the construction of hospitals and schools. In these cases, *Shura* can be used as a

very effective and professional instrument (Drammeh 2006; Osman 2002).

The leading figures and thinkers in the field of Political Islam – including Maulana Mawdudi, the founder of Jamat-e Islam from South Asia; Hasan Al Turabi, the leader of the National Islamic Front in Sudan; and Syyed Qutub from the Muslim Brotherhood in Egypt – all argue that the "Islamic State" should be the ultimate goal for all Muslims. They believe that Muslims should live under this umbrella, where *Tawhid* or oneness of Allah will be the decisive and eventual purpose in terms of freedom and equality; even the absolute sovereignty will go to Allah (Adams 1983: 115; Haddad 1983: 70; Turabi 1983: 241). However, the new concept of the An-Nahda party in Tunisia is absolutely different. Rachid Al Ghannouchi (2016), the co-founder of the An-Nahda Party from Tunisia, emphasized that An-Nahda is changing its views from "Political Islam" to "Muslim Democrats." Therefore, the An-Nahda party will not focus on religious social, educational, or cultural matters. Rather, it will focus only on politics and ultimately will separate religion from state politics in "the separation of Mosque and State" (Tamimi 2001). An-Nahda will be inspired by Islamic values. Although the concept of "Muslim Democrats" developed by Gannouchi is still obscure and vague, it is a very similar concept to western secular democracy as initiated by one of the leading "Political Islam" thinkers.

Recep Tayyip Erdogan, the founder of the AK Party and the current President of the Republic of Turkey, clarified some thoughts that are related to Gannouchi's opinions on secularism and "Muslim Democrats." For example, Erdogan said, "The state should have an equal distance from all religious faiths" (Al-Arabiya 2016). The reality of Erdogan's AK Party thinking in the socio-political perspective of Turkey is very much motivated by its past roots of "Political Islam," particularly in terms of religious education (Kayaoğlu 2012). However, it should be clarified that the newly formed AK Party did not call them an Islamic party but rather a conservative democratic party. Erdoğan, the AK Party leaders, and the members always avoid defining the AK Party in religious terms: "We are not an Islamic party, and we also refuse labels such as Muslim-democrat" (Taşpınar 2012). Nonetheless, when it comes to their political maturity, experience, and leadership position, many Islamist and conservative political parties want to follow the AK Party as their model. For example, Turkey's AK Party model has soft power impacts on the Middle East's democratization process (Benli Altunisik 2005). To balance Islam and democracy from the grassroots level, economic sustainability, and soft power impacts on the Middle East, Turkey's AK Party was viewed as a model for the Middle East and North African (MENA) regions (Dede 2011). However, the scenario is quite different in the aftermath of the Arab Spring.

## Three Parties from Three Regions: Three Diverse Histories

As described previously, this study focuses on three parties from three different regions: the Middle East and North Africa's Tunisian An-Nahada Party, the Middle East and Europe's AK Party in Turkey, and South Asia's Bangladesh Jamat-e Islam (BJI). These three parties have three diverse histories, backgrounds, and historical importances. For example, the Turkish Justice and Development Party (AKP) has a very strong legacy with Islamist political party roots, such as the Virtue Party, which has a legacy of the National Order Party, National Salvation Party, and Welfare Party. The indicated political linkages show how the AK Party is inspired by Islamists. "Political Islam" in Turkey began structurally through the leadership of Necmettin Erbakan in 1970, especially in the public sphere. It was first appeared as an ideological goal of the *Milli Görüş* (National Order), which was later politically moved to *Milli Nizam Partisi* or the National Order Party on 26 January 1970 by Necmettin Erbakan (Fulya Atacan 2005). The Milli Görüs and Erbakan's political agenda were primarily anti-secular and anti-western, but his political vision was never violent jihadist revolution; rather, it was motivated by an ideological approach (Vielhaber 2012). However, prior to

reaching their current position, the AK Party has a very distressing story. The military would crackdown on political Islamists in Turkey in the name of Kemalism or to protect secularism, as was written in the Turkish Constitution. For example, in 1971, the Constitutional Court banned the National Order Party. Then, the National Salvation Party was banned in 1980, theWelfare Party was shut down in 1998, and the Virtue Party was banned in 2001 for its ideological preferences and purposes, which were viewed as going against the Turkish constitutional principles, particularly the roots of secularism and Kemalism in the history of the Turkish Republic (Taşpınar 2012: 127).

The development of the An-Nahada movement in Tunisia had the same background and goals as Turkey's National Order movement had since 1970. An-Nahda is Tunisia's main Islamist movement. It was started in the 1960s by Rachid Al Gannouchi and his friend Abdelfattah Mourou. Tunisian An-Nahada was also banned, like the Turkish previous Islamist party. Wolf (2017) argued that the An-Nahda's intellectual roots came from the Egyptian MB while the University of Zaytouna was established against French colonialism in the late nineteenth century. The 76-year-old Gannouchi first established this organization as an Islamic movement-oriented party, but it was exposed as a political party after the Arab spring. An-Nahda is not against modernity; rather, it can be considered as a modern alternative Islamic movement in the MENA region. Wolf (2017) articulated how Islam can be more progressive in a contemporary world, with An-Nahda being a good alternative for Arab Muslims.

The history of An-Nahda in the political sphere of Tunisia is not positive. In April 1981, Ghannouchi founded the Islamic Tendency Movement with the object of "reconstruction of economic life on a more equitable basis, the end of single-party politics and the acceptance of political pluralism and democracy" (Kechichian 2011). In the same year, by the end of July, Ghannouchi and his followers were arrested, and sentenced to 11 years in prison. They were released in 1984, but again imprisoned in 1987 with a life sentence, then released in 1988. After this imprisonment, Gannouchi moved to the United Kingdom as a political exile and lived there for 22 years (Feldman 2011; The Time Magazine 2017). Since that time, An-Nahda worked with the secular parties of Tunisia.

The Islamic political party in South Asia, BJI, has the same agenda and goals as An-Nahda and MB: to work for an Islamic movement in the world. BJI is a much more religious Islamic conservative party than An-Nahda and the previous Islamic roots of AKP in Turkey. Jamat Islam (JI) in South Asia was founded by Maulana Maududi (1903–1979) in 1941. Since its foundation, it has worked both in the Political Islam field and the Islamic Movement arena; however, the main goal of JI is to establish an Islamic values-oriented state (Hashmi 2011). It is one of the oldest political parties in the history of the Indian subcontinent. The initial objective of this movement was aimed at the socio-religious development of Muslim communities in the colonized Indian subcontinent, which now includes the three countries of Bangladesh, India, and Pakistan.

According to the "two-nation theory" in 1947, Muslim-majority Pakistan and Hindu-majority India were established. The JI movement continued its function both in India as Jamat-e Islam Hind (JIH) and Jamat-e Islam Kashmir (JIK), as well as in Pakistan as Jamat-e Islam Pakistan (JIP). However, after the independence of Bangladesh from Pakistan in 1971, the Bangladesh Jamat-e Islam (BJI) continued its political and Islamic movement activities with completely independent policies and leadership under the Bangladeshi citizens since 1979 (Amin 2016: 25). The BJI started their movement in Bangladesh through social movement activities on the Indian subcontinent, including with Nepal, Sri Lanka, and Kashmir. This movement and its political activities are not limited by the confined sovereign country's boundaries; rather, it is active in various countries, such as in the Islamic Society of North America (ISNA), Islamic Forum Europe, and UK Islamic Mission. All of the groups have their own self-governing structures influenced and inspired by the Maulana Maududi (Haq 2010; Reza Nasr 1994; Nasr 1996; Riaz 2010).

The theoretical and conceptual foundations of Jamat-e Islam have been clarified by its founder Maulana Maududi, who believes that nationalism

and secular politics should be denounced in an Islamic state, where Muslims should be safe to get their political rights and freedom (Amin 2016). However, BJI's history of suffering, torture, and repression is not much different from the other Islamic-oriented political parties around the world. Since the creation of Bangladesh, BJI was banned for 5 years due to its ideological roles, which are against the secular establishment of Bangladesh. BJI lost its top five Islamist leaders, including the chief, who was hanged by order of a war crime tribunal due to the party's controversial role in the Bangladesh war of independence against Pakistan. However, the international media, news analysts, and scholars believe that the hanging of top Islamist leaders in Bangladesh was not for their roles during the liberation of Bangladesh; rather, it was politically motivated because of their continuous success in electoral democracy, which ensures the ideology of BJI in the societal perspective of Bangladesh (Amin 2016).

## Islamic Values and Ideology Versus Democratic Values: Convergence or Divergence?

Most Islamic thinkers, such as Maududi, Banna, Turabi, and Qutub, believe that the most important way to understand Islamic values and ideology is to link the social, political, cultural, and economic behavior of Muslim people with "hereafter," where "*Iman*" will be the main measurement to acknowledge this society by establishing an Islamic State. Furthermore, Islamists believe that "Islam is the complete code of life," so Muslims should live under the umbrella of Islamic values in an ideology-oriented society. However, scholars such as Hasan (2011) have emphasized several measures of Islamic values from the reference of a Political Islam party, to determine whether it is compatible with democratic and secular values. For example, according to the constitution of Bangladesh Jamat-e Islam, secularism should be replaced with "absolute faith and trust in the Allah Almighty," so the introduction of a parliamentary constitution would be like *Bismillahirahmanir Rahim* ("In the name of Allah, the Merciful, the Compassionate"). In this measurement, the system of the AK party and the current governance system of An-Nahda would be exempt. In its party constitution, the AK party very clearly states that it is a conservative democratic party in which religion will be separated from state institutions. Even the recent move of An-Nahda shows that it has a very clear opinion that the state will be a secular institution (Yildirim 2017). As such, politics will be the only focus rather than religion.

Political Islamists used to generalize the quotations from Quranic verses and Prophet's speeches for their leaders' speeches in public meetings and government offices. They also used posters to display religious objects even when state institutions and political party were to be secular (Hasan 2011). Leaders from An-Nahda in Tunisia and Jamat-e Islam in Bangladesh (but not the AK Party) used religious speeches or quotations from religious books in their public meetings to persuade people. Because of the secularism definition of AK Party, the Turkish President Recep Tayyip Erdogan said in many public meetings, "The state can be secular but not the people." Scholars called this "neo-laicism" or "neo-secularism," even though this secularism is contrary to Turkey's previous secularist concept, which was like a French model of secularism (Mahjar-Barducci 2011). In addition, the Political Islamist Party offers prayers or *dua* on special occasions related to religion or governmental institutions. This kind of activity is very common, especially inside the political party's system.

The internal and external political environments, political activities, political slogans, and political campaigns of the three parties are based on the specific religion's system, which more or less represents one religion' groups (Hasan 2011). The most important measurement to identify an Islamic value-oriented and ideology-oriented society is when the political party and its government establish new education policies that encourage the young society to study a specific religion and specific language. For example, the BJI education policy prioritizes "Islamic Education" and "learning Arabic language." Even in Turkey, the controversial secularist and anti-AK political parties say that the current government gives too

much preference to Imam Hatip schools (religious schools) rather than the secular education system. Moreover, the liberal secular society of Turkey questioned the current government's huge budget for opening new mosques and religious institutions, although the AK Party always refuted those kinds of statements.

Apart from the discourse analysis, these measurements can be greatly debated following western secularist concepts. Still, Islamist and conservative democratic individuals argue that it is up to the people to decide during elections and in the voting system. If the people are unhappy, they can show it through their electoral rights. This was the case with Turkey and the continuous election of the AK Party in Turkey's electoral process from 2002 to the present.

## Conclusion

As discussed in this entry, "Political Islam," "Conservative Democratic Muslims" or "Muslim Democrats" want to establish a new discourse in terms of political terminology and democratic practices. It remains unclear whether the AK Party or An-Nahda's new political campaign will destroy the Islamist or Political Islam, or whether they will be an example for other "conservative democratic" parties around the world. Additionally, the austerity of "political Islam ideology" and its correlation with democracy is still vague, particularly when it comes to discussing an Islamic-oriented society or western secularism. If these three parties adopt the western model of secularism and democracy is an absolute democratic movement for their countries, then there will be a lot of criticism for them in terms of their ideological objectives. However, by considering the beliefs of those political parties in the account of their socio-culture and political culture, then perhaps we can uncover new variables to measure a society's democratic future.

As history shows us, Islamist and ideology-oriented political parties have a very promising future in Muslim countries, if they can realize their political objectives on time from the perspective of their people's desires. In the field of Political Islam, so many political thinkers from Muslim countries follow the AK Party as their role model. However, a country's Political Islam party should develop its own unique model that can ensure the people's rights, freedom, sovereignty, participation, equality, and social justice, which will be compatible with democracy.

# Political Appointees and Career Executives

Mokgata Matjie
Industrial and Organizational Psychology Department, University of South Africa (Unisa), Pretoria, South Africa

## Synonyms

Bureaucratic careerist; Career official; Careerist; Civil career official; Civil servant; Director-general; Government official; Minister; Non-career official

## Definition

*Political appointee*: refers broadly to any employee who is appointed by the president.

*Career executive*: any person appointed to a high administrative and policy influencing position within the state/government public administration or civil service in the capacity to render management advice to political appointees.

*Politicization*: is a situation whereby political appointees' control of the administrative sphere is growing and career executives (bureaucratic autonomy) are powerless or in retreat.

## Introduction

Political appointee exist across all nations with any type of governance system in the world. Their appointments is often seen rewards for the loyalty for the president after a successful campaign. However, scholars' advice that is should not be seen as a reward but only be seen as a chance to serve the public interests or an assignment of public duty.

Political appointments exist to assert the president's political agenda by relishing maximum control of the government. The president usually appoint those seemed loyal; hence, political appointments are often used imprecisely or interchangeably with various types of political rewards, including patronage, clientelism, nepotism, or cronyism (Piattoni 2001).

In democratic countries, presidents are democratically elected and as such, they are expected to carry out their campaign promises by directing the executive branch of government. Thus, appointments of political appointees in executive positions to lead various portfolios or departments are necessary and legitimate. Political appointees assure responsiveness to presidential policy priorities throughout the executive branch. In addition to democratic legitimacy, political appointees bring new energy and new ideas to the government from the private sector, universities, and state and local governments.

To promote and implement such policies, political appointees need assistance by qualified and experienced experts, the career executives. Career executives exist to serve any and every administration diligently and competently without regard to their own personal political beliefs. They are indispensable to the success of the political appointee(s) with whom he or she works. They serve as a link between these political appointees and the rest of the government workforce in a particular department or institution. However, one of their main challenges is presidential transitions, just like political appointees. Career executives' position can be established only in the top managerial levels of government institutions or departments, and the role is characterized by broad responsibility for policy implementation and extensive participation in policy evolvement.

Political appointees perceive their roles as to strengthen political control over the administrative system in their favor and to reduce bureaucratic autonomy enjoyed and celebrated by career executives. Political appointees' perceptions are deemed "politicization" and the result is the encroachment into career executives' roles and autonomy.

Politicization is possible because the ministers have the power and control and enjoy the support of the president over what they perceive to be disloyal civil servants. Career executives who are not responsive to request of ministers are

often threatened with dismissal as result civil servants abandon their impartiality under pressure from political agents (Hustedt and Salomonsen 2014).

Inevitably, role conflict exist between these two groups, as concluded by Kristinsson, (2016) that there is a growing political control of the administrative sphere and bureaucratic autonomy is in retreat. Downs's well-known typology of bureaucratic roles distinguish between political appointees and career executives in terms of their motivations, thus attempting to limit encroachment and ultimately role conflict. This role conflict necessitates the need to examine the different roles of both groups and to clarify them. Political appointees and career executives need not be in conflict but should work together for the sake of public interests as they supplement each other.

## Roles of Political Appointees and Career Executives in Public Administration

Political appointees serve a number of different roles and do not necessarily conform to a single type. Their roles may also vary considerably from one case to another and develop differently (Hustedt and Salomonsen 2014).

Their main roles are made by politician or president based on the discretion they have for politicizing appointments. However, the roles of career executives are usually included in the employment contract. The source of conflict between political appointees and career executives is the motivation and attitude for being in the role. Political appointees aim to do anything necessary to achieve or reach political agendas of the president, even if it means breaking rules at times, whereas career executives exist to uphold those rules and advise the politicians on the correct processes and procedures, what can be done and what cannot be done.

Downs's well-known typology of bureaucratic roles distinguishes between climbers, conservers, advocates, zealots, and statesmen. These roles indicate the motivations of political appointees and career executives in government departments across the world. Scholars have documented that the two groups differ in important ways due to what they represent and what they bring to the department or institutions. The crucial point is that political appointees and career executives occupy unique roles that help explain their respective attitudes and behaviors.

Downs's (1967) emphasis is on the behavioral rather than formal roles of political appointees and career executives. Both political appointees and career executives or bureaucrats are rational and self-interested. Basing his typology of officials on individual motivation, Downs posits five ideal types: climbers, conservers, advocates, zealots, and statesmen.

1. Climbers and conservers are wholly self-interested officials. Political appointees are the climbers because they are motivated by their own status, power, and income. The jobs are short term, as such, they seek to climb the ladder as quick as possible to ensure that by the time there is government transition, they are well placed.
2. Conservers seek only their own security and convenience. These are career executives whose convenience are the existing rules and regulations, which they strictly follow. Failure to follow rule might lead to dismissals, thus losing their security. Both groups are considered mixed-motive due to self-interests, but they have altruistic motives, which is to serve the public interests. Climbers attempt to serve based on the policies and campaign promises and conservers attempt to serve by following rules and processes.
3. A wide range of incentives motivates advocates, but primarily they promote the good of the government department or institution they work for (Downs 1967). These are the career executives, who enjoy high salaries and benefits for being a top official, but still their main prerogative is the government department or institution they work for, and it will be difficult for them to compromise their values to satisfy politicians.
4. Zealots are loyal to a particular set of policies, which Downs calls "sacred policies." These

are the political appointees because they can at all costs harm the government department or institution they lead in order to support such policies. They are susceptible to corruption, bribery, nepotism, intimidation, and all sorts of ammunitions they can get to support their policies.

5. Finally, statesmen are motivated by the good of society or "public interests" as a whole and, thus, may support measures that would harm their own organizations and careers so long as these measures are believed to be good for society. Both groups are likely to represent the public interest, although political appointees focus on supporting the president's agenda and career official's focus on the department or institution's agenda (Heclo 1977; Maranto 1993).

The existence of the difference in behavioral roles and attitudes usually stems from various issues as discussed below.

## Differences Between Political Appointees and Career Executives

These two groups have different motivations and objectives even though they all want to serve the public interests. Their methods of serving the public interests are different. For example, the political appointees may bypass rules and regulations to serve the public through the president, whereas career executive's aims to always follow the rules and regulations to protect and serve the interest of the public.

Broad literature suggests that political appointees and career executives differs in terms of the following (Table 1):

These differences are further explained clearly by the ideal types (climbers, conservers, advocates, zealots, and statesmen) as presented by Downs (1967).

Political appointees' short-term focus and their lack of complete job security implies that they are climbers, as compared to career executives whose long-term tenure give them job security and they are more likely to be conservers.

Political appointees are extremely ideological which makes their loyalty on policies of the political party, which makes them zealots, whereas career executives are rational people who become advocates for their organization than are political appointees, who are instead more likely to represent the president's views. Both groups are likely to represent the public interest, although political appointees focus on supporting the president's

**Political Appointees and Career Executives, Table 1** Differences between Political Appointees and Career Executives (Based on Downs, 1967, Heclo, 1977, and Maranto, 1993)

| | Political appointees | Career executives |
|---|---|---|
| Political ideology | • Political appointees tend to hold more extreme political ideals.<br>• Political appointees are overwhelmingly from the same political party and typically have little experience working across party lines<br>• Political appointees are often referred to as zealots or ideologues | • Career executives tend to be centrist<br>• Career executives may be required to serve under political appointees of different political parties<br>• Career executives are relatively pragmatic |
| Time horizon | • Political appointees tend to be driven by short-term political or career-advancement considerations<br>• Political appointees usually have some link to the winning political campaign<br>• Political appointees serve for relatively short periods and often set their sights on further advancement, either to higher level political positions or to the private sector | • Career executives tend to take a long-term approach to public policy<br>• Career executives take a long climb up the organization ladder<br>• Career executives have reached the pinnacle of the career service and stay in place for long periods of time |

## Can Political Appointees and Career Executives Coexist Effectively in a Bureaucratic Society?

Political appointments are made occasionally, whereas appointment of career executives happens regularly. In addition, more often than not, ministers or political appointees find bureaucrats to be loyal and reliable, thus no need to not appoint and keep them. However, if career executives are found not loyal and reliable, ministers have a number of instruments to encourage compliance. Not least of such instruments is the power to transfer personnel, dismiss or not to renew their contract by advertising their position when the five-year contract runs out.

Research shows presidents can exert control over bureaucratic outputs in part by selecting political appointee's intent on forcing resistant career executives to comply with the president's agenda. The broader political environment and the president's own priorities bound the extent of presidential control over the bureaucracy, and it involves a dynamic relationship between political appointees and career executives. Careful attention should however be made, to avoid situations where the political appointees influence career executives to commit fraud, corruption, or criminal activities in pursuit of the president's agendas. If these differences are not well managed, career executives are bound to be fired and replaced with those perceived to be more willing to support the political appointees and ultimately president's agendas.

Bureaucracy remains as the basis organizational and governance principles in governments, despite the trends towards politicization. The bureaucrats or career executives' high turnover would lead to loss of coherence and institutional memory in public administration and seriously impair its performance (Heclo 1977). Hence, it is advisable that political appointees should exercise caution before applying their powers of appointment and firing to the fullest possible narrow-minded extent on career officials.

Politicians should understand that civil servants are simply "dispassionate, upright, and polite" and they can even be "frank and fearless." As such, they are bound by their oath to professions and principles of bureaucracy. According to classical bureaucratic theory, the bureaucracy is essentially an impartial tool of execution with no special interests at heart (Weber 1968).

Political appointees should understand that merit appointments serving to strengthen the long-term capacity of the bureaucracy allow deserving civil officials growth. Career executives are there to serve the political end of contributing to long-term system capacity but disregard narrow party-political or personal motivations of politicians. However, bureaucrats are to shift their loyalties when ministers or governments change, and the civil service culture encourages such a view in most democratic countries.

Political appointees or ministers should not do the following, if they are to co-exist effectively with career executives:

- Assume that career executives are less able or hard-working than their counterparts in the private sector.
- Assume that career executives are unwilling to make changes in policies and/or programs. In fact, they typically have many good ideas for beneficial change.
- Hold career executives responsible for policy decisions of previous government, president, or political appointees. They worked under the direction of the president and political appointees, as such they had responsibility to implement policy decisions that were legal and within the mandate of their departments or institutions.
- Shield yourself from, and ostracize, career executives.
- Assume that they "not on the team" when they advise on the possibilities and providing the options before implementing any policy decision.

To build a strong beneficial relationship political appointees or ministers should do the following, if they are to co-exist effectively with career executives:

- Build a strong working relationship with career executives.
- Develop open and honest communication to build trust, confidence, and understanding of one another.
- Schedule, early in your term, an off-site meeting with your career executive group to establish working relationships and share information regarding policy directions and management issues.
- Clearly articulate your vision, your objectives to the career executives and have a realistic agenda.
- Be willing to be told what they cannot do (if rules and regulations will be breached) and ask for options from career officials.
- Establish clear reporting channels and methods and solicit advice on anticipated problems with any decision.

## Are Political Appointees as Competent as Career Executives Are?

Evidence exist from research studies on political appointees' lack of management skills, policy expertise, leadership experience, and working networks that facilitate public management. As a result, government institutions or departments run by political appointees suffer from poor management. The frustrations brought by the incompetent political appointees often lead to high turnover of career executives. It is thus important that career executives run the bureaucratic operations of public institutions because they have skills and expertise. The political appointees can oversee and steer the institutions towards the political policies or ideologies of the government of the day.

A shift has, however, been noted whereby political appointees are now better educated than before and have likely served in government prior to their appointment. This might lead to improved quality from institutions run by political appointees. New evidence shows that political appointees stay longer than widely believed and are generally perceived as competent. However, this notion of educated political appointees does not apply to all nations in the world (Maranto 2005).

Scholars conclude that political appointees clearly plays an important role in the bureaucratic public administration system. However, they have less expertise and experience than career executives do. Political appointees are more loyal to the president who appointed them, which triggers corruptions fears and leading to high skepticisms from career executives.

## Conclusion

With political appointee at the helm of government departments or institutions, there is a concern about lack of accountability, administrative inefficiency, and lack public confidence in government institutions (Peters and Pierre 2004). Due to threats, bureaucrats, or career executives may come to identify too strongly with ruling politicians and lose the ability to "speak truth to power." On the other hand, political appointees and career executives have to coexist to envisage a well-functioning democratic system. Career executives exist to support politicians, while politicians can only functions effectively with much needed advise, support, and assistance from career officials.

Political appointees and career executives together have divergent and equally important roles to play in any bureaucratic public organization. However, their relationship is always hampered by role conflict. The minister is a politician (political appointee) and the director is an administrator (career executives) appointed for his/her expertise and for continuity. The political appointee provides the energy and political support needed to run a government, whereas the latter provide continuity, expertise, and institutional memory that can help run the institutions of government and ultimately to run government effectively. Politicians' tenure is short and thus they constantly looking for new opportunities, and they exist to support ideological policies and their loyalty to the ruling-party or government of the day is unquestionable. Career executives on the other hand take the permanent supporting role with their loyalty unshaken for the effective and efficiency of the bureaucratic institution. Both

groups have strong desires to serve the public and the nations (high concern for the public interests) (Maranto and Brewer 1998).

Political appointees and career executives' high concern for public interests limits the inevitable role conflict that might hamper their relationship. As a result, a high level of trust and collaboration can be developed between the two groups based on this common ground of "high concern for public interests" (Maranto and Brewer 1998).

Political appointees who oversee the bureaucratic public institutions should be appointed through a careful selection and placement. Sound political appointees are more likely to collaborate with career executives to forge ahead effectively on all issues pertaining to public interests.

Administrative presidency; Patronage; Politicization; Spoils systems

*Political appointees* are found in all democracies, though their numbers, roles, and expertise vary widely across time, across nations, and across subnational units like American states. The term *political executives* includes high-level political appointees but also may refer to top *elected* leaders of the executive in separation of powers governance systems like the USA, presidents, governors, and mayors. In parliamentary systems, political executives are elected officials with direct administrative responsibilities, at the national level prime ministers and cabinet ministers who typically work directly with executive level career bureaucrats (Aberbach et al. 1981; Savoie 1994).

This brief essay will explore the selection of political appointees and their roles primarily in an American context and discuss evaluations of their impact on governance.

Political appointees are those public servants who are not permanent or semipermanent tenured officials but instead likely to come and go with the elected executive branch leaders, typically at relatively high, policy-making levels. A newly elected mayor, governor, or president will fill

politically appointed positions primarily with political supporters through processes distinct from formal bureaucratic merit selection procedures. Political posts are often highly sought after and appointees usually undergo substantial vetting, so for the most part their formal credentials like educational attainment and work experience are sound, in sharp contrast to stereotypes about incompetent spoils system officials. Yet political selection is less regular and bureaucratized than for career civil servants, with considerable media attention and legislators and interest groups playing roles in what are often lengthy hiring processes. These differences in selection processes and criteria mean that political appointees may have broader experience than career executives but typically have less agency-related expertise, a matter we will return to below. Almost by definition political appointees typically serve for far shorter periods than career officials (Maranto 2005; Lewis 2008; Resh 2015).

In an American context, high-level political officials must typically earn confirmation by legislatures, the US Senate for top presidential appointees, state legislatures for gubernatorial appointees, and city councils for mayors. Legislatures often delay confirmations to extract policy or appointment concessions from executives and may use confirmation hearings to message desired policy outcomes. For these reasons and due to ever more detailed reporting rules for prospective appointees (meant to encourage openness and integrity), in the US government the period between designation and confirmation has risen steadily over time. In part for this reason, we have now seen increased use of "holdovers," political appointees from one administration who serve in the following administration, typically in relatively nonpartisan policy areas or where an incoming president supports the policies of his or her predecessor. For example, President Obama kept on Bush second term Defense Secretary Robert Gates, who continued to draw down US forces in Iraq and augment those in Afghanistan (Mackenzie and Shogan 1996; Maranto 1997, 2005; Lewis 2008).

In the modern American presidency, appointees are typically chosen for their ideological and/or personal commitment to the elected president and his or her program, their expertise in a given policy area, their managerial competence, their ethics, and their representation of various constituencies. While representation was originally primarily geographic, since the late twentieth-century religion, race, gender, and more recently sexual orientation have served as the primary representative criteria. These appointment criteria shift over time depending on contemporary political cleavages. One notable exception is political party. Presidents and other elected executives select political appointees overwhelmingly from their party. Exceptions often occur in essentially one party states or cities, where newly elected executives from the minority party may need to reach beyond their party to find sufficient expertise, and to woo additional supporters. In the nineteenth-century political appointments were to a significant degree used to hold political parties together, to reward friends, and to raise money for the parties, since appointed officials were often expected to contribute "assessments," shares of salary to the political party or individual sponsor who arranged the appointment. Indeed elections were largely funded through such "spoils systems," so-called since election victors could collect the "spoils" of office. Save for a few cases such as certain ambassadorships, such practices have largely disappeared in the US government and are uncommon in American state governments. Still, such individualistic and arguably corrupt uses of patronage still occur in cities with weak media scrutiny and non-moralistic political cultures, as well as in other nations. Accordingly some argue that the numbers of political appointees should be strictly limited in polities with insufficient media scrutiny and political competition, or lacking moralistic political culture. Individualistic political culture, most notably, does not censure politicians for corruption, so in such polities increased use of political appointment would likely increase corruption, enabling politicians to essentially sell public posts for party or private gain (Maranto 2005; Maranto and Johnson 2006). Notably, while other forms of corruption are thought to have declined in America, "pinstripe patronage"

(so named since stereotypically powerful officials weir pinstripe suits), use of government contracts to award political supporters, is thought to have increased, and is generally a legal practice (Freedman 1994).

The development of political appointments allowed electoral democracy and expert bureaucracies to coexist. Bureaucracies are relatively stable, hierarchical, expert organizations staffed largely by tenured officials. Bureaucratic expertise permits government effectiveness. Government cannot protect the nation through defense agencies, provide currency with the US Mint, protect the environment via the Environmental Protection Agency, or indeed do much of anything without specialized, expert bureaucracies with the organizational knowledge and capacity to accomplish particular tasks. At the same time by its very nature bureaucracy may undermine electoral democracy since career bureaucrats typically understand policies better than the elected officials who (at least formally) serve as their masters: the information asymmetry empowers career bureaucrats at the expense of temporary political leaders. Bureaucracies usually seek to increase agency budgets and power in manners which may not accord with the goals of the voters and the elected officials they select. In effect, the expertise of bureaucracy may undermine the political responsiveness of democracy. The doctrine of a politics-administration dichotomy dividing policy-making (political) work from bureaucratic (administrative) work is meant to facilitate both bureaucracy and democracy (Kaufman 1956; Niskanen 1971). While often critiqued by analysts, surveys of career and political executives suggest that this concept still holds considerable power among those serving within government agencies (Maranto 2005).

In part, political appointees lessen the information asymmetries faced by elected executives, serving as representatives of the elected administration to the permanent bureaucracy, both presenting expert views to elected executives and pushing career bureaucrats to develop and implement policies preferred by the political administration. Further, given the high expectations faced by American presidents (and other elected executives), increasing the numbers and roles of political appointees are among the few means of enhancing their powers solely under presidential control (Moe 1985). Not surprisingly given the expectations faced by political leaders as well as increased skepticism toward permanent bureaucracies, the numbers of appointees have grown over time in the USA but also in Canada, Great Britain, Australia, and elsewhere (Savoie 1994; Dunn 1997; Lewis 2008).

Supporters of political appointments point out that in the US government, the numbers of appointees have grown less than the numbers of congressional staffers, reporters, and interest group employees, all of whom political appointees must interact with on behalf of the bureaucracy and the political administration. Washington politics is a growth industry, and appointees are actually a lagging sector within that industry; thus Maranto (2005) argues that much of the growth in political appointments reflects increased political work, more bargaining with a greater array of political actors. Such work may entail risks (such as bad publicity) which career officials feel reluctant to take. Further, appointees can also play management roles, turning around low-performing agencies, bringing outsider perspectives and expertise and facilitating cooperation across organizational boundaries. Their very temporary status and outsider perspective empowers appointees to take such controversial roles in the bureaucracy. Maranto argues that in part due to its relatively large numbers of political appointees who act as external change agents, American public bureaucracy at national and subnational levels is more innovative, representative, and effective than foreign counterparts. On the other hand, Suleiman (2003) argues that increased numbers of appointees have degraded the capacity and legitimacy of the bureaucracy in a range of nation-states, crowding out more effective career administrators from important roles.

Though political appointees clearly play important roles, they are typically less expert than career executives and also more likely loyal to the chief executive who appointed them, leading to fears of greater corruption. Generally, public administration academics champion the

permanent bureaucracy and are thus skeptical of appointees, while political scientists, who value democratic accountability and executive (usually presidential) leadership to a greater degree, are more favorably disposed toward political appointees. This is reflected in each field's research and commentary. Further, when an administration supports agency missions, as is the case of Republican presidential appointees in defense agencies, relations between career and political officials tend to feature consensus; on the other hand, when an administration and its appointees attempt to reduce or reorient organizations political-career conflict is almost inevitable, at least in the first years of an administration. Over time, relations tend to improve due to personnel and attitudinal changes on the part of both career and political officials (Maranto 1997, 2005; Resh 2015). Notably, some historical analyses suggest that Democratic and Republican administrations employ distinct managerial strategies, with the latter attempting to take over and reorient government agencies, while the former simply create new agencies to do the work old line bureaus are not trusted to handle (Maranto 2005).

The best recent empirical work on US political appointees is offered by David Lewis (2008). Lewis finds that presidents, at least, are rational. They rarely increase the numbers of political appointees in agencies where expertise is prized or which face risk of scandal. Such agencies are dominated by career officials at both subordinate and executive levels. At the same time, while admitting that political appointees play important roles, particularly in developing long-term strategy, Lewis finds strong empirical evidence that appointees have weaker performance since they have less agency-specific experience and less longevity in office. Lewis suggests that presidents and other political executives recruit more appointees from the career service (as is common in parliamentary systems), or from among those who served in previous administrations in similar posts. Generally, Lewis suggests that further politicization of American government will have diminishing and even negative returns regarding representation, efficiency, and accountability.

Clearly, we need more research on this and related matters, for political appointees in government, and the challenges thereto, will not soon disappear either in the US government, American subnational governments, or elsewhere across the globe.

## Political Approach to Public Administration in Iran's Public Sector

Hassan Danaeefard[1] and
Masoumeh Mostafazadeh[2]
[1]Faculty of Management, Tarbiyat Modares University, Tehran, Iran
[2]Public Administration, University of Tehran, Tehran, Iran

### Synonyms

Politicization of public administration; Politics and administration

### Definition

Politicization of public organizations refers to this fact that administrators in public sectors pay more attention to politics rather than administration.

### Introduction

One of the most popular approaches to public administration is political approach. Generally, political approach to public sector claims public servants should be a partial or bureaucratic advocate. Thus, politicians try to control over public administration could be a reflection of political approach. At the heart of political approach, there are politics and administration, the two simple words with a world of complexity in relation to each other that make one of the most challenging issues for political and administrative experts.

There is no doubt, every administration in every country adheres to politics, but the degree of this adherence in different countries – related to their different situations and backgrounds – is not same. It is a kind of injection of politics in administration that creates a new phenomenon: politicization. Politicization of public organizations has no exact and clear meaning, but generally it refers to this fact that administrators in public sectors pay more attention to politics rather than administration, and, in other word, politics is more dominant than administration in execution of public affairs. Also policy makers, who are expected to be worried about correct execution of public policies, spend more of their time and energy to gain assurance of public sectors' companionship with their political priorities. Political control over public organizations seems the most clear reason for politicizing public sectors. In this way, bureaucratic meritocracy system fades out even in developed countries, so politicization could lead to change of public sector's goals. This struggle is an avenue of discussion for scientific community of public administration, political sciences, and other related disciplines.

Politicization is not limited just to developing countries. Developed countries (e.g., Sweden, Denmark, Germany, France, Britain, United States, Canada, and New Zealand) have the same experience of politicization in their managerial and political systems. As Peters and Pierre noted, unlike the use of patronage appointments in many less-developed countries (World Bank 2001), politicization in the industrialized democracies implies attempts to control policy and implementation (2004, p. 2). But whatever makes this phenomenon different in these kinds of countries is the target of that. So encounter with politicization is different in every country on the base of its political philosophy and public policies, and so it leads to various perceptions of its concept. Peters and Pierre (2004) in their book "Politicization of the Civil Service in Comparative Perspective: The Quest for Control" gathered a collection of several countries' experience about politicization. They talk about the degree of politicization of their public service which includes processes, functions, and consequences. In this chapter Iran is the subject of the study.

Iran has one of the oldest public administration systems in the world. A rich 8000-year-old history of Iran in bureaucracy and public administration can prove this fact. Formation of administrative structures and governance mechanisms has an ancient history in Iran. The Sassanid Empire (224–651 AD) as one of the two main powers in Western Asia with an expanded governance domain made one of the powerful civilizations for Iranian. An empire with a specified hierarchy of political system includes executive, judicial, and legislative powers. Also before them the Achaemenid Empire (550–330 BC) formed some important organizational and administrative principles that had significant influence on the Roman Empire's public administration. Today's state of Iran has used some of those old public administration traditions besides modern concepts of organization and management from around the world.

Iran with a specific nature as a developing country, generally, and as an Islamic republic, specially, attracts the interests of public administration experts from one side and political parties and policy makers from another side. Having different and specified political goals favorable to religious beliefs and traditional foundations make the governance system of this country so different. In Iran, like other countries, politics and administration are in challenge with each other. Politics' interest in control of administration and administration's interest in dominance over execution of public policies is an unavoidable affair in Iran.

Anyway the political orientation of public administration is a significant subject. This reality beside the importance of strategic situation of Iran needs to pay more attention to understanding the meaning and concept of politicization and its consequences for Iranian public administration. Unfortunately, the information about political decisions and appointments released in Iran is not enough and clear, so gathering data and ideas about this phenomenon is difficult. What is discussed here about politicization in Iran is the result of some available documents about appointments and suspensions, and interviews with informed experts.

## Politicization: The Result of Political Approach to Public Administration

Whenever a phenomenon becomes popular gradually in a social environment, scientists of that expert area begin to research about that. Politicization is one of those subjects discussed in political and public administrative environment. The politics-administration dichotomy has had a strange history in public administration, and many authors has focused on it (e.g., Cawley 2015; Demir and Nyhan 2008; Georgiou 2014; Overeem 2005; Svara 2001; Svara and Overeem 2006). This shows politicization is a common challenge for administrative systems in almost all countries. Therefore, it is quite obvious that the theoretical understanding of the phenomenon of bureaucratic politicization is of great importance – especially where consequences of policy-making are to be expected – for scholars of public administration, policy analysts, and practitioners alike (Bauer and Ege 2012, p. 407).

According to Cooper, governments turned their focus to controlling bureaucracy. By putting individuals who share a similar political orientation in key administrative positions, the power to appoint officials became a key means for governments to increase their command over bureaucracy (2015, p. 2). Also in this way, politicization of the public administration could be a weapon that executive power uses when doubting the ideological loyalty of the civil service (Dahlström and Niklasson 2013, p. 893).

The underlying rationale is that politicians will try to compensate their loss of formal power over regulatory matters by using informal channels of influence – such as the appointment of political allies (Ennser-Jedenastik 2015, p. 6). Despite theoretical and practical importance of this phenomenon, its meaning is still under discussion. So there are many different definitions of politicization but most researchers have considered politicization as "the substitution of political criteria for merit-based criteria in the selection, retention, promotion, rewards, and disciplining of members of the public service" (Peters and Pierre 2004, p. 2) (e.g., Cooper 2015; Dahlström and Niklasson 2013; Page and Wright 1999). This

definition shows politicization is recourse to partial and political criterions in public sectors' human resources management and makes political appointment. Political appointments can be viewed as an attractive strategy to ensure that the governing party's preferences keep influencing policy even after a power shift (Dahlström and Niklasson 2013, p. 894). Although this definition includes all kinds of countries (developing and developed countries) and political appointments are not avoidable, there is a difference. In developing countries, the purpose is just supply of jobs and positions for a group or tribe, but the purpose of politicization in developed countries is control over the execution of public policies.

The result of Imtiyaz's research in Sri Lanka was politicization were twofold: the erosion of the secular nature of the state and its institutions such as the legislature, bureaucracy, judicial system, public education system, and the police and defense forces; and the deepening distrust of marginalized minorities, particularly the Tamils both in the state and its institutions (2014, p. 326).

It should be mentioned that bureaucracy is born of politics because it is the manifestation of those systems and structures responsible for serving citizens, and this politics determines who serves what. So those policy makers, who want to be in power through control of bureaucracy, try to enhance its efficiency and justice in services, but it does not mean that they want to throw away the meritocracy from the heart of public administration.

Applying political criterions may influence the performance administrative system. If meritocratic criterions used for selection and promotion of employees, and political criterions just used for political managers in bureaucracies, its destructive influence on the performance of administrative system is fewer. Although about professional bureaucracies there should be professional carriers for managers.

At the end of this section and beside all mentioned about public administration and politics relation a challenge would be considered. When state comes to power democratically, there should be no doubt about all decisions on structures, appointments, and people. Is meritocracy as a criterion enough for selection, retention, and promotion administrators? Shouldn't public administrators be changed on the base of public will? Do political appointments distort bureaucracies in these cases? Is political approach to public administration required for confidence in agreeable execution of public policies? Therefore, we can note that politics-public administration dichotomy is a big challenge.

## Political System and Administrative Structure in Iran

There is a separation of powers on the base of the Constitution of the Islamic Republic of Iran, works under Supreme Leader's supervision; legislature, executive, and judicial system. Another two political organs in Iran are Guardian Council and Expediency Discernment Council of the System. Islamic Consultative Assembly has no legal status without the Guardian Council. Any bill passed by the Consultative Assembly must be reviewed and approved by the Guardian Council to become law. The Guardian Council holds veto power over all legislation approved by the Consultative Assembly. Expediency Discernment Council of the System is an administrative assembly appointed by the Supreme Leader, and its true power lies more in its advisory role to the Supreme Leader.

Legislation is the responsibility of Islamic Consultative Assembly and draws the overall policy, plans, programs, and budgets of country and passes laws. Consultative Assembly also supervises executive (government) as a control institution. Judicial system in Iran is on the base of Islam teachings. The head of the judiciary is appointed by the Supreme Leader. The Minister of Justice in government owes responsibility in all matters concerning the relationship between the judiciary and executive.

The executive is the organ that exercises authority in and holds responsibility for the governance of a state. The executive executes and enforces law. The head of the executive, President of Iran is the second government official after the Supreme leader. Eighteen cabinet ministers have

been proposed by president, and Islamic Consultative Assembly can reject or approve them. Also Consultative Assembly can question ministers about their performance and ministers should answer.

## Political Approach to Public Administration in Iran's Governance System

In some countries (e.g. Iran), based on political approach, by coming a new president the framework of government changes fundamentally. New president assigns new ministers; new ministers select new deputy ministers; new deputy ministers determine new general managers. Sometimes general managers change chairmen, employees, and even their secretaries. For example, Minister of Interior assigns new governors, and new governors assign new governor of a rural district. So all organizations even in the farthest villages see new managers. It is the beginning of politicization.

Taking politics away from bureaucracy seems impossible and irrational in Iran like other countries, so it seems necessary to notice some points about their relations. Descriptions and definitions about politicization look general and analysis of them seem necessary. Also looking at this phenomenon from national perspective could be one of the best ways to clear the meaning of that.

Almost all of public organizations have a degree of politicization in human resources area. Employees in public services with their different behaviors and decisions could make different degrees and various expressions of politicization. In Iran, like the United States, Germany, and France, this kind of politicization is common. Basically administrators and managers of public sectors are political people except for professional bureaucracies have no justification for politicians' entrance. Recognition of politicization is possible by some criterions. Fundamentally the nature of political criterions about politicization is various. Somebody point to partial political loyalties as political appointment criterions, but others mention the control of public policies as political appointment criterion.

From another aspect, some duties of some public organizations are inherently political, and forming boundary between their political tasks and executive roles is difficult. Now is it right to say these kinds of organizations or ministries are politicized? For example, the ministry of Information and Communication Technology (ICT) and the Ministry of Interior are the two important and strategic ministries in Iran that have the most political jobs.

Sometimes politicization occurs when a party comes to power after a long time by the imagination of public sectors' politicization and increased amount of opposite party's advocates in public organizations. In this case, new party may try to decrease politicization by their loyal advocate's entry. They may imagine this is a kind of meritocracy, but is it right in practice or their work could lead to a new type of politicization. This form is popular in Iran. Every party that comes to power tries to make an unpleasant image of the previous party and by exaggerating their mistakes and failures prepare the climate for their new decisions and new people. After the change of the president, new ministers change most of the managers, directors, and administrators. Documents and interviews show more than 70% of administrators at managerial and senior levels change with new winning party entrance to public sectors.

Also new organizations and companies, new structures, new services and goods, and new jobs for recruitment of new people are not surprising in Iran's public sectors through new government, for example, "Management and Planning Organization of Iran," one of the largest governmental establishments in Iran formed in 1999 from merging, "Plan and Budget Organization (PBO)," and "State Organization for Administrative and Employment Affairs," in the beginning of Mohammad Khatami's presidency. In 2007, in third year of Mahmoud Ahmadinejad presidency, he gave the verdict of its dissolution. Ahmadinejad formed Deputy Strategic Planning and Control and gave some parts of its duties to this new organization. In 2014, Hassan Rouhani president revived "Management and Planning organization" for the second time.

Making new rules and giving new licenses in different areas (political, social, cultural, economic, and other areas) are other instruments for politicians to control over bureaucracy. For example, in the duration of Ahmadinejad presidency, political parties and coalitions have been limited because of some problems and the most challenging subject was the House of Parties. In 2015 and by the coming of Rouhani with the political freedom slogan, the situation changed and the House of Parties that could not get the license in 2011 could work again.

## Consequences of Political Approach to Iran's Public Administration

Politicization, as explained, occurs with two different purposes: control over bureaucracy for confidence in right execution of public policy and finding jobs for advocates. In Iran as a developing country, appointing partial advocates to public jobs in senior levels is the main purpose of political interference in public administration.

Politicization is usually perceived as a negative concept and most of who studied this subject mentioned it as a phenomenon with destructive consequences (see Argyris 1986; Čehovin and Haček 2015; Cooper 2015; Senge 1990; Weiden 2011; Dahlstrom and Lapuente 2009; OECD 2004). Although politicization with the purpose of control over bureaucracy may have constructive consequences (Dekker and Hansen 2004; Mulgan 1998; Henig 2009; Imtiyaz 2014; Oyedeji 2016; Palonen 2003), expecting positive consequences from political approach to public administration in Iran would not be correct.

One of the consequences of political approach is spread of managerial bonus. It refers to special privilege political bureaucratic managers give to their loyal advocates in bureaucracy. They do it for the sustenance of their position and influence on system. This means use of national financial resources for individual goals like promotion of political position. Organizational flattery is another consequence of politicization. When the managers in public organizations judge on the base of their subjectivities and have competency nowhere in their judgments, every one try to make good relations with managers to influence that subjective image. So a culture of flattery forms in organizations that destruct ethics, humanity, and competency, and it could distort organizational performance. Increasing revenge expression is the other consequence that prevents people from criticizing each other or their supervisors and managers about their decisions and behaviors. It occurs when new managers try to suppress their opponents through human resource strategies (e.g., reward, punishment, and promotion). Organizational silence is the result of this climate. In such situations, employees and managers prefer to be silent instead of talking about their ideas, concerns, and wishes. Fear of managerial punishment permeates employees' heart and nobody can react to events and solve the problems creatively.

Increasing political behaviors of public servants; size of government, besides decreasing acceptability of administrative system; unskilled labor proliferation; and also destroyed meritocracy in public organizations are some other destructive consequences of politicization of public administration in Iran which are the most important consequences that have been extracted by existent literature.

## Conclusion

In almost all countries there is a degree of politicization even if they reject this claim and try to hide it. For example, a survival analysis in Denmark shows that since 1970 the risk that a top civil servant will be replaced has increased. There is no evidence of politicization in central government while city managers' risk of replacement increases when a new mayor is appointed, representing another party and holding an absolute majority, and when the shift of mayor takes place within the same party. They result in appointments which are politicized, that is, that party criteria have been substituted for merit when it comes to selecting top civil servants (Christensen et al. 2014).

With regard to what is explained about politicization of public administration in Iran and its

expressions and consequences, politicization of public administration exhibits itself more in political appointments and movements at the top levels in public sectors. Extensive amount of political decisions about selection, promotion, and movement of administrators in Iranian public sectors is a sign of important role of political approach in public administration. Although this form of politicization is difficult to prove because there is no clear and available information about them, but the facts and informal interviews can support this claim.

On the basis of Bauer and Ege (2012, p. 408) and Rouban (2012, pp. 380–390) typology, the conceptual side of politicization in Iran public administration is mainly formal or direct because it conceived of as the top-down ability of political superiors to decide about recruitment and promotion by considering nonmerit characteristics of officials. Also politicians try to apply professional politicization through to prepare a motion of censure against ministers.

Also Rouban (2012, pp. 380–391) proposed three dimensions of politicization that include: politicization as participation in political decision-making, politicization as partisan control over the bureaucracy, and politicization as political involvement. Our studies and existing documents show partisan control over the bureaucracy is popular and is the whole logic of the political system that developed in Iran in recent decades. Also all Western countries have created "political positions" to give the executive branch some means of control over public policy (Rouban 2012, p. 384).

As a conclusion, generally Iranian law allows political executives' strong influence on staffing decisions and personnel policy in public administration, so, for example, President have no veto power in Iran, and politicians can make any decisions related to cabinet members. Politicization is a popular phenomenon in Iran's public administration like most of other countries.

# Political Communication

Bryan T. Gervais
University of Texas at San Antonio, San Antonio, TX, USA

## Synonyms

Elite influence on public opinion; Political discourse; Political persuasion and mobilization

## Introduction

Political communication is the dissemination of political information among and between political elites, mass media organizations, and the public. The study of political communication emerged as an important subfield of both political science and communication in the twentieth century, with research focused on the influence of the news media on public opinion and voting behavior; the theories of agenda-setting, framing, and priming effects; the tactics and efficacy of political campaigns; the effects of negative political advertising; the discourse and deliberation among the mass public; the speeches and rhetoric of office holders; the interactive relationships between elite and mass opinion; the influence of commercial and political pressures on the content of news media; the relationship between partisan polarization and partisan media; and the advent of digital politics.

## The Minimal Effects Era

Coinciding with the growth of mass media in the early twentieth century was the debate over whether (an improved) news media could help to bring about an informed, active public (Dewey 1954/1927), or whether the public's reliance on media to understand the world left it susceptible to elite manipulation (such as propaganda and censorship) renders participatory democracy unworkable (Lippmann 1997/1922). Concerns over the gatekeeping power of mass media were accentuated by the rise of fascism. Scholars feared that mass media enables elites to "insert" opinions into the minds of the public on a mass scale, known as the "hypodermic needle" theory (Defleur and Ball-Rokeach 1982). However, scholars in the postwar era would find little evidence of a "hypodermic needle" effect – nor much evidence of media persuasion effects (Klapper 1948).

Seminal studies in what would become two of the dominate schools of thought in political behavior in the twentieth century found that vote choice in American presidential elections was determined by social and psychological factors. The sociological model, also known as the Columbia School, argues that group attachment (and the communication that occurs within groups) is largely responsible for vote choice (Berelson et al. 1954; Lazarsfeld et al. 1944). The social-psychological school, also known as the Michigan Model, names partisan identification as the primary driver of vote choices (Campbell et al. 1960). Notably, both models allow for vote choice to be made prior to the general election season, relegating campaigns to agents of reinforcement, rather than persuasion, with short-lived influence.

These findings led mid-twentieth-century scholars to largely conclude that the media's impact on public opinion was indirect and minimal and gave way to several influential limited effects theories, including the two-step flow

theory and reinforcement theory. The two-step flow theory posits that opinion leaders receive and are influenced by mediated messages and then disseminate and interpret the messages for others within their social circles (Katz 1957). Reinforcement theory, building off of Festinger's (1985) theory of cognitive dissonance, suggests that through selective processes – including selective exposure, selective perception, and selective retention – individuals can reinforce preexisting attitudes via mass media (Klapper 1960).

## Elite Influence

In the last decades of the twentieth century, researchers began rethinking "minimal effects" and demonstrated ways in which the media can directly shape public opinion – including agenda-setting, framing, and priming. The theory of agenda-setting purports that the problems that receive prominent attention in the news become the problems the viewing public regards as important (McCombs and Shaw 1972). Moreover, when the news media frames an issue by "select[ing] some aspects of [it] and make them more salient" (Entman 1993), it can influence how it is understood by audiences. The news media can also prime audiences to use specific issues as benchmarks when evaluating political leaders and institutions (Iyengar and Kinder 1989). Theories regarding the media's agenda-setting and framing powers are particularly prevalent in political communication research.

Contemporary scholarship acknowledges the influence of elite communication, with mass shifts in public opinion attributed to exposure to elite discourse (Zaller 1992). Studies assert that the American electorate has been growing more polarized, reflecting elite polarization, with the deepest divisions existing between the most politically interested and informed on either side of the political spectrum (Abramowitz and Saunders 2008; Layman and Carsey 2002). However, the extent to which the public has polarized (and if it has at all) is not universally accepted (Fiorina et al. 2010).

The influence of political and media elites is not limited to the mass public. For instance, the indexing hypothesis holds bracketed by political elites (Bennett 1990). Likewise, theories such as the "CNN Effect" assert that the news media can influence the decisions of political elites to intervene in humanitarian crises by displaying gruesome images which mobilizes support for action among the public – although this type of influence is an area of debate (Robinson 2005).

## Political Sophistication

Improved survey methodology in the mid-twentieth century revealed that few Americans have real opinions on issues and that political attitudes are not constrained or consistent, seemingly changing at random (Campbell et al. 1960; Converse 1964). Most "public opinion" only exists in the presence of a pollster, in which respondents sample from elite messages on "the top of the head," although politically knowledgeable individuals can filter out inconsistent messages (Zaller 1992). Despite the increases in access to electronic media and educational attainment among the general population, levels of political knowledge remained stable throughout the latter half of the twentieth century (Carpini and Keeter 1996).

Inattentiveness and low knowledge levels among the public to civic affairs are not worrisome to all. Scholars have argued that retrospective evaluations of government performance can be made with low levels of political information (Key 1966) – namely, a distinction between political parties – and the costs of acquiring of political information make it irrational to acquire high levels of political knowledge (Downs 1957; Fiorina 1981). The electorate utilizes heuristics (or information shortcuts) to make adequate vote decisions – most notably party cues (Popkin 1991; Sniderman et al. 1993), but also interest group endorsements (Lupia 1994). Moreover, scholars have argued that collective public opinion (opinion in aggregate) appears to be stable and shifts in ways that can be considered rational (Page and Shapiro 1992) and the American public may consist of a number of "issue publics" or groups of citizens concerned and knowledgeable about single issues (Krosnick 1990).

## Public Deliberation

While public opinion and behavior are influenced by elite behavior, communication within social networks can influence political decisions, as well (Huckfeldt and Sprague 2006). Moreover, proponents of public deliberation argue that citizens may learn from each other by sharing and discussion policy and electoral opinions (Luskin et al. 2002). As Warren (1996) explains, deliberation is a process, "wherein the point is to increase the quality of democratic judgments through widespread citizen participation in multiple public spheres, both within and between the institutions of state, economy, and civil society."

The idea that the public can collectively produce better public policy through deliberation dates back to Aristotle, who argued in *Politics* that regime quality is in part based on the extent to which policy is based on the quality of deliberation (Wilson 2011). Among the most influential adherents of public deliberation was Mill who proposed that "collating" the range of opinions in an unrestricted public sphere can produce the best possible collective outcomes (Mansbridge 1999). Contemporary theory has been strongly influenced by the work of Jürgen Habermas regarding the requisite normative conditions for discussions in the public sphere to be translated into legitimate public actions (Habermas 1990).

Modern political science research suggests that deliberation improves levels of political efficacy, political judgments, political sophistication, and levels of participation and, as a result, better public policy (Gastil 2000; Gutmann and Thompson 1996; Luskin et al. 2002). However, the exposure to crosscutting views among the public that deliberation provides may also result in a less vibrant, participatory citizenry (Mutz 2006).

## The Broadcast Era and New Media

The "Golden Age" of American broadcast news emerged as product of Progressive Era reforms and professionalization of journalism, coupled with the welcomed regulation of broadcast media by the Federal Communications Commission on behalf of the inchoate broadcasting industry looking to limit competition (Cook 2005). Broadcast news would supplant newspapers to become the dominate media regime in the twentieth century (Williams and Delli Carpini 2011). Professional journalists enjoyed a largely uncontested role as gatekeepers – i.e., determine what constituted news and what did not – with limited commercial pressure (Williams and Delli Carpini 2011). The rapid diffusion of television throughout American homes, coupled with limited choice in channels and programming audiences, resulted in incidental exposure to news among the "captive" audiences of the postwar era and a reduction in the political knowledge gap between the educated and uneducated (Prior 2007).

Throughout the broadcast era, scholars complained about lack of diversity in news; the big three broadcast networks (ABC, CBS, and NBC) offered homogenous, uniform, and bland news, and the public had few nonmainstream television news options (Mutz and Young 2011). Television more generally has been accused of negatively affecting voter turnout (and participation more broadly) by increasing political apathy and cynicism (Hart 1999) and reducing social capital (Putnam 2001)

Massive changes in the American media environment and advances in telecommunications technology toward the conclusion of the twentieth century ended the dominance of broadcast news in the era of "captive audiences." The widespread adoption of cable and satellite television enabled viewers to create their own media "diet," producing gaps in political knowledge and participation between those who prefer news and those who prefer entertainment (Prior 2007). Increased competition from entertainment programming also led television news to become "softer," in which distinctions between news and entertainment dulled and norms of social responsibility among media elites faded (Williams and Delli Carpini 2011). Soft news programming like talk shows, also known as "infotainment," has attracted significant audiences during the cable era, although scholars debate its civic usefulness (Baum 2002, 2003; Baumgartner and Morris 2006; Young 2004).

American news media has also been infused with partisan programming in recent decades. Increased competition and the fragmentation of once-large network news audiences into niche populations of news watchers have led media figures to be more overtly partisan and opinionated (Sobieraj and Berry 2011). Cable news programming provides around-the-clock coverage of current events and is noted for its practice of "narrowcasting" or creating content targeting a specific portion of the market (e.g., liberals or conservatives) (Cook 2005). Deregulation of broadcast media, such as the discontinuation of the "Fairness Doctrine," gave rise to political talk radio in the United States, freeing media personalities from having to give airtime to the targets of attacks to rebut charges (Barker 2002). These changes have produced self-protective ideological "echo chambers," including a vibrant conservative media establishment, that reinforce preexisting views and undermine the legitimacy of the opposition (Berry and Sobieraj 2013; Jamieson and Cappella 2009). The advent of the Internet has expanded the niche targeting of political information via websites (Baum and Groeling 2008.) In particular, the rise of the blogosphere has given way to "cyber-balkanization," in which blogs link to other like-minded blogs (Lawrence et al. 2010; Sunstein 2009).

## Selective Exposure and Media Bias

With the increase in partisan and ideological media has come a renewed focus on selective exposure and media bias. A robust debate has ensued regarding the occurrence and impact of partisan selective exposure, including a revival of media effects skepticism (Bennett and Iyengar 2008). Some scholars warn of the dangers of a citizenry selectively exposed to like-minded political media, arguing that partisan selective exposure occurs with consequences – i.e., it influences the opinions and behavior of those exposed (Dilliplane 2011; Hopkins and Ladd 2014; Iyengar and Hahn 2009; Smith and Searles 2014; Stroud 2011; Sunstein 2009) – whereas others argue that the political opinions of those who select into like-minded ideological media are little affected by exposure to opinions they already agree with (Arceneaux and Johnson 2013). Another subset of scholars have argued that partisan-based selective exposure is significantly more limited than many have feared (Gentzkow and Shapiro 2011; Garrett et al. 2013; Prior 2013).

The extent to which partisan media effects exist hinges in part on the extent to which do have biases and can be measured. One of the essential jobs of the news media is gatekeeping, or the "culling and crafting countless bits of information into the limited numbers of messages that reach people each day" (Shoemaker and Vos 2009). While the process of gatekeeping is necessarily a form of bias – some stories will be selected for presentation and others will not – measuring the extent to which the mediated news is unrepresentative of all the "news in the world" is likely an impossible task (D'Alessio and Allen 2000). Perceptions of media bias are widespread, perhaps due to what is known as the hostile media effect: partisans judge neutral news as biased against their own views or side (Eveland and Shah 2003; Giner-Sorolla and Chaiken 1994). In addition, the tendency of contemporary politicians to bash the media as "biased" may contribute to growing distrust of the news media among the American public (Ladd 2012).

## Political Advertising and Campaigning

Contemporary scholars have questioned the prevailing conventional wisdom (among political scientists) that campaign events and messages have little impact on vote decisions (Druckman 2004; Ridout and Franz 2011; Vavreck 2009; Sides and Vavreck 2013) – though stipulate that the conditions must be right for this to occur (Hillygus and Jackman 2003). Increased leverage of field experiments have also demonstrated the impact (and lack thereof) of specific types of campaign tactics, particularly face-to-face canvassing (Gerber and Green 2000; Green and Gerber 2008). Attention has also been given to emotional appeals in political advertisements, including

nonverbal elements (Brader 2006; Ridout and Searles 2011). Research has also focused on whether campaign messaging has become more potent and efficient due to the rise of micro-targeting and the personalization of political communication (Hersh 2015; Nielsen 2012).

## Negativity and Incivility in Political Media

The theory of videomalaise argues that Americans' trust in political institutions has declined since the 1960s, not due to the events of the time but due to Americans' reliance on "oppositional" television news (Robinson 1975). In addition to increased negativity, news media began presenting more game-centric and horse-race coverage during this period, and supplanted political parties as the principal "kingmakers" of presidential candidates (Patterson 1994). Largely due to inconsistent results, the impact (and merits) of negative advertisement is a continuing area of debate (Ansolabehere and Iyengar 1995; Geer 2006; Lau et al. 1999). However, a growing body of research has found that exposure to uncivil political discourse reduces trust in politicians, political parties, candidates, institutions, and the overall system of government (Brooks and Geer 2007; Fridkin and Kenney 2008; Mutz 2007, 2015; Mutz and Reeves 2005) and affects the ways in which individuals engage in political discourse (Gervais 2014).

## Rhetorical Presidency

The rhetorical presidency is a communication theory involving how the presidents communicate directly to the public (Ceaser et al. 1981). This is a distinct shift from old communication that usually involved the president focusing on Congress alone when trying to make policy (Tulis 1987). The rise of the rhetorical presidency is considered to be the result of modern doctrine of presidential leadership, modern mass media, and the modern presidential campaign (Ceaser et al. 1981). The motivations of the modern presidency are centered upon persuasion and the act of "going public"; in an effort to get Congress to pass legislation in line with the president's wishes, a president will attempt to mobilize the public (Kernell 2006). The end of the broadcast era and "captive audiences" may have muted the potency of the tool, as audiences can opt out of exposure to presidential speeches (and opponents now communication tools to combat the president's message) (Kernell 2006). Some scholarship raises doubts that public appeals were ever effective in influencing policymaking (Hart 1987).

## The Internet, Digital Democracy, and Social Media

The advent of the Internet age has invited scholars to consider the prospects of a pluralistic, digital public sphere (Dahlgren 2006; Dahlberg 2001), inclusive of a more diversified and democratized political discourse that would amplify the voices of traditionally underrepresented and underprivileged groups. The initial era of the Internet ("Web 1.0") did not meet this objective, in part because the so-called digital divide left many without substantial Internet access (Hindman 2008, p. 9, 22; Norris 2001). Disparities in "digital citizenship," or the ability to participate politically, economically, and socially online, have continued into the Web 2.0 era, mirroring offline citizenship (Mossberger et al. 2003, p. 35).

The Web 2.0 era, characterized by interactivity, may democratize information sharing and enable horizontal political communication. However, research casts doubt on the likelihood of a deliberative digital public sphere emerging, where ideas can be widely expressed and considered. For one, online information searches tend to be apolitical, and commercial media (as opposed to noncommercial outlets such as blogs) continues to dominate web traffic (Hindman 2008). In addition, the anonymity and limited social cues that digital communication provides perhaps entice "netizens" to utilize incivility more than they would discuss politics in person (Borah 2013; Coe et al. 2014; Papacharissi 2004).

Additional research on online political communication has focused on the relationship between online and offline political participation (Best and Krueger 2005; Bond et al. 2012; Shah et al. 2005; Zúñiga et al. 2010; Zuniga et al. 2012), microblogging and political homophily on social media (e.g., Barberá 2014; Bode et al. 2015; Colleoni et al. 2014; Larsson and Moe 2012), and use of websites and social media by elected officials and campaigns (Golbeck et al. 2010; Lassen and Brown 2011; Lawless 2012; Vergeer and Hermans 2013). Social media platforms have thus far enabled elected officials to broadcast information to the public without filtering it through a critical news media, rather than mechanisms for two-way communication between elites and the public (Hemphill et al. 2013).

## Conclusion

Both the study and application of political communication are changing at a rate equaled by few other fields. Improvements in telecommunications enable new methods of communication in and among elites and the public, providing ever more subjects for academic inquiry. For both the practitioner and the scholar, this means persistent vigilance of the latest information technology and literature on the subject.

What the erosion of the distinctions between news and entertainment and between suppliers and consumers of political information mean for democracy remains blurry. Horizontal communication (or widespread sharing of information among the mass public) may be here to stay, but this is by no means a guarantee of a more deliberative democracy. Instead, cognitive impulses to avoid and resist information which clashes with preexisting views may instead deepen partisan division when individuals are free to design their own information environments. Put another way, elite influence on public opinion may not lessen, as the influence of public officials on the hearts and minds of those who are predisposed to share their views may be increasing.

If the engaged public can select into media that matches preexisting views, what can be said about media effects? A second era of "minimal effects" studies seems unlikely – or at least consensus among academics that the media has little impact on opinion seems unlikely – but measuring the impact of media effects is no easy task. Widespread adoption of survey experiments on online platforms (Mutz 2011) and improvements in the measurement of media exposure (Prior 2009) may help in this regard, to the benefit of students of mass communication and those involved in electoral politics.

# Political Connections, Corruption, and Tax Practices

Hichem Khlif[1] and Ines Amara[2]
[1]Faculty of Economics and Management of Mahdia, University of Monastir, Monastir, Tunisia
[2]Faculty of Economics and Management of Sfax, University of Sfax, Sfax, Tunisia

## Synonyms

Tax aggressiveness: an aggressive form of tax avoidance or tax management.

Tax shelters: techniques used by taxpayers to decrease their taxable incomes (e.g., investing in exempt sectors or a tax haven).

P

## Definitions

***Political connections*** may take several forms including the presence at least of one politician (e.g., a member of parliament, a minister, a president, a king, and any other top appointed bureaucrat in the government), in firm's ownership structure, board of directors or audit committee.

***Corruption*** is defined as an act in which one agent typically pays a sum of money or performs a service in exchange for an illicit act by a public official (Picur and Riahi-Belkaoui 2006).

***Tax evasion*** is defined as the illegal practices to escape from taxation that can occur in an isolated incident within the activity or in the informal economy where the whole activity takes place in an informal manner (Picur and Riahi-Belkaoui 2006).

***Tax avoidance*** occurs when taxpayers use the legal scope for the discretion of tax laws running counter the purpose of tax legislation (Kim and Zhang 2016).

## Introduction

Tax evasion, political connections, and corruption are important current issues for governments worldwide. Understanding the effect political connections and corruption on aggressive tax practices have been gaining momentum in tax, accounting, and economic literatures (e.g., Alm et al. 2016; Kim and Zhang 2016; Lin et al. 2017). Accordingly, it becomes important to summarize this literature to help policymakers in quantifying the adverse effects of political connections and corruption on tax practices and implementing adequate fiscal strategies in order to reduce their damaging impacts on tax revenues collection.

To do so, this chapter surveys the recent literature examining the association between political ties, corruption, and tax compliance. Fifteen published empirical studies (Articles dealing with the link between political connectedness, corruption, and tax compliance are located by searching keywords e.g., political connections, corruption and tax avoidance, tax aggressiveness, tax evasion, tax enforcement in the most relevant social science research data bases such as Emerald, JSTOR, Science Direct, Springer, Wiley Blackwell.) are identified over the period of 2006 to beginning of 2018 conducted in developed, developing and emerging economies using either single-country analysis or cross-country investigation.

This literature review reveals that both political connections and corruption have an adverse effect on tax compliance. On the one hand, political connectedness is associated with increased tax aggressiveness in developed (e.g., USA), developing (e.g., China, Malaysia), and emerging economies (e.g., Tunisia) through lower effective tax rates, higher tax sheltering, increased tariff evasion, and reduced tax enforcement exerted by fiscal authorities. On the other hand, corruption level implies higher tax evasion levels, mitigates the negative effect of sustainability level on tax evasion, increases the positive effect of financial crime on tax noncompliance, and increases tariff evasion (e.g., tariff rates, values, and quantity gaps).

This review integrates and analyzes a broad spectrum of tax literature dealing with the impact of political connections and corruption on tax compliance. In light of increased global efforts to fight tax evasion and aggressive tax practices, an updated literature review with an international perspective is needed to inform the regulatory debate surrounding the enactment of new legislations that may reduce the adverse effect of political connections and corruption on tax compliance. This review is also relevant to academics interested in the determinants of tax compliance since it suggests areas where further research around political connection, corruption, and tax evasion is needed.

The rest of the chapter is organized as follows. Section "Political connections and tax practices" reviews the empirical literature examining the impact of political ties on different tax practices. Section "Corruption and tax practices" surveys empirical studies investigating the relationship between corruption and tax compliance. Section "Conclusion" concludes the chapter.

## Political Connections and Tax Practices

Political connections of taxpayers may adversely influence the state's revenue-generation efforts through direct impacts, via tax evasion or tax avoidance, and through indirect effect such as reducing voluntary tax compliance due to the destruction of tax morale of country's citizens (Kim and Zhang 2016; Lin et al. 2017). This discussion summarizes the extant empirical literature by focusing on developed, developing, and emerging economies.

### Developed Economies

Two empirical studies dealing with political connections and aggressive tax management conducted in US setting are identified. Kim and Zhang (2016) test for the association between

corporate political connections and tax aggressiveness. They document that politically connected firms are more tax aggressive than non-connected firms. Francis et al. (2016) refine the analysis by focusing on the association between CEO political connections preference in US setting (Republican CEOs versus Democratic CEOs) and tax sheltering, as an alternative proxy for tax aggressiveness. They provide evidence that Republican CEOs are associated with more corporate tax sheltering even when their wealth is not related to that of shareholders and when corporate governance is weak. They also show that Democratic CEOs are associated with more corporate tax sheltering only when they have stock-based incentives.

These findings confirm that politically connected firms may undertake more aggressive tax management since they have "*lower detection risk, better information regarding future changes in tax regulation or enforcement, lower capital market pressure for transparency, lower political costs associated with aggressive tax planning, and higher risk-taking tendencies*"(Kim and Zhang 2016, p. 79).

### Developing Economies

On the one hand, Adhikari et al. (2006) posit that political connectedness may give managers incentives to use their discretions in order to commit illegal behavior such as concealing taxable income or profit by deliberately overstating deductions, exemptions, or credits. Managers undertake these illegal acts since they know that they are protected from any type of future law suits given their strong political ties. From an empirical standpoint, Adhikari et al. (2006) investigate the relationship between effective tax rates and political connections in Malaysia and find that firms with political connections pay taxes at significantly lower effective rates than other firms. In the same setting, Abdul Wahab et al. (2017) investigate the relationship between political connections and corporate tax aggressiveness. Based on a sample of 2,538 firm-year observations over the period of 2000–2009, they find that politically connected firms are more tax aggressive than non-connected firms. In China, Li et al. (2016) use the occasion of increase in tax rate for several listed companies in the Chinese stock exchange and document that only politically connected firms undertake aggressive tax-induced earnings management.

On the other hand, political connections may constrain the effort played by tax authorities in the detection of fiscal infractions and the magnitude of postaudit adjustments and sanctions (Lin et al. 2017). The presence of a politician as major owner or a key actor in the management may reduce fiscal authorities' capability to enforce tax law and strictly punish committed fiscal frauds (Lin et al. 2017). In this regard, Lin et al. (2017) test whether political connections on boards of directors weaken the effectiveness of tax authorities in constraining aggressive tax practices in China. They document that political connections reduce the effective enforcement of tax compliance by State fiscal authorities. These results imply that political connections play an adverse effect on the enforcement of fiscal legislations and reduce the capability of State fiscal authorities to collect tax revenues.

### Emerging Economies

Rijkers et al. (2015) focus on the question of political connections and tariff evasion in an emerging country, namely, Tunisia. They use customs data dealing with imports realized by companies connected with 114 individuals, including Ben Ali himself and his relatives, when he was ruling Tunisia over the period (1987–beginning of 2011). They document that *(i)* Ben Ali-connected firms are more likely to falsely declare imports as being destined for re-exportation in order to benefit from duty exemptions and that *(ii)* evasion gaps are increasing with the share of importers that were politically connected. These findings suggest that trade facilitation through the rise of duty suspension regimes may increase custom duties tax evasion in emerging economies for politically connected firms.

Accordingly, relationship-based economies in emerging economies may create a favorable environment that contributes to the development of black economy size where the main operators feel protected from any future fiscal sanctions

given their strong relationships with politicians in the government. Black and unofficial economies will gain momentum in such emerging economies where customs and tax officials have a hidden protection of politicians when helping them to evade the payment of taxes and customs duties.

## Corruption and Tax Practices

Alm et al. (2016) suggest that corruption may reduce the value of public inspection. In countries characterized by high levels of corruption, it is difficult to reveal illegal acts committed by taxpayers using financial media. Furthermore, high corrupt environment may reduce public scrutiny and decrease the ability of fiscal administration to enforce tax legislations and punish taxpayers and their companies involved in aggressive tax practices. This implies a fertile ground for shadow activities and underground economy. This section surveys the extant empirical literature by focusing on cross-country studies and single setting empirical enquiries.

### Cross-Country Studies

Six studies dealing with the effect of corruption level on tax evasion are identified. For instance, Picur and Riahi-Belkaoui (2006) examine the effect of corruption level on tax evasion for a sample 30 developed and developing countries. They find that higher corruption levels is associated with higher levels of tax evasion. Alon and Hageman (2013) test for the association between corruption and firm tax compliance in transition economies. Using a sample of 5,000 firms from 22 former Soviet Bloc transition countries, they show that higher levels of corruption are associated with lower levels of tax compliance dealing with sales, work force, and wages. In the same vein, Alm et al. (2016) investigate how specific type of corruption (bribery of tax officials) affects firm's tax evasion practices for a sample of 8,000 observations from 32 different countries. They document that the presence of tax inspectors who demand bribes results in a reduction of sales reported for taxes between 4 and 10 percentage points and that larger bribes imply higher levels of evasion. Khlif et al. (2016) test for the moderating effect of corruption level on the association between sustainability level (Sustainability level is proxied by social, environmental scores and the quality of infrastructure) and tax evasion for a sample of 65 developed and developing countries. They provide evidence that the negative associations between sustainability proxies and tax evasion become insignificant for high corrupt countries. Worku et al. (2016) examine whether corruption level in sub-Saharan African (SSA) countries is associated with tariff evasion (e.g., tariff rates, values and quantity gaps). Using trade data from 2008 to 2014 of 31 SSA countries, they document that the interaction between *(i)* tariff rate, *(ii)* corruption in the importing country, and *(iii)* corruption in the exporting country is positively and significantly related to the trade gap. These findings imply that tariff evasion is reinforced by the corruption levels in both importing and exporting countries. Finally, Khlif and Amara (2018, forthcoming) investigate the association between financial crime and tax evasion and whether corruption level moderates such a relationship. Based a sample of 120 countries, they provide evidence that the level of financial crime is positively associated with tax evasion and this relationship is more pronounced for high corrupt environments.

Overall, it seems that corruption has an adverse effect on tax compliance behaviors. Countries characterized by high levels of corruption may create a fertile ground for tax noncompliance and illegal acts among their companies and taxpayers which translate into high levels of tax evasion. Accordingly, combating this phenomenon is crucial to improve tax revenues and enhance tax morale among taxpayers in one country.

### Single-Country Studies

Two studies examining the effect of corruption on tax compliance behavior conducted in an emerging economy and US setting are reviewed. In an emerging economy, namely, Jordan, Alasfour et al. (2016) use a questionnaire survey to examine how the extent of governmental corruption

may affect tax evasion practices. They document that the intention of surveyed taxpayers to commit tax evasion increases with the level of perceived corruption.

In US setting, DeBacker et al. (2015) examine the association between corruption norms overseas and tax evasion. More specifically, they test whether companies controlled by foreign investors resident in countries characterized by high corruption levels are more likely to evade US taxes. They find that corporations with owners from countries with higher corruption norms engage in higher amounts of tax evasion in the US setting.

In sum, the findings reported in these empirical studies suggest that the effort played by governments to reduce the extent of governmental corruption may increase tax compliance and enhance tax morale among citizens.

## Conclusion

This chapter summarizes the empirical literature dealing with the impact of corruption and political connections on tax compliance by reviewing published empirical studies over the period of 2006–beginning of 2018. This review suggests that relationship-based economies based either on political connections or corruption practices may increase the scope of back economy and tax evasion. Therefore, it becomes crucial for policy makers and fiscal authorities in emerging, developing, and developed economies to identify and quantify the impact of political ties and corruption practices on taxpaying behavior. By doing so, these countries may increase the revenue-generating opportunities and improve tax morale among citizens.

Future research may explore the effect of foreign political connections on tax evasion practices, tax avoidance, and tax aggressiveness at country and company levels, subject to the availability of reliable cross-country data. In addition, future empirical enquiries may examine the impact of different types of companies' political connections (e.g., opposition parties versus ruling parties in democratic regimes) on aggressive tax practices (e.g., tax evasion, tax aggressiveness) and compare between them. Finally, future research may also explore the possible interaction between corruption level and political connections in shaping tax evasion practices.

# Political Control or Professional Autonomy? A Case of Agency Director Resignation

Tom Christensen[1] and Per Lægreid[2]
[1]Political science, University of Oslo, Oslo, Norway
[2]University of Bergen, Bergen, Norway

## Synonyms

Freedom of experts; Hierarchical control; Political steering; Subordinate administrative leader

## Definitions

Political control is control by elected top leaders toward subordinate leaders and administrative units. Professional autonomy is freedom from interference of superior political leaders.

## Introduction

A classical theme in public administration research is the tension in the relationship between politics and administration, representing professional expertise. The autonomy of central public agencies has been a focus of many public organization research efforts showing that agencies may have a differentiated control and autonomy regime (Pollitt et al. 2004; Verhoest et al. 2012). The autonomy concept in public administration research is multifaceted, multidimensional, and ambiguous. Structural autonomy is the extent to which the agency is shielded from ministerial influence. Agencification tends to reduce political control, but within the principle of ministerial responsibility. In the aftermath of management reforms, there have been several prominent examples of resignation of agency heads (Polidano 1999).

This article aims at addressing the relationship between political control and professional autonomy by examining a reorganization process of Statistics Norway. The puzzle is why a minor reorganization with low political salience in a consensus-oriented political administrative setting with high level of trust between ministries and agencies ended up as a major conflict resulting in the resignation of the agency director. Based on an instrumental, a cultural, and a symbolic perspective, taken from organization theory, the article examines the internal and external dynamics ensuing from conflicting views regarding the balance between institutional logics.

The article starts by outlining the theoretical framework. This is followed by some context about the agency system in Norway. We then tell the story leading up to the director's resignation, tracing the two narratives. Finally, we analyze the findings based on the theoretical perspectives and formulate some conclusions and lessons.

## Theoretical Perspectives: Instruments, Culture, and Symbol

An *instrumental perspective* on reorganizations regards the political and administrative leadership as rather influential in public decision-making processes, scoring high on both political-administrative control and means-end thinking (Christensen et al. 2007). Leaders can either have hierarchical control or engage in negotiations and strike compromises (March and Olsen 1983). Applying an instrumental perspective would first be to analyze the actions and perceptions of the executive leadership in the ministry and the director related to the autonomy question. Second, was there a negotiation process going on

between the ministry and the director, leading the director to modify her proposals?

According to a *cultural perspective*, change processes tend to be rather slow and evolutionary, where informal norms and values are developed as a result of adapting to both internal and external pressure (Selznick 1957). The importance of path-dependency and cultural appropriateness implies that cultural norms and values of change efforts have to be compatible with historical traditions. First, we ask whether the director of the agency tried to break with the cultural path of the agency. Second, did the minister act in a culturally appropriate way toward the director and the agency?

From a *symbolic perspective*, reorganization processes will be seen as the social construction of reality, window-dressing, and symbols (Meyer and Rowan 1977). Often the actors use double-talk, meaning that they talk in one way and act in another (Brunsson 1989). Symbols are used to provide flexibility and to increase support and legitimacy, and their use is made easier by the existence of ambiguity in processes of change. Applying a symbolic perspective to our case raises questions about the main symbols the director and the minister used. Are there also signs of symbolic post-rationalization in their arguments related to the autonomy question?

## Contextual Features

There is a high level of mutual trust between ministries and central agencies in Norway. The degree of perceived autonomy of central agencies is higher and the degree of politicization is lower among top civil servants in Norway than in many other European countries (Greve et al. 2016). Norway has a long tradition of central agencies. A main governance doctrine has been that the ministries should be a secretariat for the political executive, while the agencies should have assignments that are more professional, implementing public policy and providing services, regulation, and surveillance. In recent decades an agencification process has been going on in which the agencies have become larger and more influential.

The central agencies are part of the central government administration and directly subordinate to the ministries but structurally disaggregated from the ministries. They are semi-autonomous organizations without legal independence but with some managerial and professional autonomy (Verhoest et al. 2012). The top executives in the central agencies are appointed by the government for a fixed term. Normally reorganization of central government is a prerogative for the government. Internal reorganizations in agencies are normally delegated to the agency.

Statistics Norway was established in 1876 and has over time had a strong professional autonomy. It is a large central agency subordinated to the Ministry of Finance, and it also has an executive board appointed by the government, but the board does not appoint the director. All directors have historically been trained as macro-economists. Most of them have had a long career within Statistics Norway, and there has also been frequent mobility between Statistics Norway and the Ministry of Finance. The appointment of a new director in 2015 was a break with this tradition. The director had a background as a professor in strategy and management and came from outside. Like several of the predecessors, she also had a political career. In contrast to her predecessors, her political career was not in the Labour Party but in the Conservative Party.

From 2013 to 2018 Norway had a minority coalition government formed by the Conservatives and the Progress Party. The leader of the Progress Party was the minister of finance.

## Main Events in the Reorganization Process

The timelines of the main events in the case are summed up in Table 1.

The process started in 2016 when Statistics Norway (SSB) appointed a committee headed by one of the research directors from SSB to discuss the future research strategy of the agency. It consisted of eight members, of whom five were professors of economics. The committee should evaluate the activities of the Research Division in

**Political Control or Professional Autonomy? A Case of Agency Director Resignation, Table 1** Timeline of the main events in the SSB case

| Time | Event |
|---|---|
| 2015 September | A new director of Statistics Norway is appointed |
| 2016 August | The Bye committee is appointed by SSB |
| September 9 | The ministry appoint a public commission on a new law of statistics |
| 2017 January 5 | The Bye committee submit its report proposing major changes in the Research Department, which are supported by the director |
| January 26 | Meeting between the ministry and SSB on the Bye report. Ministry expresses worries about securing the SSB's societal mission. Reiterated in a meeting on April 24 with the board and director |
| April 26 | Board meeting with the director. The board expresses reservations about the direction of the process |
| September 18, 19 | Meetings with the ministry and director on the reorganization, including the criteria for allocating researchers to the RD |
| October 23, 24 | Criteria and actual allocation of researchers revealed |
| October 30 | Meeting between the minister and director. Director announces that she will stop the reorganization until the next meeting |
| November 8 | Meeting between the minister and the director, between the administrative leadership and the director. A meeting scheduled for Nov. 10 did not happen because the director wanted to bring a lawyer with her |
| November 10 | The director gives a press conference attacking the minister, saying there is no reason to sack her and that SSB should not be dependent on the trust of the minister, but should be independent and not subject to political control. The minister gives a press conference, saying she does not trust the director |
| November 12 | Agreement between the director and the ministry that she should quit |
| November 14 | The first of many letters from the Scrutiny and Control Committee to the ministry about the reorganization |
| November 24 | The director writes a letter to the college of European directors of statistical agencies saying she had to go because of conflicts over immigration statistics |
| 2018<br>January 10<br>March 1, 20 | Two public hearings in the Control Committee and the final report from the committee including criticism of the minister from the majority of the Committee |
| March 19 | Report from the commission on a new law on statistics, clarifying and supporting political control |

terms of the strategic goals and the implications for the future organization of the RD.

In its report, the committee proposed a radical reorganization of the research unit (RD). The report concluded that current research was overall not of a high international standard. It proposed that the staff of the RD should be reduced from around 80 to between 25 and 35 researchers and constitute a "center of excellence." It proposed moving the researchers who did not fulfill international quality requirements to the statistical divisions.

The director embraced the committee's report, but the board was reluctant to accept the proposed changes, and so were allegedly also the ministry. But, the director continue to pursue and detailed the proposed change, spurring both internal and external resistance. In the late fall, the process became more intense, with several meetings between the director and the ministry, and it became more public with an intense debate between different views. Finally, the ministry put the process on hold and the director agreed to leave her position in November 2017 amidst strong conflicts over how to interpret the process. The process ended in 2018 by public hearings in the parliament's control committee followed by a general debate in the Parliament.

## Narrative 1: The View of the Agency's Director

Narrative 1, the one asserted by the director, was based on her contention that she had a clear

mandate from the ministry from day 1 to reorganize the agency, since there was a clear need for internal change at SSB. The director also claimed to have the support of the internal employees in her effort to rapidly bring about change. However, when she heard that the ministry was skeptical about the changes, she modified her proposal concerning staff reductions in the RD.

In a rather dramatic and symbol-ridden end to her narrative, the director claimed that her forced resignation was a democratic problem and that the professional independence of the agency was at the heart of the matter. She also thought that the minister had departed from the normal rules when the minister said publically that she did not trust the director, which made her position untenable. She claimed that moving a researcher doing immigration statistics also was behind her demise.

### Narrative 2: The Ministerial View

This narrative was the one espoused by the minister of finance after the conflict erupted, shown in both the open hearings and in numerous letters to the Parliament. It conceded that modernization of SSB was necessary but that the ministry had been worried about the direction of the reorganization. The minister was worried related to the "societal mission" of SSB. The minister asserted that this concern had been expressed over a long period of time in a "steering dialogue."

The minister also denied that the lack of trust in the director had anything to do with her "liberal" views on immigration. It was also argued that the ministry had only used its superior position, because reorganization was of great political significance, and that the case had nothing to do either with violating democratic rights or with limiting the professional autonomy of the agency.

The leadership of the board sided with the minister and said that it had warned the director, but did not communicate this to the ministry. The representatives from the unions at SSB said that they were not much included in the process, were skeptical about the report's attack on traditional macro-economic models, and disagreed with criteria for selection of personnel in the new RD. The national organizations for employers and employees, also sided with narrative 2, because they were warried about the "societal mission" of the agency. A Statistical Law Commission delivering its report in 2018 also agreed with narrative 2 through proposing more control measures from the ministry.

The report from the parliament's control committee had a majority from the opposition parties and a minority consisting of the two parties forming the cabinet. The majority mainly supported narrative 1, while the minority supported narrative 2. In the final vote in the parliament, the view of the majority in the control committee was supported. At that point in time, the political drama of the case had evaporated and the vote had no political consequences for the minister.

## Discussion: The Theoretical Perspectives Revisited

Seen from the *instrumental* perspective, this is a case related to a conflict over the balance between central political-administrative control by the ministry and professional autonomy of the agency. The minister was worried that political steering, defined as related to the agency's "societal mission," would be undermined by the reorganization of the RD at SSB, i.e., the minister had to interfere because it had wider political implications. Seen from the director, the central goal of the reorganization effort was to improve the ability of the agency to deliver good professional quality to the ministry, so the minister and director perceived the potential effects of the reorganization quite different. The director argued that she had the mandate and support from the ministry to enact the reorganization. But, the ministry's concerns were not very clearly expressed, and the director was not very open to stopping the process. The process also had some negotiation features. The main veto player was the minister, supported by internal and external allies, who late in the process had the authority to stop the process.

From a *cultural perspective*, the conflicts in the process represented a potential break with a cultural path for the agency. The director and her

allies supported a structural renewal of the agency and its professional models, i.e., breaking the traditional path. They opened the window-of-opportunity to changing the agency. Their actions seem to be a result of institutional "drift," meaning that they thought that it had not kept up with external changes and therefore needed substantial changes in profile and models (Mahoney and Thelen 2010).

One might further question whether it was appropriate for the minister to say, late in the process, that she did not trust the director to adhere to the agency's societal mission in reorganizing the RD, which is what eventually led to the director's resignation. This is a rather unusual thing for a minister to say, but it was within her steering rights.

According to the *symbolic perspective*, ambiguity in communication and interaction led to a more intense use of symbols. The director of the agency played a general "victim card," which consisted of several symbols related to institutional autonomy and democratic considerations. A combined modernity and quality symbol was played out with respect to the Bye committee. Both leaders in the agency and some economics professors emphasized that the research at the RD was old-fashioned in terms of the models used and of low quality.

The minister primarily used a symbol related to the "societal mission" of the agency, which is very potent in a system of peaceful coexistence and with a focus on collective values.

## Conclusion

Five main general lessons can be drawn from this case. First, the logic of action based on consequentiality and the rather clear rules for balancing political control and autonomy could be problematic in conflict situations with ambiguity in communication and interaction (March and Olsen 1989). Second, modern agency leaders, believing in managerial autonomy, may end up being strongly controlled by the political leadership, resulting from a process of politicization (cf. Maor 1999). The director failed to build internal and external alliances and compromises.

Third, change is also about path-dependency, cultural appropriateness, and veto players (Tsebelis 2002). In the end the agency leader did not pass the cultural "compatibility test" and had to resign due to a change process that conflicted with the institutional tradition and culture.

Fourth, the politics of change in public organizations is also about meaning-making and symbols of tradition and modernity (cf. Meyer and Rowan 1977). The "victim-oriented" symbols of the director clashed with the control and stability symbols used by the minister. Finally, the case illustrates the paradox that despite the loss of authority of expert knowledge, the experts do not adapt their ideas of knowledge and its relation to politics, and the political executives do not abandon their reliance on existing advisory arrangements.

## Political Corruption

Doron Navot
The University of Haifa, Haifa, Israel

### Synonyms

Abuse of power; Bribery; Graft; Immorality

### Definition

The misuse of public power for private interest.

### Introduction: Agreements and Disagreements About Political Corruption

*Corruption* is an evocative and pejorative term that is used in political contexts to express rage, disappointment and usually also a call for a change. Political corruption, which refers to abuse of public power, is one of the most discussed issues all over the world since the end of the cold war. The prominence role of corruption during the year 2015 and the first months of 2016 can demonstrate this point. For example, in the United States of America, the most established democracy in the world, the candidates' talk about corruption in American politics was one of the reasons for the popularity of the candidate for the Republican nomination for President of the United States in the 2016 election, Donald Trump, or of the candidate for the Democratic nomination for President of Berny Sanders. The leader of the Popular Party in the Madrid region resigned amid investigations of corruption within Spain's governing party. Near to deadline of submitting this entry, Israel's former Prime Minister Ehud Olmert went to prison for 19 months for taking bribe and obstruction of justice, becoming the first ex-premier in Israel – and probably in other contemporary democracies as well – to be imprisoned. Fifa, football's world governing body, has been immersed by widespread corruption. In Brazil, the president was facing impeachment proceedings and many in Congress facing criminal or corruption charges on the first months of 2016, just before this entry was submitted.

Naturally, side by side with the accusations of corruption and systemic problems of misuse of public power, anti-corruption activities and policies have gained a prominent place on the global agenda and in national politics. In addition, there are also civic protests against corruption in government, whether in well-established democracies or in developing ones. Furthermore, a composite of activities carried out by governments, intergovernmental organizations, NGOs, etc., which take the form of tools, measures, campaigns and integrity programs, developed into a distinguished "anti-corruption discourse." Some scholars have described these developments as the corruption eruption, alluding to the possibility that there is more heat than light in the way we study political corruption and attempts to reduce it. Others talk about "anti-corruption industry," alluding to the possibility that the struggle against corruption is not as pure as its agents like people to believe and that its existence is independent or unrelated to the most important problems of misuse of public power in contemporary regimes. It might actually contribute to corruption (Sampson 2010).

While scholars underscore that there are disagreements over the most basic questions of political corruption, as a matter of fact, there is also a wide consensus about important issues. For example, today many scholars are willing to admit that anti-corruption has become an issue of its own and that too many anti-corruption "strategies" did not meet their goals or simply did not make politics and government better. Scholars also agree that corruption means a great deal more than bribery

and that acts of corruption are usually symptoms of a deeper problem in the relationship between state and society. Similarly, scholars assert that there are disputes about the definition of political corruption, but at the same time, that the most common definition of political corruption is misuse of public power for private gain. More fundamentally, there is a tacit acknowledgment that misuse of public power for private gain is an important and problematic phenomenon, which deserves attention of scholars, practitioners, journalists, and ordinary citizens. Likewise, scholars are not satisfied with the measurement of political corruption, and yet, most of them would not entirely dismiss the use of perceptions indexes. Finally, there is almost a consensus today that while it is of utmost importance to combat political and reduce public corruption, there are only few success of anti-corruption endeavors.

Taking this partial consensus as a point of departure, this entry addresses several issues with regard to political corruption. The next section focuses on the question what is the function of the concept of political corruption and discusses the meaning of the term. The section that follows discusses explanations for the causes of corruption, distinguishing between public choice approach, sociological approach, and more historical-institutional approach. Next, the article looks at the consequences of corruption, while the section that follows concisely surveys methodological issues. Before concluding the article examines anti-corruption measures and attempts to curb corruption. The final part discusses new directions in the field and suggests what we can expect from anti-corruption.

## The Concept of Political Corruption and Its Functions

One of the important issues in any conceptual discussion is why the discussion exists in the first place. What kinds of problems and misunderstandings are driving it? What is the purpose in reexamining a given concept, and what will a reconceptualization achieve? These basic questions are neglected from the field, but they are important if any progress is to be made about questions such as what is the nature of political corruption and what is its definition.

The term corruption has strong negative connotations, and the notion of political corruption revolves around the misuse of public power. By definition, political corruption takes place within the public sphere or at the interface between the public and private spheres, by agents with power (Heywood 1997). Most scholars will add the notion of private or personal interest and conceive of political corruption as the misuse of entrusted power for private interest (Andersson and Heywood 2009; Philp 2015).

Generally speaking, the conceptualization of corruption is an attempt to clarify what distinguishes between the *use* and *misuse* of public power, and what kinds of goals are to be considered private. The issues that raise the most complicated and acute questions were those that relate to pervasive abuses of power and of systemic attempts by politicians to gain or preserve public power by misusing their public office. This is because political interactions necessarily involves exchanges: efforts to influence behavior by promising some kind of electoral support (money for campaigns, organization, voting, etc.) in return for governmental service, a policy, legislation, etc.

While illegality was central to definitions of political corruption in the past, and some scholars still prefer to refer legal norms, there is no justification to confine political corruption for illegal actions, and such an approach would be too conservative. Simply put, politicians determine what is legal and what is not, and confining the definition to illegality means that the definition is subordinated to the will and the interests of politicians. That would not allow to include situations and practices that the political elite want to legitimize and have the power to do so, even if they are harmful. Inasmuch as the meaning of corruption has narrowed to illegal behavior and quid pro quo that narrowing has provided not only partial content but it also provided biased content.

In addition to these general concerns, there are more specific reasons to discuss the meaning of political corruption in contemporary democracies and in the developing world. First, over recent

years the term corruption has seen intensive use in the public discourse. It is important to understand this discursive phenomenon, if political life is not to become intolerable and overly rigid. Similarly, scholars must critically examine the notion of corruption as part of a larger attempt to develop sensitivity to the circumstances of politics and in order to develop a political language that is normative but not moralistic (Philp 2015).

Second, the conceptualization of corruption is driven by juridical concerns, especially in countries where the legislature or the Court have held that limits on issues like campaign contributions, lobbying, and other democratic practices are justified by the government's interest in preventing corruption and the appearance of corruption. Third and finally, the conceptual work is required because of the dramatic increase in the power of the business community and the amount of money spent on electoral campaigns over the last four decades in many countries, and the concomitant massive increase in the power of economic elites.

In the end, any conceptualization of political corruption in liberal democracies and even in developing countries that are less than democratic must meet three challenges. First, the conceptualization should improve political judgment by helping develop sensitivity to problematic power relations. Second, it should provide guidelines for public behavior, offer prescriptions for institutional reform if necessary, and help identify agents of change – whether they are in the government or outside of it. Third, the conceptualization should retain core elements of the general concept of corruption.

## The Causes of Political Corruption

One of the features of the literature on corruption in the last century has been the attempt to explain corruption in rational terms in a field that, until the end of the nineteenth century, was dominated by moralists and moral explanations. More specifically, from the early days of modern political science there is a sincere attempt to explain why even decent people may be engages in corrupt practices, and how macro factors like industrialization, urbanization, and immigration are related to the development of massive graft, bribery, and party machine in developed democracies. That is not to say that the literature tolerates corruption or that it exonerate individuals. Rather, it means that the root cause of corruption often goes beyond few rotten apples. The problem is often in the box of apples itself, and if we want to explain why a certain person was engaged in abuse of power, we better take a look also in other factors that go beyond personal failures, bad character of agents, and wickedness of the heart (Navot 2014).

One of the questions that the literature deals with intensively is why some countries are more prone than others to political corruption (Heywood 1997; Persson et al. 2013). There is strong evident that lower perceived corruption correlates closely with higher economic development (Treisman 2007) or that liberal and democratic regimes suffer less from flagrant abuses of power such as extortion, quid pro quad bribery, and nepotism (Johnston 2014). The literature also tells that trust is both cause and effect of corruption. But naturally for the material, what exactly causes corruption, or what are the mechanisms that connect between economic and political factors and political corruption, are disputable issues.

One prominence explanation of corruption adopts economic perspective. Scholars who adopted it tend to use the principal-agent model in order to explain when corruption is more likely to occur. Corruption is modeled as illegal behavior of agents that are motivated by desire to reelect (in the case of politicians), budgets (in the case of bureaucrats), or greed (in the case of both politicians and bureaucrats), entrusted to act on the behalf of principal – the public.

The fundamental cause for corruption on the macrolevel according to this approach is governmental intervention in the economy (Acemoglu and Verdier 2000). More specifically, it is the regulatory functions of the state, rather than the productive or redistributive functions that is associated with corruption (Holcombe and Boudreaux 2015). That way or another, the economic approach believes that what cause political corruption at the individual or microlevel is the fact

that it is more rational to deviate from a rule for private gain. Likewise, this approach suggests that the regular democratic tools – elections, free press, transparency, etc. – are usually deficient against collusions between interest groups, greedy politicians, and ambitious bureaucrats. The extent of corruption in this model hinges on four factors: (1) the value of the state service for a citizen; (2) the value of the corrupt offer that the citizen provide for the decision maker, as a function of the citizen's economic capacities and interests; (3) the probability of being detected when engaging in corrupt interaction, as a function of the enforcement system; and finally (4) the punishment that the system would impose on the corrupt agents if they be detected (Banfield 1975; Rose-Ackerman 1978).

Some scholars that developed this approach assume that elected politicians and bureaucrats are the root cause of corruption. Therefore, they recommend on less government. That is, privatization, deregulation, and shirking the state can reduce corruption dramatically (Becker 1998). However, other scholars who adopted the economic perspective have less faith in the market, and they believe that the state should play a major role also in economic life. They do not support shirking the state or measures such as deregulation and privatization. Rather, according to the economic approach, the best way to cure political corruption is by changing incentives of agents – whether by increasing transparency and control or by increasing the punishment – and enhancing their ethics (Rose-Ackerman 1978).

In contrast to the economic approach, the cultural-sociological approach stresses the degree to which corrupt behavior such as paying money for public service or appointing relatives for public office is bounded by native norms, local distinctions between public and private, and shared interpretations of right and wrong in politics. From this perspective, societies encourage agents to act in ways that are honest or corrupt. The Israeli bureaucrat who receives a gift after providing a complicated service, the American politician who receives a big donation and does favors for his donors, or the French mayor who receives envelopes with cash money routinely are deeply embedded in a domain composed of habits, conventions, and norms which provide schemes of interpretations, of both what is the agent's motivations, what is right and wrong, and what he is allowed to do. Not only do societies provide information about the expectations from the agents, they also affect their desires, motivations, and preferences.

Scholars who adopt the sociological-cultural approach usually define private interests much more broadly than financial gain. Such a definition problematizes the distinction between private and public interest and shows that the boundaries between political corruption and mundane politics is dynamic and complicated. In addition, sociologists, anthropologists, and scholars who adopt this approach tend to underscore how the interpretations of agents are different from the outside observer. Thus, many scholars are reluctant to blame agents for being engage in political corruption. Finally, this perspective is sensitive to the anti-corruption discourse and how it contributes to the construction of the meaning of political corruption. It does not mean that anthropologists and sociologists are relativists or tolerant to abuse of power for private gain. However, they emphasize that observers from the outside, and what an agent will see as legitimate behavior or a corrupt one, is to a large extent itself socially constituted.

The historical-institutional perspective to political corruption combines insights from the economic and sociological-cultural approaches. While it does not provide precise answers to the question what motivates an agent to engage in corruption or what makes a country more prone to corruption than other one, this approach still offers an important and unique view on the subject. The uniqueness lies in sensitivity to power relations and conflicts among groups and in giving more room to ideas and agency in explaining why political corruption occurs. According to this approach, corruption takes place when the benefits related to being corrupt are often considerably greater than the costs. This is similar to the economic approach; however, and in differing with the latter, the historical-institutional perspective stresses that there are discrepancies across groups. The higher a group in the hierarchy, the more

likely it is that it would benefit from engaging in corruption (Persson et al. 2013, 460–461).

This perspective is also distinguishable in the role it ascribes to the state. The state and the bureaucratic apparatuses are not only causes of political corruption but also a cure for it. From this perspective, systemic corruption is deeply rooted in a state's underlying social and historical-political structure, and historical conditions ranging from institutions to natural resources can have long-term effects on political corruption (Uslaner and Rothstein 2016).

For scholars who adopted this approach, a major question is how corruption became entrenched, endemic, and pervasive, that is, the acceptable way of governing. A related insight in this literature is that it is not enough to explain that corruption is not in the interest of politicians, bureaucrats, and the people but also to solve coordination problem or collective action problems (Warner 2007; Rothstein 2011). Basically, the answer for such a question in this approach is a combination of history and institutions, a strong focus on the development of institutions of the state, and patterns of participation (Johnston 2014). For example, one study shows that the employment terms of public employees and the extent to which they are dependent on politicians are essential for understanding why some states suffer from systemic corruption (Dahlström et al. 2012).

## The Consequences of Political Corruption

One of the insights of the literature in the past three decades is that political corruption combines many types and practices, and thus, there are many consequences for corrupt acts (Johnston 2014). Likewise, context matters. While under specific consequences, certain corrupt acts may be beneficial for the common good – it may be more beneficial to pay a bribe for a lazy or a corrupt politician that would not advance a project that increases welfare otherwise – in general, it is obvious that corruption is not only immoral, and that corrupt acts are wrongful (and often blameworthy as well), but also that corruption is a harmful phenomenon. As a matter of fact, even philosophers and scholars that pointed out that corruption may be the lesser evil (from David Hume, through Alexander Hamilton to Walter Lippmann, Robert K. Merton and Samuel Huntington in the twentieth century) did not doubt that it is better to act in decent and honest way. Simply put, the question is not whether corruption is good or bad, but rather, whether it is possible to reduce corruption without causing more harm than good (Johnston 2014).

That way or another, as long as political corruption is discussed in general terms, the consequences of it can be enormous and deadly. There is plenty of evidence that corrupt rulers cause a lot of suffering for their people and that corrupt institutions and bureaucracies are one of the major reasons that poor countries are poor. It means that corruption causes death, hunger, waste of resources, and other human suffering (Rothstein 2011). High levels of corruption and exposure to corruption are a major problem for development worldwide, creating slower economic growth as well as poor social consequences. It breeds mistrust among people, mistrust in politics and government, and reduces trust (Seligson 2002). On the other hand, in countries with low corruption there is more human well-being than corrupt ones.

The consequences of corruption are far reaching even in developed democracies. Simply put, misuse of public for private gain also corrupt democratic processes and exclude people. It increases political inequality and make democracy mainly a façade (Warren 2004). Corruption in democracies breeds mistrust in government, causes anger, and discourages people to take part in the political process (Thompson 1995). More fundamentally, when institutions are systematically dependent on forces that are not the people, such as big donors or the business class, the government does not serve the people (Issacharoff 2010; Lessig 2011). This is massive problem on its own, and it can lead the desire for "strong leaders" who are "not corrupt" even if they breed racism, hatred, and illiberal ethos.

## Methodological Issues

Assuming that the conceptual challenge was solved and the definition of corruption is agreed upon, one of the problems with the study of corruption is the ability to measure misuse of public power, especially if it is delimited for misuse of public power for private gain. Corruption entails illegitimate activities, which participants want to hide. The clandestine nature of corruption makes it difficult to detect. Often corruption does not leave tracks – unlike murder there is no dead body or a missing person that someone is looking for – and at times it is not even clear whether or not corruption exists. Similarly, it is hard to tell what motivate agents to act the way they do. It is hard to judge whether the power holder has found the balance between different kinds of considerations in making decisions. The problem is not merely epistemological, one that could be overcome if the observer could only see more deeply into the minds of politicians and bureaucrats. The difficulty is built into the nature of politics – the nature of acting in the public sphere, whether in democracies (Thompson 1995) or other regimes. That means that is it often impossible to measure corruption directly.

The main response to this difficult in the last quarter century has been to rely on the perceptions, evaluations, and assessments of experts and ordinary citizens. That is, corruption measures are often based on the willingness of respondents either to share information about their own experience or their observations about corruption. The most prominent measure is Corruption Perception Index (CPI) constructed by Transparency International (Andersson and Heywood 2009), which make use of cross-national business people, experts and analysts' perception indices to rank countries, and aggregate information from a number of sources that include country risk ratings produced by business consultancies, surveys of international or domestic business people, and polls of country inhabitants. The CPI seeks to measure the overall extent of corruption in the public or political sectors. Another method was inspired by crime-victimization surveys. Corruption is measured by asking respondent about direct personal experience with it and questions recording their experience with corruption immediately prior to the survey. TI's Global Corruption Report and the Bribe Payers' Index are a case in point (Seligson 2006). The latter is not based on perceptions but rather on respondent's willingness to share information about their experience with the public sector.

In a sample of European states, the perceptions of how much one's public sector is corrupt were highly consistent when comparing samples of those who have and those who have not recently experienced public-sector corruption. Perceptions of citizens in Europe are highly correlated with expert perceptions. Simply put, a consistency of corruption perceptions between experts and citizens, as well as actual reported citizen experiences was found, and there is external validity for citizen-based perception measures (Charonn 2016).

However, whether the measure is based on experts or on ordinary citizens is also suffers from shortcomings. First, it is doubtful to what extent such perceptions and experience surveys measure misuse of power for private gain, and not other issues – such as disappointment from government, neoliberal, or anti-political sentiments. Although the surveys often ask a panel of experts to rank corruption on a scale of low to high, it is not known whether the experts share a common assessment of what constitutes any particular location on such a scale. Indeed, there is a high degree of correlation between the various indices, but that is partly because the surveys ask similar questions to people in similar positions (business people), and many of them are focused on bribery (Andersson and Heywood 2009). The second problem is that ordinary people, businessmen, and most if not all the analysts are not exposed to grand corruption, which is of great importance for the study of political corruption.

Ironically, the limitations of corruption perceptions indexes might be more crucial in indexes that are based on business people and analysts. First, the latter usually have less experience with every day corruption, or petit corruption, with compare to ordinary people. Business men usually have experience only in specific segments of

the government – according to their occupation and contacts. Second, business people usually have different world views from ordinary people, and this is especially true when it comes to very rich people. To conclude, TI has contributed to a significant research on corruption but also to the development of anti-corruption measures, which is the topic of the next section.

## Corruption, Anti-corruption, and Anti-anti-corruption

Struggling against corruption has emerged as a priority in many countries, and since the end of the 1980s, there is a tendency to adopt measures that are declared to be against corruption. These measures include declarations or statements about the need to curb corruption, signing of agreements and conventions, and efforts to enforce these commitments/agreements by governmental and non-governmental actors that are specialized in this field (Sampson 2010).

One of the insights of the literature, which is supported also by empirical research, is that democracy reduces corruption. A recent research discovered that the effect is considerably larger than suggested in the literature. Democracy, then, is important in combating corruption which means that democratization should be part of strategies to reduce corruption (Kolstad and Wiig 2015).

However, after a quarter-century long reform efforts to reduce political corruption, there is almost a consensus that anti-corruption activities that had been funded by international organizations are more often than not ineffective. Even in developed countries, there are anti-corruption rules that are not enforced, and many institutions do not have sufficient resources and discretion to enforce them. It is rare to find genuine will among power holders to eliminate corruption, and as a result, the declared intentions are not actualized. Scholars assert that the problem goes deeper than lack of will. According to them, most of the anti-corruption measures are based on misguided assumptions and on improper action items (Johnston 2014; Persson et al. 2013). Others conceive anti-corruption as apolitical and neoliberal-inspired solutions, which are part and parcel of political repression and abuse. At least in Tunisia, anti-corruption global discourse is a way to put forward neoliberal rationality, and it has been biased in favor of the needs of foreign investors (Baumann 2016).

Indeed, anti-corruption strategies may have many limitations, and they usually do not make government and politics free from misuse of public power. But at least in certain countries, they also make a positive difference. Thanks to the anti-corruption discourse; decisions makers; transnational corporations; business communities; lobbyists; courts and candidates act against quid pro quo, bribe-taking, and extortion; and flagrant abuses of power are probably less common. That is, while anti-corruption programs are at times consistent with the interests of bureaucracies and the private sector, they are also beneficial for the majority of the people. Simply put, the "anti-anti-corruption" sentiment, which seems to become fashionable in the last decade among political theorists, is much more problematic than anti-corruption per se.

Similarly, a closer look at responses to corruption shows that they have not simply been shaped by the anti-corruption global discourse or "anti-corruption industry." Rather they have been shaped by social entrepreneurs and the capacities and resources of local agents (Navot and Cohen 2015). Put differently, the global anti-corruption industry offered activists a tool they could use to put forward and legitimize their own concerns about political corruption (Walton 2016). So, while there are good reasons to be skeptical about anti-corruption measures that overlooks social forces and political institutions, it is no less important to not to overestimate the power of the global discourse.

Against this background, one of the lessons from the failed anti-corruption strategies that were adopted in the 1990s is not to conceptualize systemic corruption as a principal–agent problem, but rather to conceive it primarily as a collective action problem. Based on the case of Sweden who made a dramatic improvement during the nineteenth century, scholars who are interested in

reducing entrenched and systemic corruption stress the importance of three factors: improvements in the legal system; recognition of the problem by the main political actors; and liberal ideology (Rothstein and Teorell 2015).

## Conclusion

Over the past quarter century, political corruption has become an important issue and a central research topic in the social sciences. After a period in which political corruption was confined to illegal behavior and the focus was on the question of why individuals decide to engage in corrupt behavior, the emphasis of recent works have shifted to the analysis curbing systemic and entrenched corruption.

Supporters of anti-corruption activities and policies have tried to recruit influential players to reduce political corruption. They have been especially keen to attract people identified with an ideology that supports values such as transparency, integrity, responsibility, and accountability. Nevertheless, the experience and empirical research over the last two decades reveal that transparency and administrative measures are not sufficient to fight corruption, especially given the high costs associated with such efforts. In order to establish an environment of value-based public policy, it may be necessary to combine it with an understanding of the needs and motivations of potential anti-corruption agents and to adopt a more political approach – an approach that takes power and social relation much more seriously. Why there are no agents aimed at reducing corruption in some areas, while in other areas such efforts are successful? This question can be resolved by the realization that political intervention is conditioned by cost–benefit calculations and power relations. Thus, when agents decide to take action against political corruption, they must believe that it has a good chance of success and that the benefits outweigh the risks and costs or they must be desperate to such an extent that they would act against corruption even if the chances to succeed seem to be very low.

The historical institutional literature, which is more political in nature, has the potential to accommodate and improve accounts of political corruption based on principal-agent model, economic, and legalistic approaches. First, it suggests how fundamental change might take place, without becoming too naïve about such a possibility or glossing over the problematic of such a change. Second, it has the potential to leave room for the role of agency in curbing political corruption, thus amending abstract views about coalitions, interests, and civil society. Third, the literature corrects the wrong view as if the market is the solution to political corruption. Shifting attention from incentives to agents and social relations may offer a new lens through which scholars can examine the behavior of both politicians and the very wealthy few, including corporations. With such an approach, which is more classical in nature, scholars and citizens can identify those who are willing to risk their political careers and call out those who cowardly refuse to do so. Another change that it might be time to adopt is to distance the concept of political corruption from the question of what should be done to combat it. Corruption ought to be exposed, at minimum, because it violates human dignity. Ultimately, the aim is to trigger public discourse that may lead individual agents to rethink their engagement in a corrupt practice or to start a process that will end in an enforceable policy against it. However, to avoid the language of corruption just because "the system is here to stay" is to be unfaithful to the truth and will only serve to strengthen the corrupt system.

What is needed in order to curb corruption is not only good institutions but also good politicians who are willing to confront the very wealthy few and good citizens who are willing to demand more from their representatives. One way or another, to conceive corruption in contemporary democracies through the lens of simplistic economic or institutional theory is to gloss over crucial elements, distinctions, and insights associated with the classical view of corruption. Among these elements is sensitivity to the power of the very wealthy few – the grand or economic elite – and an understanding that good politics depends

not only on institutions but also on virtue, sacrifice, and proper power relations.

Political Conflicts; Political Crimes; Political Violence

## Introduction

In Bangladesh, political crime has achieved a great attention of sociologists and criminologists. Political crimes are marked by the intra- and interpolitical parties' violent conflicts, brutal clashes in educational institutions between and among student political organizations over establishing supremacy and capturing seats and

hostels, sporadic violence over holding political rally, conflict between political groups in terms of elections, using state instrument to suppress the opposition political parties, political involvement and interferences in recruitment of government jobs, attacks and killing of opposition groups activists, corruption and illegal demanding of fees from government development projects, demanding illegal political quotas by ruling student political organization in educational institutions, tender related political crime, attack on law enforcing agencies by political parties, destruction of public properties during the periods of hartal by oppositions political parties, indiscriminate torture by ruling parties on opposition political parties activists, grabbing of land of poor people's by ruling party activists, destruction of environments through indiscriminate cutting of trees by political activists, and so on. There are many factors behind these types of political crimes including economic, social, and political dimensions. Except for these types of political crimes, there are different dimensions of political crimes, but in this study, the published politically connected crimes at newspapers are only a matter of discussions. The objective of this paper is to investigate different types, actors, and associated factors of political crimes in Bangladesh.

## Definition of Political Crimes

Political crime refers to politically organized, motivated, linked or supported anti-moral, antisocial, and anti-legal activities committed by political activists through using political identity and power.

## Conceptual Discussion of Political Crimes

There is no universal definition of political crime. Ross states that, "political crime is rarely examined when studying the dynamics of crime, justice and law." He also mentioned that there are various criminal acts which are considered as political. Sedition and treason are considered by state as political crime because of threat to the order (public, social, or otherwise) or national security. Sometimes, when incumbent governments occasionally engage in repressive action against its law-abiding citizens and harass are considered as political crime. According to him, oppositional and state-initiated harmful acts increasingly understood by many scholars as political crime. There are many obstacles of understanding the political crime. Ross identifies the lack of consensus with respect to a definition, availability of reliable information, rigorous analysis, and/or interest in political crimes (Ross 2012). According to Webster (2013), "political crime is the violation of law or of the public peace for political rather than public reasons." Furthermore, political crime also indicates to the serious violation of the law that threatens the security or survival of a government (ASK 2013).

Moreover, there is no widely accepted theoretical explanation of political crime. But few scholars discussed some relevant theories. For example, Merton cited in Ross in earliest provided a theoretical framework which partially touches the political crime. According to him, "anomic theory of deviance (that is, strain theory), individuals live in societies that have a considerable amount of 'structural dysfunctionalism.'" This in turn leads people to experience to an ends/means discrepancy. These processes combined together create stress. In order to minimize discomfort, individuals have five options. One of which is rebellion (nominally types of political crime). The limitation of Merton's theory is it's too limited for a more encompassing understanding of political crime (Merton 1938, 1964, 1964; Kelly 1972 cited in Ross 2012). Moran describes, "sequential stages which in successive combination might account for development of political crime." The first step involves what Moran calls "predisposing conditions or background factors, the conjunctions of which forms a pool of potential political criminals. The conditions exist prior to an individual's decision to commit a political crime and by themselves do not account for his behavior." The aforementioned perspective includes the concept of strain and "a political problem solving perspective." The latter consists of "situational contingencies which leads to the commission of political crimes by predisposed individuals." Moran advocates a five-stage "developmental model" consisting of

the following steps: (a) strain, (b) political problem-solving perspective, (c) a turning point event, (d) commitment to act, and (e) engaging in the political crime (Moran 1974 cited in Ross 2012).

Turk has offered an alternative perspective. His structural conflict theory posits that although power and inequality are important factors in explaining political crime, the cultural gap between offenders and authorities is the primary factor that leads to the commission of political crime. The conflict theory states that the political organization formed because of conflicts between individuals, families, tribes, or groups to attain a good means to live. Material gain, opportunities, resources, and power are the main sources for which people become united and select the course of action in the political organization. According Austin T. Turk, "the Political organization of social life results from and in characterized by conflicts (often more implicit than explicit) among different individuals and groups of people trying to improve and ensure their life chances-that is, the likelihood that they, at least will have the means of opportunities to realize their respective vision of the good life." Conflicts between individuals often play important role in aggravating wider conflicts. His analysis also shows that the political crime occurred in organized form (Turk 1892).

The radical conflict theory originated from Marx and Engels, where Marx suggested that conflict in society is the result of the scarcity of resources (property, wealth, power, jobs). This creates inequalities among individual and constituencies, which in turn lead to a struggle as to who possesses these resources and who do not. During the 1960s, a number of theorists applied these theories to crime. For example, Quinney, a neo-Marxist suggested that class struggle affects crimes at least in three ways. Quinney, a leading radical conflict theorist, argued that all crime in capitalist societies (which stresses individualism and competitiveness) should be considered a manifestation of class struggle, whereby people strive for wealth, power, money, status, and property. In a country dominated by capitalist mod of production, a culture of competition arises. This is seen as normal and desirable and takes many forms, including criminality (Ross 2012).

After analyzing many theories, Ross developed a new theoretical framework of political crime. He states that "political crimes is the result of complex interplay among individuals (I) situations/opportunities(S), organizations (O), resources adequacy (R). He calls it ISOR relationship." According to Ross, although many political crimes are committed by groups that are formally or loosely structured, whether oppositional or state organizations, these activities are in the final analysis committed by individuals. These people are working within the structural confines of informal or complex organizations, political systems, political economies, and different cultures. They make decisions and act, while often denying that they are not engaged in any kind of wrongdoing.

## Typologies and Actors of Political Crimes in Bangladesh

There are many types of political crimes in Bangladesh which occurred by political parties, groups and individuals. Political leaders and activists are performing several types of crimes by using their political affinity, identity, and power. They don't care about laws and regulation of the country. "Might is rights" policy is most applicable to them. "Culture of impunity" in the justice system of Bangladesh for political consideration is making the situation more degrading day by day. Political crimes are not only limited within political boundary but affecting civilian lives and property. Widespread political crimes like subversive corruption by political leaders, state-sponsored violence against opposition political leaders and activists including disappearance and crossfire, oppositional initiated political violence like random destruction of public properties in terms of hartal or political rally, arbitrary arrest of opposition political leaders and activists by law enforcing agencies, bloodshed conflict between student organizations at educational institutions, deadly clash over establishing supremacy, etc. are well known in Bangladesh. There are various

factors behind these crimes including economic, political, and social and so on. Intra-political group violent clashes and intergroup political conflict result in many deaths and thousands of injured and casualties in every year. In the following section, various types of political crime with different dimensions on the basis of news published by the Prothom Alo, a Bengali daily newspaper in 2010 discussed as follows:

### Political Crime in Educational Institutions by Students Wings

Political crimes in educational institutions especially in higher educational institutions (colleges and universities) occur at a frequent basis. There are different categories of politically motivated and connected crimes in educational institutions. In most cases, the student organizations or wings of major political parties are involved in these criminal acts. These includes intra-political parties student wing deadly clashes, attack on rival groups, interpolitical student wings' bloodshed conflict, attack on ruling student wing by opposition student organization, attack on opposition political parties' student wings' activists by ruling, assault on teachers by political leaders, illegal demanding of quotas in terms of admission tests, and so on. In many cases, admission process of different higher educational institutions are being halted for certain periods because of ruling wing student organizations pressure on administration. According to the published reports of newspapers, in 2010, different types of political crimes in educational institutions were presented. The following tables categorically describe various criminal activities performed by major political parties' student organizations:

The analysis of the reports (Kamal and Islam 2013) of the newspapers shows that in 2010, the total number of intra-political student organization clash were 23, interpolitical parties student wing clash were 8, attack by oppositional student political organizations on ruling party student wing was 1, attack by ruling student organizations on oppositions were 10, respectively. Illegal quota was demanded by the ruling party student wing (Chatra League) in four educational institutions. In addition, the total number of assault or attack on teachers by political student organization were four. In all these cases, approximately 575 persons including students and teachers have been injured, and 8 students were brutally killed respectively.

The most pervasive factors behind these crimes occur over establishing supremacy at campuses, declaring new committees, capturing halls, hostels and seats, tender, trifling matters, economic factors, ideological differences, and so on. In most cases of conflicts, university authorities did little except declaring an indefinite period of vacation. Law enforcing agencies become silent or inactive when deadly conflict take place at campuses. Few cases of students killing at educational institutions have seen proper investigation and punishment of perpetrators. The incumbent ruling party always shows their silence when any student out of their wing is being brutally killed.

### Intra-Political Parties Conflict in Bangladesh

Beyond educational institutions, political parties' activists engage in intraparty conflict. This type of conflict does not occur only among the ruling party's activists but also among the opposition as well. These types of political conflict actually occur among the leaders and activists of mother political organizations on several issues including tender, illegal business, holding new committee, establishing supremacy in certain area, establishing supremacy during elections, previous enmity, over holding rally at same places, property dispute, and so on. The analysis of Prothom Alo reveals that the total number of intra-political party conflict were 29 and 7 among the ruling party, Awami League and opposition Bangladesh Nationalist Party (BNP), respectively. Total numbers of attack on rival groups of ruling party were 11 and 1 in opposition. In addition, 549 people were injured, and 12 persons were brutally murdered due to intraparty violent clash. Finally, 48 intraparty conflicts were held according to the Prothom Alo report. But, really, this number may be more.

### Interpolitical Parties' Conflict

Interpolitical parties' conflicts beyond educational institutions between the activists of major

political parties of Bangladesh occur at a frequent basis. Deadly conflicts occur on several periods, and issues depending on the context including in the period of oppositional imposed country-wide day-night shutdown, over establishing supremacy, holding rallies and processions at the same places, before and after national and local elections, political disputes, previous memory of repression, ideological differences, and so on. The newspaper reports of Prothom Alo in 2010 shows that at least nine violent interpolitical parties' conflict occurred in several parts of Bangladesh. In these cases, hundreds of people were injured and many died.

### Clash Between Law Enforcing Agencies and Political Parties

Bloodshed clashes between law enforcing agencies especially police and political parties especially with oppositional political parties have become the political norms of Bangladesh. But, this type of clash with police indicates to abhor the law and order systems of state. Due to that reason, politically motivated clash with polices or with law enforcing agencies could be termed as one kind of political crime. In most cases, clashes between police and the activists of opposition political parties occur on the occasion of holding a rally or procession declared by opposition political parties. Engagement in conflict with police is one kind of crime, but prevention of oppositional parties' peaceful procession and rallies and indiscriminate attack by law enforcing agencies is another type of state-initiated crime as well. Because, according to the constitution of Bangladesh, every citizen has the right to hold peaceful political protest and rally. In the year of 2010, total number of clashes between oppositional political parties and police were six, and between the activists of ruling parties and police were two. In these clashes, many people including police were injured.

### Hartal and Political Crime

Hartal or shutdown is a political and democratic right according to the constitution of Bangladesh. But, this instrument frequently used by political parties especially by oppositions to force government to do anything or to protest against government on any specific issue. There may have been a certain issue of hartal including political demand and protest against repression of government. In terms of hartal, widespread destruction of public property including vandalism of cars, firing on buses, bursting bombs, and sporadic violence marked the whole country. In 2010, 171 different types of vehicles were vandalized by opposition political parties' activists and about 26 by ruling party activists on different events, respectively. In most cases, huge numbers of vandalism of cars took on occasions of hartal.

### Attack on Opposition Political Parties by Ruling Parties

Repression and indiscriminate torture by ruling party on opposition leaders and activists are well known in Bangladesh. These attacks don't wage only the opposition party activists but on their homes, business institutions, and offices. According to the Prothom Alo reports, in 2010, total numbers of attack on opposition political parties' activists and in their political offices were 20 across the country. In these attacks, many persons were injured and many were killed. Culture of impunity by the justice system of Bangladesh to the killer of opposition leaders blatantly have been observed by the people of Bangladesh. However, ruling political parties' men also are being attacked by the opposition political parties' activists at different places of country. But, all issues generally have political affiliation. In 2010, three incidents of attack on ruling party activists by opposition have occurred which have been reported by Prothom Alo.

### Attack on Law Enforcing Agencies by Opposition Political Parties

Police or law enforcing agencies are being targeted by opposition political parties when they think that policemen are an obstacle to hold their rallies or processions. Sometimes they may have different intentions including breaking the strong mind of police or law enforcing agencies. The analysis of the news reports of Prothom Alo of 2010 states that total numbers of attack on

police or law enforcing agencies were four by the opposition political parties.

### Political Vandalism of Vehicles

Vandalism of vehicles including bus, private cars, and trucks has been a political culture in terms of political protest, hartal, etc. In 2010, the total number of vandalism of vehicle by the opposition political parties were mentioned by Prothom Alo was 171 and by the ruling party activists' were 26. Dire consequences due to the indiscriminate destruction of public property may affect transpiration, economy, and the glory of Bangladesh.

### State-Sponsored Violence

By using state instrument as a means of violence and repression, often incumbent government wants to suppress opposition political parties' demonstrations. To do so, there may have many processes including mass arbitrary arrest, imprisonment of opposition leaders, disappearances, etc. According to the reported data of 2010 published by the Prothom Alo, it shows that about 1284 opposition parties' activists were detained by law enforcing agencies.

### Tender-Related Political Crime

In Bangladesh, tender is an important issue and a source of political crime. In most cases of tender, the local ruling political leaders become involved. Ruling political leaders approach illegally to get the tender. According to the data of 2010 reported by the Prothom Alo, eight political crimes over tender occurred in different places on different development projects. This type of crime includes creating a hindrance in terms of calling and selecting the individual or company. Political influence and power become the main elements of getting the tender work. Political leaders try to get the tender by hook or by crook. Sometimes violent disputes between two political groups over tender have taken place.

### Government Jobs Recruitment

The government job recruitment sector of Bangladesh is a better field for criminals. This type of crime includes taking bribe for recruitment into jobs, recommendation by political leaders (member of parliament, ministers, local leaders, etc.), and so forth. The ruling party plays key role for criminalization of job sector in Bangladesh. In all kinds of government jobs (from fourth class to first class government jobs), subversive corruption and illegal recommendations for recruitments by political leaders occur. In 2010, seven big incidents of political interference in recruitment of government jobs at different hospitals, educational institutions, and administrations performed by ruling political leaders were published by Prothom Alo.

### Environmental Hazards

Trees are the main sources of environmental security. River flow is important to get rid of over-inundation in terms of floods. In many places of Bangladesh, illegal cutting of huge numbers of trees and stopping the river flow by creating an artificial dam for catching fishes by local political leaders were published by daily newspapers. These indiscriminate cutting of trees are a threat to the environment. For that reason, it can be considered as crimes against environment. For example, a report states that 21 trees on street have been cut by Awami League leaders (The Prothom Alo, January 03, 2010). Another report states that a ruling local leader is involved in catching fish by creating an artificial dam violating the law into the Padma River at Faridpur with the cooperation of an opposition local party leader. This type of artificial dam stops the river flow and creates a new shoal on the river basin (The Prothom Alo, January 1, 2010). Furthermore, a report states state that a hundred-year-old tree of a school has been sold by a BNP leader to an Awami League leader without permission of the authority (The Prothom Alo, January 12, 2010). In addition, in recent days, thousands of trees have been cut during hartal periods. In 2010, five reports of crime on the environment by political leaders were published in Prothom Alo.

### Grabbing the Land of Landless People by Political Leaders

News on grabbing of land by political leaders in rustic areas often publishes by daily newspapers. This type of crime is being committed by the

powerful rural political elites. The political identity of grabber especially the ruling political party leader enjoys the immunity of being punished by law enforcing agencies in many cases, and the "might is right" policy can describe the situation better. The report of 2010 indicates different incidents of grabbing land of poor people by local ruling political leaders. For example, a report states that a pond of landless people has been illegally captured by a ruling party man in Jhenaidah district, which is being used by 80 landless poor families (The Prothom Alo, January 3, 2010). According to reports of the Prothom Alo in 2010, seven incidents of illegally grabbing of lands of poor people by political leaders occurred.

### Illegal Sand Business by Political Leader

Political leaders do many types of crime by using political power. Illegal sand business is also another type of crime committed by the political leaders. In 2010, three incidents of sand business by local political leaders were reported by the Prothom Alo. This illegal sand business often becomes harmful for local people and the environment. A violent conflict between local people and ruling leaders on illegal sand business also occurred in 2010.

### Corruption in Development Project by Politians

Government development project is one the most important sector of corruption by political leaders. In 2010, five incidents of corruption and demanding illegal fees by ruling political leaders on different development projects were reported by the Prothom Alo.

### Assault on Administration's Personnel by Ruling Leaders

In Bangladesh, sometimes, the incident of assault on administration personnel occurred by the ruling party leaders in different places. The incident of assault occurred especially when the administrative man avoids illegal demand by politicians. Sometimes political leaders physically harassed and mentally tortured administrative officials and were threatened to be sent in a remote area if they don't follow his order. In 2010, five incidents of assault by ruling political party men on administrative officials were reported by the Prothom Alo.

### Violence Against Women and Political Connection

Violence against women is a crucial crime. Sometimes politically connected personnel assault on women because of his political power and get immunity from law enforcing agencies by using the political power. According the analysis of the Prothom Alo reports, in 2010, three incidents of assault on women by political leaders and activists occurred. But, in these three cases, no persons have been arrested by law enforcing agencies because of their stronghold with ruling party.

### Other Types of Political Crime

Except above political crimes, there are many types of politically motivated and connected crimes. These include attack on journalists, civilian people, and on market places by political activists. Journalists often become target of violence by political leaders and parties. Furthermore, political activists may attack on a market place or in a public place for a trifling matter. In 2010, eleven incidents of different types of crimes except above described the types occurred in different places of Bangladesh.

### A Holistic View of Political Crime in Bangladesh

The above description contains different categorical and types of political crime in Bangladesh. The daily Prothom Alo published approximately 402 reports on political crimes in 2010. According to its published reports, approximately 2129 persons severely injured due to the political violence, and 24 persons have been brutally killed (Kamal and Islam 2013).

## Conclusion

Political crimes have dire consequences on physical, mental, social, economic, educational, and environmental aspect as well. There are several types of political crimes. The pattern of political

crime may change over time. In recent days, these include violent political deadlock and conflict between and within political organizations, bloodshed clashes at educational institutions, demanding illegal quota and interfering into admission process, state-sponsored violence against oppositions including disappearance and arbitrary arrest, culture of impunity for political consideration, corruption by political leaders, interference and recommendation for government jobs recruitments, indiscriminate torture by police and ruling on opposition leaders and activists, sporadic violence by opposition in terms of hartal and demonstration and destruction of public properties, tendering, crime against the environment (trees, rivers, and hills), conflict over establishing supremacy and holding rally, violence against minority before and after national elections, and so on. In most cases of political crimes, ruling party activists are vigorously involved.

To prevent these subversive political crimes, the incumbent government should take a stringent action against the perpetrators who are engaged in criminal activities by using political power and identity. Law enforcing agencies should act neutrally and strictly to detain perpetrators. The culture of impunity should be abolished from the justice system of Bangladesh. More frequent news should be published by mass media on criminal activities performed by using political power. Finally, political will of government and cooperative initiatives by masses, civil society, mass media, NGOs, and government to eradicate political crimes from society could be more effective.

# Political Culture and Good Governance in Nigeria

Joseph Lere Omiwole
Kinsey College of Education, Ilorin, Kwara State, Nigeria

## Synonyms

Political culture; Political orientations; Political behavior

## Definition

Political culture is a set of beliefs, orientations, and opinions of a citizen toward the form government and his political system. While good governance is the process of making the institution of the state worked in a way that will make the best use of the resources of a particular state for the betterment of the citizens.

## Introduction

Synergy between political culture and good governance cannot be overemphasized, most especially in a third world country like Nigeria. Political culture as part of a larger culture of a society developed simultaneously with other cultures like Economics, Religious, and Social culture and all are intertwined. As noted by Archie Brown and Jack Gray (1976) political culture is not divorced from a "culture" in the wildest social sense, but on the contrary related to cultural values and orientations of people which focus attention on that part of culture which bears relevance to politics.

With critical examination, the culture of any society consists of three basic elements, behavioral patterns, skills, and artifacts. The behavioral patterns will determine how consistent and innovative the citizens of the community are in projecting and promoting the cultural values of the society. The skills will portray how the imbibed culture has been put into use for the betterment of the society and in line with the principles and guideline of the society. While the artifacts element hinged on the history and development of the society based on the concrete and feasible things in the society such as buildings, crafts, and all other man-made things.

In essence, Political culture of the society will dwell much on behavioral pattern of the leaders in piloting the affairs of the community in line with the acceptable norms and value in a way that will promote the society and accord its respect among other communities. There are two ways to a coin. It is either leader got the right orientation and adopts it in the running of the society or got it wrong and does otherwise.

It is from this background the entry will look critically at how well culture are the current set of political leaders in Nigeria about the dynamics of Nigerian political system, their understanding and promotion of governance, judicious management of nation's affair, and efforts in projecting the image of the country positively among the committee of nations. In a four-segment analysis, the work will start by conceptualizing political culture, good governance, assessing Nigeria's political culture, sectionalizing the effect of Nigeria's political culture on good governance in Nigeria, and conclude.

## Political Culture Clarified

Variation in definition of political culture just as other concepts in political science was due to authors and their background. But no matter what, there is always a converging point through which each author meets either in their definition or explanation of the concept. Roy Macridis (1961) defines political culture as the "commonly shared goals and commonly accepted rules." While Samuel and Adam (1958) says that it is one of the four variables crucial to the analysis of political system, that is, it is about the value, beliefs, and emotional attitudes about how government ought to be conducted and about what it should do.

To Ayeni Akeke (2008) political culture is an aspect of the general culture of the social system which deals with the attitudes, beliefs, opinions, orientations, and behavioral patterns that people have toward political institutions, events, processes, functionaries, and the like of their political system. Whatever orientation received through the process of socialization will help an individual to his or her nature and determine his or her mode of participation in any political issue either personal or general. Lucian Pye (1962) contends that political culture is a set of attitudes, beliefs, and sentiments which give order and meaning to a political process and which provides the underlying assumptions and rules that govern behavior in the political system. Pye's definition shows that political culture is not only an imbibed ideal but it also involved operating norms of the polity. Political culture is also seen as a system of empirical belief, expressive symbols, and values which define the situation in which political action takes place (Sydney and Lucian 1963). Political culture varies with political system, but to Ayeni (2008) some features are common to political culture of all political system, regardless of their diversity. He mentioned some of these features as:

(a) Guideline provision for members of political system for dealing with various issues
(b) Choosing among the various forms of political organizations
(c) Determining the political ideas that should be pursued
(d) Standards of political conduct and morality against which the performance of political functionaries should be judged
(e) Basis of measuring the performance of political leaders, institutions, and others

Almond and Verba (1963) classified political culture into three main types based on their active role in the political process. The first is the

parochial culture where people have little knowledge of the political system. In fact people of this political culture have little or no contribution to the happenings in their political environment. The second type is subject of political culture where people are aware of things in their political environment but does not participate or play any role in it. While the third one is participant political culture, where citizens are aware and participate in both inputs and outputs of government actions. In the real sense, no political system fit perfectly into any of these three political cultures, but what we have due to the complexity of the society is the mixture of the three types which scholars refer to as civic political culture.

## Good Governance Clarified

Governance is a concept that depicts the process of decision making and the process by which decision are implemented or not. There has never been a community where human being exists that the issue of governance will not arise, either corporately, internationally, or nationally. Governance is like the two sides of a coin that have government and people at its side. To United Nations Economics and Social Council, government is one of the actors in governance. Other actors involved in governance vary depending on the level of government that is under discussion. The bottom line is that the decisions that are going to be formulated and implemented are to address certain problems, and can be truncated along the line. Some of these decision making and implementation are often influenced as a result of corrupt practices or leads to corrupt practices.

Therefore, good governance to Tanbuwal (2013) is the process of governance that is participatory and all-inclusive in not only promoting the cause of human capital development but also turning on fine basis of safeguarding the interest of the governed.

Nwosu and Gloria (2015) see good governance as the capability of the state to perform its key functions in response to the needs of the citizens and to be accountable for what it does. These definitions place emphasis on good governance in respect of the people-centered ideology, needs of the people, public interest, transparency, accountability, and responsibility of the policy maker to the people. In the actual sense, good governance refers to the proper running of a state. According to UNESCO, good governance has eight major characteristics: participatory, consensus oriented, accountable, transparent, responsive, effective and efficient, equitable and inclusive and follows the rule of law. To Adegbami and Adepoju (2017) good governance manifests in the area of law, transparency, accountability, citizen participation among others which are sine qua non for national peace and development. Good governance ensures that corruption is minimized and the action taken is responsive to the present and future needs of the society.

Good governance is a global concept which came to prominence after the end of cold war in the early 90s. In fact the IMF was the first to adopt good governance as a condition for lending to underdeveloped countries. The former United Nation Secretary-General Kofi Annan conceived good governance as the single most important factor in eradicating poverty and promotes development. To him, lack of good governance will continue to promote hunger and underdevelopment (Annan, cited in UN 1998).

The inability of the state to be run according to the specified criteria identified above leads to what is called bad governance. According to the World Bank (1992) bad governance has many features which are failure to make a clear separation between what is public and what is private, arbitrariness in the application of rules and laws, excessive rules, regulations, licensing requirement which impede the functions of markets and encourage rent seeking, priorities that are inconsistent with development, misallocation of resources, and excessively non-transparencies in decision-making. All these, sum together creates an environment that is hostile to development which is the main essence of government. In the event of bad governance, the authority of government over their subjects will be eroded progressively and bad governance represented by

corruption and lack of accountability and transparency will provide opportunity for the state resources to be squandered at the expense of the masses.

## Nigerian Political Culture in Retrospect

Nigeria is one of the most fragmented countries in the world today and the division criss cross between religious and ethnic line. One would have been of the opinion that after independence from Britain, ethnic identification would have given way to national identity, but reverse is the case. Only few Nigerians think of themselves as a Nigerian while ethnic identification became more as a source of pride, dislike, and division.

The entity known as Nigeria today comprises of different empires and kingdoms scattered over large expanse of land with their distinct cultural identity before amalgamation in 1914. In fact, there are over 250 ethnic and heterogeneous groups scattered around modern entity called Nigeria with their distinct culture and administrative control. But for the purpose of this work, I will focus on the three main groups namely Yoruba, Hausa/Fulani, and Igbo.

The Hausa/Fulani before annexation and amalgamation operated a kind of centralized system of government where the sole authority centered round the emir. Although there were officers and chiefs that help the emir in the day-to-day administration of the emirate, like Madawaki, Galadima, Sarkin Fada, Sarning Ruwa, Sarkim Pawa, etc., these chiefs performed only in an advisory role. Emirates were ruled based on Islamic doctrine and justice and were administered through Sharia laws by the Alkalis (judges).

The Yoruba pre-colonial political system ran a kind of check and balances system of administration. Very distinct from Hausa/Fulani in the way power and authority were administered in the kingdom. There were various chain of command from the family head to Baale (community head) to Bale (village head) and finally to Oba in council. The king heard and spoke through the eyes, ears, and mouth of his chiefs or traditional advisors and he enjoyed no monopoly of both secular and spiritual authority like the emir in Hausa/Fulani kingdom. The Oba (king) can be checkmate by the chiefs (the oyomesi) and the Ogboni (secret cult members). The king was highly respected and his authority well renowned.

Law making was the responsibility of the Oba and the senior chiefs. Judicial administration started from the family head through the compound head were always private things where issues were settled amicably. Only serious cases were brought to the presence of the Oba and his chiefs and whatever decision is taken there is the final.

The Igbo traditional administration which is better termed acephalous in nature is an administration that had no centralized political authority. The system of authority was run by balancing small, equal groups against each other by the ties of clanship, marriage, and religious association. The highest decision-making organ then was the council of elders in conjunction with the age grades and some other title holders like Ozo and Ofo. As there was no clear line of authority among the Igbos, there was no special institution for enacting laws. In this sense, it was the council of elders that made laws for the village, so also the age grades and the one made at their shrine. Elders in the family settled minor dispute among members and most of these are done based on compromise. However, any dispute that could not be settled by family heads is taken to the elders of the village. Early account reported that Dutch merchant who visited Benin Kingdom then in the middle age was so impressed of the orderliness that he compared it favorably with Amsterdam of his age. Arabs, Portuguese, and French merchants had also testified to this orderliness and system of administration.

Invariably, the colonial warlords in 1914 with disregard to cultural and ethnic background of the groups met on ground glue together people of different backgrounds without any input in their coming together. The centralized but monarchical kingdom of Yoruba, Hausa/Fulani autocratic system, and republican and decentralized system in the eastern part were put together under new and foreign order and administration. As recounted by Achebe (2012) in his personal history of Biafra

"There was a country," the amalgamation of the southern and northern protectorate inextricably complicated Nigeria's destiny, and Animists, Muslims, and Christians alike were held together by a delicate, artificial lattice. Buttressing this argument, Ademoyega (1981) in his book "Why we struck" which detailed Nigerian first military coup in 1965 contended that one can easily understand why there was a fundamental difference between the political aspiration (culture) of the leaders of the south and north. In the south, political leadership sprang from the people, that is, from the grassroots. These people had been the custodian of their own civic right before the British came. In the north however, the ruling class made up of the sons and kinsmen of the Emirs took over the political leadership of the people. Unfortunately, they represented their own class interest rather than popular will of the masses.

With the foregoing, it is very difficult for Nigeria to have a homogeneous political culture. The predominant ethnic groups such as Yoruba, Igbo, and Hausa clearly constitute political sub-cultural group. The exhibitions of these individual cohesive political cultures different from each other resist amalgamation and integration into a single one that can benefit the country. For stability and progress of any political system, it is important that certain basic common assumption and beliefs are shared for relatively cultural homogeneity. This is very important for the state to reach some level of agreement on the basic nature of politics, the general role of government in society and the legitimate goal of policy and participation. In a situation, where such culture does not exist, mistrust always takes the center stage as we experience in Nigeria. Governmental policies that are popular with some sections of the state are likely to be extremely unpopular with others. This is why a high level of agreement or consensus concerning the basic aspect of the political system is necessary for the political system to progress.

The problem of nation building in a country like Nigeria zero in on how a leader in such fragmented culture can promote a relatively homogeneous political culture, how can they handle the loyalty to the traditional sub-national unit? In what way can the conflict of loyalty and goals of the sub-unit and issue of national identity be resolved? To Adegbami and Adepoju (2017), political culture affects politics. It provides the connecting link between micro-politics and macro-politics. It constitutes a structure of orientations, values, and norms which helps to ensure coherence in the operation of institution and organization.

Nigerian political system failed to harmonize the different political culture embedded in her domain for a common goal. Even after amalgamation in 1914, the leader of the south and the northern protectorate did not sit together until after the Second World War in 1945. All the struggle for independence were fought by the nationalist leaders from the southern protectorate, but unfortunately, the state power was handed over to leaders from the northern part of the country, those that did not participate in the struggle but loyal to the colonial warlords.

Summarily, Nigerian political system is sharply divided along ethnic, religion, and regional basis which in turn have great effect on the disposition of the emerged leaders and followers to act nationally in the event of issues that promote the state and enhance citizen's standard of living.

## Evaluating Effects of Political Culture on Good Governance in Nigeria

### Culture of One Nation

After 60 years of independence, Nigeria is still battling with the mystery of one nation, the culture inherited from Britain after independence is not a culture of nationhood but a survival culture in the mist of polarization. Even at the point of independence in 1960 the stage had been set for British cronies to take over power as indigenous government. Meanwhile the structure of Nigeria had been done in a way that one of the region (north) is bigger than the other two and it has always been behaving as the lord over the other two (west and east). Even as at the time the Northern People's Congress of the Sardauna's form government in 1960, the party name still remains unchanged to look like national party. Various leaders produced

in Nigeria since then are sectional leaders. Each region at a cut throat rivalry over the development of their areas which led to manipulation at almost every governmental program to favor their areas. From population census of 1962, to the splitting of western region in 1963, electoral manipulation in 1964, etc. neglect of other areas by the seating president, most especially northern president has been going on for long and still continues. With this notion, hardly will the current political leaders being able to take the country higher than the way it is now. Culture of continuity is very strange to a Nigerian leader, hence the witness of various abandoned program and project everywhere.

Nigerians have grown more skeptical and cynical about politics and politicians, hence the fluid and unstable political terrain we are witnessing nowadays.

### Culture of Mediocrity, Ethnicity, and Cultural Cleaverage

Another major determinant of current political culture in Nigeria is the culture of mediocrity, ethnicity, and cultural cleaverages, and this has been affecting good governance in Nigeria. Good governance is anchored on leadership, hence no ordinary types of leader can perform miracle in a country like Nigeria. Tolerance, intellectual comprehension, hard work, selfless devotion, statesmanship, and burning sense of mission which are some of the virtues that are necessary to make a success in a great nation like Nigeria is greatly missing among the leaders. There is a general belief that an emerged political leader from any ethnic group gives a greater consideration in development to the area where he comes from. This gives credence to the notion that every group should do everything possible within their reach during election to put someone from their ethnic group at the helm of affairs in order to attract regional development not national development in respective of the pedigree of that person.

This belief informed the emergence of somebody like Alhaji Shehu Shagari, a Fulani and Teacher Training holder to emerge the president of the Federal Republic in 1979 at the expense of a well-experienced Obafemi Awolowo who happened to be a renowned lawyer. The same scenario was also repeated in 2015 when Mohamadu Buhari, also a Fulani from Katsina and a school certificate holder with pronounced health challenges emerged as the president at the expense of a renown academic in person of Dr. Goodluck Ebele Jonathan. As buoyant as Nigeria Economy was before Buhari's emergence in 2015, everything nose dive within four years in office and the country started borrowing irrationally to finance budget and meet other government obligations. Most of the key political appointments were given to politician of Northern origin regardless of their competency and age. Federal character and zoning formula were relegated to nothing and people of questionable character take the center stage of governance. Prudent and visionary leader will think more of managing available state resources judiciously than borrowing and mortgaging the future of the country as we are experiencing currently.

### Culture of Corruption and Gross Mismanagement

Government is the most vital actor of good governance. It is necessary that government official should be appointed on merit and be accountable. Unfortunately, Corruption has almost becomes the norms today in Nigeria. It is a popular saying in Nigeria that "government business is nobody's business, therefore stealing government fund is not bad." An average Nigerian does not belief in the culture of accountability and transparency.

The rank and file of leaders that have attained leadership position in Nigeria since independence had in one way or the other lacked vision and has been engrossed with corrupt practices leading to maladministration and mismanagement of public resources, hence the economic setback and abject poverty as national heritage as experience in Nigeria. Professor Anezi Okoro, in his introductory remark as the chairman of Dialogue 33, an African Leadership Forum argued that through a complex mix of mismanagement, pandemic corruption, primitive greed, and gross incompetence, leaders in Africa (Nigeria Inclusive) have comprehensively retarded the growth of their nations and peoples and relegated them to the lowest

rungs of the global economic ladder (Anezi 2000). Azikiwe was accused of using the eastern region to bought over a bank in 1944, Gowon government was also accused of corruption over the importation of cement in 1975, also Muritala administration sacked a large number of government officials and civil servants who were accused of misuse of power, Olusegun Obasanjo was accused of converting state money and program to personal used in respect of Operation Feed The Nation (OFN) which was later converted to Obasajo Farm Nigeria (OFN), and the associated land grab under the Land Use Decree then.

Sheu Shgari regime was not left out of the corruption web, his government was alleged in the transfer of hard currency for the importation of rice through the John Mathey Bank of London through which a few leading officials and politician of the leading party, National Party of Nigeria (NPN), amassed large amount of money. Buhari military regime was accused of 53 suit case scandal during the currency exchange in 1985. In fact Babangida during his own regime squander over $12.4 billion Gulf war windfall and rigging of the most successful election in Nigeria in 1993, his tenure was corruption personified. Nigerian money siphoned by Abacha during his tenure to the tune of $ billions are still being recovered up till today from various overseas account. Yar'Adua regime was accused of using his power to frustrate his political friends who were accused of corruption, while Goodluck Jonathan regime was accused of missing government funds to the tune of Billions of Dollars through agencies like NNPC, NDDC, and other ministries which are still being pursued by ICPC and EFCC. The current regime of President Mohamadu Buhari, though claimed he is fighting corruption, is shielding corrupt officers and politicians. In fact, Buhari and his party All Progressive Congress (APC) have been a safe haven for corrupt opposition members that are ready to join APC.

As the socioeconomic and political development of any state depends largely on the ability of its leadership to facilitate, entrench, and sustain good governance, leaders must be committed, patriotic, and discipline. In the Nigeria's over 60 years of independence, there had been little record of socioeconomic/political development. Corruption remains a recurrent decimal in both the public and private sectors of the economy. In fact it has become a norm. Its dimension includes frauds and falsification of account in the public service, taking of bribes and perversion of justice, inflation of contracts, gross embezzlement of funds, among others which creates great obstacle to good governance. Political corruption is a persistence phenomenon in Nigeria. In 2012, a statement credited to Ezekwesili asserted that Nigeria was estimated to have lost over $400 billion Oil revenue to corruption since independence (Okoye 2012). The rise of public administration and the discovery of oil and natural gas after independence believed to have led to the sustained increased in the incident of corrupt practices in Nigeria.

Massive corruption continues to cause underdevelopment and poverty in Nigeria, unfortunately, the set of leaders in the country, despite efforts by successive government to bring down this attitude with the introduction of policies like Anti-Corruption and Patriotism, Discipline and Self Reliance Mobilization program in the 1980s and 1990s, War Against Indiscipline (WAI), War Against indiscipline and Corruption (WAIC), Economic and Financial crimes Commission (EFCC), Independent Corrupt Practices Commission (ICPC), and host of others, they lack the will to bring corruption under control. This culture has really eaten deep into Nigerians system, and this makes it very difficult to change the perception and attitude of the society about it.

### Culture of Mass Rigging and Political Violence

Polarization of Nigeria political system as earlier argued made most the political leaders in the country to be best described as political merchants, they see politics as a business deal that bring forth huge profit. This is why they do everything within their power to get to the position of authority. The culture of electoral violence, use of political thugs to win election by all means and rigging becomes the other of the day. Various means were employed during election to manipulate the electorate in their favor, some of which are

bribing of electoral officials and security agents, using party supporters as electoral officials, pre-stuffing of ballot boxes to favor a particular candidate, falsification of results and forgery of figure, vote buying, and others. They do not believe in service to the people but wealth acquisition, most of them are "political predator" that sees state as their prey and have turned the state into entrepreneur where they go in, make their money and leave, plan for development if there is any is minimal.

In an effort to achieve their aim of controlling the governmental power at all cost, they deploy various means ranging from assassination, kidnapping, disruption of election and campaign rallies, armed youth and political thug with dangerous weapon and drugs, causing commotion and unrest and creating different militia groups. In short, an average Nigerian youth nowadays has become very restive and flippant, and they get engaged in violent, armed robbery, looting, rapping, vandalization, and kidnapping. Thuggery is a turf where Nigerian youth have excelled, and they are ready weapon in the hand of political "warlord" who often equip them with dangerous weapons with which they unleash reign of terror on perceived political opponent. All these acts denied state and citizen good governance and development.

## Political Apathy

An average electorate in Nigeria now does not believe in election and electioneering process in Nigeria, their assumption is that their vote does not count. This act made most of electorate to lose partial or total interest in participating in the political process in the country. During a chat with a politician friend sometimes ago, he confessed that the forthcoming election in the state was just to fulfill all righteousness, because an unannounced result was already on ground and no matter what, the names of those candidates on that will be returned by the electoral commission. As if that revelation was not stunning enough, he further advised me not to even try to venture into politics, that I was not made for such intrigue. Truly to his advice and concern, that is the true situation of things in Nigeria, no matter how rich, big, or holy you are, if you cannot play the ball according to their dictate, you will be frustrated out of the game. According to them, "politics is a dirty game, not meant for a saint." In Nigerian political circle today you will see all calibers of people like political thugs, ex-convict, fraudsters, jobless individuals, and others with questionable characters becoming political leaders while other well-meaning people stand aloof.

In fact, two-thirds of those people that fought for the current democratic experience in Nigeria went back to their shell and did not came forward for any political post or appointment afterward and they were not even considered for any. Most people that constituted the rank and file of National Democratic Coalition (NADECO), the broad coalition of Nigerian democrats formed in May 1994, which fought the Abacha military government to standstill until his death did not feature in Nigerian politics after post-military regime. People like Anthony Enahoro, Bolaji Akinyemi, Ebutu Ukiwe, Balarabe Musa, Ayo Opadokun, Yohanna Madaki, and host of others did not contest either as a counselor, senator, governor, or president. Obasanjo who became president in 1999 was in prison when the struggle for liberation was on. They just fought for democratic rule but not involve in governance and the result is what we see now.

An average Nigerian nowadays does not care about what happen to the state, they are only concern about themselves and their families. Unfortunately, whatever happens to the state is being decided at the political circle, what an irony. In some state, a group of people or family has decided to occupy their state leadership position as their birth right and control the economy of such a state at the expense of others.

## Conclusion

Current assumption by scholars that African nowadays has no culture cannot be anything but the truth. The old culture we left, we find it difficult to go back there while the new one adopted, we do

not really understand. Development of a particular society has so much to do with the cultural expository of the people in the area, either as a leaders or followers. It is over 60 years now that Nigeria gained independence from Britain, invariably, for all that years now, Nigeria had been ruled by Nigerians. Then why can we not experience astronomical development? It is obvious than the administrative culture and nature of state inherited at independence was alien to our previous existence which made the state to be run in clientelism manners, development is alien to them compared to the precolonial period where everyone see the community as their property including the leaders. Cultural value blended with morality dictate to a very large extent approach of people to governance, irrespective of ideology and political affiliation. If there is no alternative to good governance, then leaders in Nigeria should encourage values that will promote it and do away with their current dispositions to negative political attitudes that have been discouraging positive political values among citizens.

# Political Ideology in the Bureaucracy

Jowei Chen[1] and Tim Johnson[2]
[1]Department of Political Science, University of Michigan, Ann Arbor, MI, USA
[2]Atkinson Graduate School of Management and Center for Governance and Public Policy Research, Willamette University, Salem, OR, USA

## Synonyms

Agency ideal points; Agency ideology; Agency preferences; Bureaucratic ideal points; Policy preferences of bureaucrats

## Definition

Political ideology in the bureaucracy (def.). A condensed representation of the policy preferences held by individuals or groups of individuals (e.g., agencies) tasked with carrying out the orders of policymakers.

## Introduction

In political science, research studying the public bureaucracy has focused heavily on whether public bureaucrats prioritize their own ideological goals over politicians' policy directives (Miller 2005). In public administration, scholarship has examined whether public bureaucrats passively (via shared personal traits) or actively (via the pursuit of shared ideological aims) represent the communities they serve (Lim 2006; Meier 1975; Meier and Nigro 1976; Krislov 1974). By concentrating on these topics, research has moved ideology to the heart of the conversation about public bureaucracy. Yet, in so doing, these literatures have exposed a troublesome empirical problem: measuring the ideologies of public bureaucrats is difficult. This entry describes the challenge of measuring bureaucrats' ideologies and the recent

methodological developments that have facilitated the measurement of public bureaucrats' ideologies.

## What Is Ideology?

Generations of political scientists have sought to define ideology (Hamilton 1987), but no universally agreed-upon definition of ideology exists. Indeed, some challenge the concept's distinctiveness and usefulness (Mullins 1972). Thus, although various existing definitions provide a sense of what is meant by "ideology" (notably, Bell (1960[2000], p. 393; Althusser 1971), no definition can claim superiority over others.

With this state of the literature as a backdrop, students of public bureaucracy have turned to the definition of ideology employed by rational choice scholars to lay the theoretical foundation on which to build their empirical estimates. Scholars drawing on the paradigm of rational choice have characterized ideology as a reflection of the policy preferences an individual possesses (Poole 2005). These policy preferences are represented by a mathematical model that describes preferences based on their placement in an abstract space containing all possible policies that could be adopted. In this model, a specific individual's policy preferences can be represented by a location in this space. That pinpointed location is the individual's single, most-preferred policy (the "ideal point") within the entire range of possible policies. Any policy that deviates from an individual's ideal point is valued less by the individual than the policy at the ideal point; the policy's value declines as it grows more distant from the ideal point. With this conception of ideology in tow, individuals are then assumed to act in ways that maximize the utility they gain from adopted policies. In sum, to the rational choice scholar, individuals' ideologies consist of their ideal points, as well as the distance between those ideal points and other points in the policy space; furthermore, individuals act on their ideological leanings so as to maximize the utility they derive from policy.

Viewing ideology via this spatial model of preferences has facilitated empirical efforts aimed at measuring ideology and it did so initially in topical areas outside the study of public bureaucracy. This spatial model enables the empirical estimation of preferences because it implies that an individual's behavior indicates her preferences, due to the assumption of utility maximization. Additionally, this behavior, due to the relational nature of preferences in the paradigm, can be compared with the behavior of others in order to place individuals on a common ideological scale (Poole and Rosenthal 1991, 1997). Locating actors on that ideological scale can be achieved by data reduction techniques that analyze political actors' recurrent decisions and summarize patterns in those data with numerical estimates. Accordingly, to derive ideological estimates, scholars have scaled patterns of voting by legislators, decisions by judges, and stances on legislative votes by executives as a means of placing political actors' preferences on quantitative scales (see discussion and citations in McCarty 2011). These quantitative measures, in turn, could be compared and incorporated into broader analyses testing theories of political behavior and institutions.

Recently, students of public bureaucracy have sought to follow in the footsteps of this research tradition in order to develop quantifiable estimates of the ideologies of public bureaucrats. However, as initial forays into this line of research indicated, unique features of bureaucrats' work environments made it difficult to directly transfer previously-used methods into the sphere of public bureaucracy research.

## The Challenge of Measuring Bureaucratic Ideology

Measuring the ideologies of public bureaucrats, as Clinton et al. (2012) have noted, proves to be more challenging than estimating the ideal points of legislators, judges, or political executives due to the fact that bureaucrats perform a heterogeneous set of activities. Even when looking within a given governmental context, researchers can see

this heterogeneity vividly. The activities performed by a manager in the U.S. Department of Labor, for instance, differ from those performed by a manager in the U.S. Department of Health and Human Services and that manager's activities often differ from those of an attorney in the U.S. Department of Justice or a forest ranger in the National Park Service. Given these incongruent activities, one cannot directly employ the scaling methods used to estimate legislative, executive, or judicial preferences. After all, those methods rest on a comparison of common behaviors in order to infer individuals' underlying ideologies.

Given these difficulties, early studies of bureaucratic ideology offered rich descriptive information about the various policy positions that bureaucrats held, but refrained from attempts to characterize the ideologies that might underlie those positions. For instance, Meier (1975) turned to survey data concerning policy positions and avowed vote choices in the 1972 U.S. Presidential election in order to understand the policy viewpoints of public bureaucrats working in federal, state, and local governments. Meier uncovered a leftward lean in bureaucrats policy preferences, relative to other survey respondents; however, only in their support for "Trade with Communists" and the "Legalization of Marijuana" did the positions of public bureaucrats differ significantly (alpha = 0.10) from the policy preferences of non-bureaucrats (Meier 1975, Table 7). The differences in the distribution of responses between bureaucrats and non-bureaucrats for survey items such as self-reported voting for Nixon, affiliation with the Republican Party, and a range of other policy issues could not be distinguished from mere sampling variation (Meier 1975, Table 7). Moreover, in subtle defiance of the notion that demographic representation translated into ideological representation in the public bureaucracy, Meier (1975) indicated that the bureaucrats' demographic attributes correlated more weakly with their policy positions than did their agency affiliations. These findings were of intrinsic interest, given the limited information available about public bureaucrats' ideologies at the time, yet they gave only an episodic view of bureaucrats' policy preferences (i.e., no attempt was made to consider intra-individual correlations across issue items) and they did not offer any means of comparing bureaucrats' preferences to other political actors (such as judges or legislators), unless those actors were in the pool of survey respondents. Such efforts continued in the decades thereafter as scholars offered summary statistics about specific behavioral patterns that indicated U.S. public bureaucrats' views on specific political matters (e.g., Johnson and Libecap 1994).

However, as those methods were being employed, a theoretical literature that sought to understand interactions between public institutions – such as legislatures, the courts, and the bureaucracy (Ferejohn and Shipan 1990) – began to develop (de Figueiredo et al. 2008). To test the models developed in this literature on the separation of powers, scholars had to develop measures of bureaucratic ideology that could be compared with the rich set of ideological measures available in the study of legislatures, the courts, and the presidency (again, see McCarty 2011 on the latter measures).

## Measures of Bureaucratic Ideology

Given that theoretical models in the separation of powers literature focus on the interaction of institutions, with early models implying that a single ideal point could capture the ideology of a given institution (Ferejohn and Shipan 1990), a first attempt at measuring bureaucratic ideology involved using the historical attributes or policy missions of agencies as surrogates for ideology. This approach rested on a reasonable premise: political factors shape the origins and purpose of agencies (Howell and Lewis 2002), thus categorical variables relating to those structural features can capture an agency's ideological lean. For example, using the partisan control of institutions during the time of an agency's founding provides a stand-in for that agency's ideology (see Lewis 2007 and Lewis 2008 for examples of this approach).

This stand-in for ideology, however, contained many limitations. First, the method of implementing this approach often confounds the ideological information contained in the measure with other, unrelated factors. Consider a measure of agency ideology that indicates if an agency was created under a president affiliated with the Democratic Party or the Republican Party. Any variable correlated with when Democratic Party politicians have held the Presidency – for instance, economic trends – would confound the relationship between the indicator of agency ideology and an outcome variable of interest. Furthermore, such a measure does not convey the ideology of the public bureaucrats in the agency per se unless the structural factors promote self-selection into the agency by ideologically like-minded bureaucrats (as the evidence in Meier 1975 suggests; also, in a related vein, see Gailmard and Patty 2007). Absent the possibility of self-selection, the measure might fail to capture the actual ideological leanings of individuals working in the agency. Finally, the measure does not facilitate tests of models that make claims about the ideological distance of on institution from another (e.g., Ferejohn and Shipan 1990). Such models rest at the heart of understanding the problem of bureaucratic discretion and political control (see Epstein and O'Halloran 1999; Huber and Shipan 2002).

Clinton and Lewis (2008) offered a solution to the latter problem by examining survey data. However, unlike earlier efforts to use survey data to understand bureaucratic ideology (Meier 1975), Clinton and Lewis (2008) conducted a survey that asked academics and journalists familiar with the U.S. public bureaucracy to rate the ideological proclivities of 82 federal agencies. Clinton and Lewis (2008) then integrated these ratings with further information about the agencies themselves to model the latent – that is, unobserved in the data – ideology of the agency. This measure captured subtle differences in the ideological leanings of agencies. However, a later team of scholars – which included both Clinton and Lewis – acknowledged that, from this method, "[p]roblems arise if experts are limited in their knowledge of lesser-known agencies or make similar mistakes in categorizing agencies as liberal or conservative" (Clinton et al. 2012, p. 2). Also, even when setting aside those methodological issues, Clinton and Lewis (2008) presented a measure that – just as with the previous approach of using nominal variables to proxy for ideology – did not offer insight into the ideologies of individual bureaucrats, nor did it enable comparison with ideological measures of other institutions (Clinton et al. 2012, p. 2).

Perhaps the first method of providing estimates of individual bureaucrats' ideologies was ingeniously devised by David C. Nixon (2004). Nixon (2004) recognized that a non-trivial portion of top-ranking public bureaucrats served in Congress prior to their entry into the U.S. federal service. This career trajectory meant that those officials' ideologies had been measured via other scholars' efforts to measure the ideologies of members of the U.S. Congress (Poole and Rosenthal 1991, 1997). Accordingly, one could simply pluck those ideological estimates from prior analyses and incorporate them into empirical tests that sought to understand interactions between public bureaucrats and the Congress (Nixon 2004). In sum, the approach yielded individual estimates that could be compared across institutions. The only problem, however, was that the approach could only yield estimates of bureaucratic ideology for the subset of bureaucrats who had served in Congress – a small subset of the public bureaucracy.

To widen the number of bureaucratic officials for whom ideological estimates were available, while also providing a time-varying measure of bureaucratic ideology, Bertelli and Grose (2007, 2009, 2011) devised a method that could use the public statements issued by top officials to measure bureaucratic ideology. The method collected the testimonies of high-level U.S. federal bureaucrats from 1991 to 2004 and identified testimonies that spoke to legislation subject to roll call voting. Coding procedures then rated these top officials support or opposition for that legislation as if they had issued a vote in a roll call. Integrating these responses with the actual votes of members of

Congress and, then, performing scaling analyses allowed for the estimation of ideological estimates that could be compared across institutions. Although it clearly offered an insightful means of measuring the ideologies of top officials, the method still could not extend to a wider set of public bureaucrats. Only the relatively few public bureaucrats who had issued public statements could have their ideologies estimated by the method.

The formation of a leading team of researchers in this area – consisting of Clinton, Bertelli, Grose, Lewis, and Nixon – led to the development of ideological estimates covering a wider number of bureaucrats (Clinton et al. 2012). Clinton et al. (2012) sent a survey to thousands of public bureaucrats during the presidential administration of George W. Bush. The survey inquired about these bureaucrats' policy preferences by asking respondents about their views on policy issues reflected in legislation subject to Congressional roll call votes; responses to these survey items then were scaled (Clinton et al. 2012). The method, in other words, combined the survey methods of past research (Meier 1975; Clinton and Lewis 2008) with the use of legislation subject to roll-call votes (Bertelli and Grose 2009) – in a framework that placed bureaucrats and legislators in a common ideological scale (Nixon 2004) – to estimate bureaucratic ideology. The method offered a rich set of individual-level and aggregate-level ideal points. However, the survey methods limited the scope of the analysis and made the prospect of updating the ideal point estimates painstaking. Only roughly 33% of individuals receiving a survey request responded, with appointees even less likely to respond (Clinton et al. 2012); furthermore, the resulting estimates only covered the years 2005–2006, thus requiring the procedures to be updated frequently to ensure wider temporal scope.

To develop estimates that covered a larger number of public bureaucrats and that spanned a longer time period, Chen (2010) and Chen and Johnson (2011, 2015) studied a common activity in which a substantial number of public bureaucrats engage: donating contributions to political campaigns. Using the universe of federal campaign contribution data, Chen and Johnson (2015) identified all donors who (1) issued campaign contributions of $200 (USD) or more to incumbent federal politicians or their political action committees (PACs). Then, given that federal election laws require that donors reveal their employers when making a contribution, Chen and Johnson (2015) identified all campaign contributors who listed a U.S. federal agency as their employer. Subsequently, for every contribution issued by a federal bureaucrat, Chen and Johnson (2015) identified the ideal point estimates of the donation's recipient as measured via the method of Poole and Rosenthal (1991, 1997). Then, to estimate an agency's ideology, the researchers took the ideal points associated with contributions issued by employees of a given agency and, weighting these ideal points by the dollar value of each donation, estimated the mean of the ideal points. This led to a measure of agency ideology based on a common activity – campaign contributions – that spanned over two decades and covered myriad public bureaucrats. Moreover, the ability to use dollar amounts as a weighting device allowed the authors to emphasize larger contributions likely to have been issued by wealthier, top-level officials, plus the approach could be readily automated in order to update estimates frequently and it could generate individual-level estimates (see Bonica et al. 2015).

The method, however, was not without potential problems. First, the method fails to offer valid ideological estimates if campaign contributions do not reflect a genuine ideological expression. Ansolabahere et al. (2003) provide evidence to that effect, showing that individuals' contributions can only be interpreted as an ideologically motivated consumption good. Moreover, Gimpel et al. (2008) report that contributions issued by individuals who will not be represented by a candidate (i.e., out-of-district contributors) appear ideologically motivated. However, Gordon and Hafer (2005) present evidence of strategic giving, thereby raising questions that the method

calculates the sincere ideological orientation of public bureaucrats. Furthermore, the weighting scheme used in the estimation assumes that higher campaign contributions come from higher-paid bureaucrats and those bureaucrats' ideologies figure more prominently in agency activities. These assumptions might not be valid and, to a degree, they defy the widely-held view that agency problems in the public bureaucracy mean that even low-level bureaucrats can distort politicians' policy objectives.

## Conclusion

The conceptualization of public officials' political ideologies looms large in both political science's and public administration's studies of bureaucracy. Yet, because public bureaucrats perform highly-variable activities, distilling ideological patterns from their behavior proves to be difficult. Early studies of bureaucratic ideology circumvented this problem by simply supplying summary statistics about bureaucrats' preferences for specific policies and political candidates (e.g., Meier 1975). However, with the development of theoretical frameworks that offered general models of how institutions interacted to produce policy, the need for a measure of bureaucratic ideology – not just individual issue viewpoints – became apparent. Scholars responded initially by using categorical variables to convey the policy orientation of agencies (e.g., Lewis 2007), yet this method was quickly eclipsed by methods that produced ideological estimates from survey methods (Clinton and Lewis 2008; Clinton et al. 2012), analyses of bureaucrats who worked in other institutions (Nixon 2004), the study of public messages delivered by bureaucrats (Bertelli and Grose 2007, 2009, 2011), and the investigation of bureaucrats' campaign contributions (Chen 2010; Chen and Johnson 2011). Despite disadvantages to each of these methods, scholars now possess measures of bureaucratic ideology that can be readily incorporated into empirical tests of models concerning the public bureaucracy.

## Synonyms

Accountability; Agency; Projects; Public sector

## Definition

Agency theory has no doubt been extensively debated. In this study, this theory is extended to investigate the under-researched topic of project participant relationships in the construction sector.

## Introduction

Existing studies imply that there are no agreed or exhaustive list of factors that can fully explain the handling of construction projects, project participant relationship, and accountability issues of the public sector. Different researchers have emphasized on different sets of risk factors. For instance, Aritua et al. (2011) mention that public sector projects are exposed to risks associated with changes in government policy, diverse stakeholder aspirations, and challenges of multiple project procurement. Al-Sedairy (1994) found that project conflicts stem from timing, project concepts, specification issues, as well as costs, claiming that conflicts not only occur at later stages but remain even in the postconstruction period. Poor communication can be another most common project risk (Ceric 2003). In addition, political interference can affect project outcomes where accountability reports may be just reduced to bureaucratic communications and some insignificant stories to avoid public criticism

(Christensen and Skærbæk 2007). It may be challenging to hold public officials accountable where monitors themselves are public servants (Cabral and Lazzarini 2015). What is still under debate is whether political pressure benefits or harms the public agency performance and outcomes (Rojas 2015). Project participant relationship is no doubt complex. Despite its rapid growth, this subject matter has received very little critical attention (Hodgson 2002).

There is little doubt that the agency theory has been extensively debated. This study, however, extends the theory to the under-researched subject matter of project participant relationships in the construction sector. The research is empirically based on a developing South Pacific country, Fiji.

Literature confirms the extensive application of the agency or principal-agent theory in construction, covering risks of adverse selection, moral hazard, and hold-up (Ceric 2013). Interestingly, there is no mention of the relationship between project managers in construction projects (Ceric 2013). As per Ceric (2013: 773), exploring the more complex project participant relationships deserve greater attention. This study is an attempt in this direction.

## Theoretical Underpinnings

This study extends the agency theory by drawing factors from this theory and construction, public sector, project management, and accountability literature to include all project participants and risk factors. Ceric's (2013: 773) work is the first found in literature to have extended the agency theory to construction including other participants like project managers and contractors. To a lesser extent, another study by Hadi and McBride's (2000), also mentioned the role of the agent as more of a subcontractor as they applied the theory to study the role of marketing agents in the public sector information trading market.

The concept of principal and agent can be confusing in the contractual situations of public administration given involvement of multiple parties (Farazmand 2002). This research is thus a buildup of the pioneering work of Ceric (2013) in the construction sector that separates the role of such multiple actors. Like Ceric's (2013) work, this entry describes participants as agent, principal, contractor, and project manager to avoid the confusion of multiple agents/principals.

Literature has well established the relevance of the agency theory since it has been applied to a variety of settings and has been used by scholars of various disciplines (Eisenhardt 1989). The key actors in the agency theory are the principal and the agent. The principal pays the agent to carry out an activity. Interestingly, evidence also suggests reflexive principal-agent relationship, where an agent may enact the role of the principal (Wickramasinghe and Lamb 2002). Central to this theory is the assumption that an agent may optimize its profits at the expense of the principal (agent opportunism). Such a situation is possible because the agents do have more knowledge or information than the principal – they perform the activity with a certain degree of empowerment (Hadi and McBride 2000). However, in construction projects, the principal may also exhibit opportunism (Ceric 2013). Given self-interest, agents do not readily share information with the principal. It is this hidden information/hidden action that generates moral hazard risk (Ceric 2013). The principal will thus try to transfer its risk to the agent by either investing in monitoring systems to obtain enough information about the agency activities or offering incentives to motivate the agent to efficiently perform its interests (Hadi and McBride 2000). Studies such as that of Kauppi and Raaij (2015) argue that agency problems may not only arise with agents withholding information from principals but principals may also hold information from agents.

As per the research question and in keeping consistency with the literature reviewed, the following theoretical model was developed, illustrating the relationship between the key parties. The factors of four self-interested project participants are drawn from the study of Ceric (2013); moral hazard factor is drawn from Ceric (2013) and Klein's (2009) research and risk/issue factors are drawn from the studies of: Aritua et al. (2011) – changes in government policy, diverse stakeholder aspirations, multiple project procurement;

Al-Sedairy (1994) – timing, project concepts, specification issues, costs; and Ceric (2013) – time, cost, quality, and poor communication (Fig. 1).

## Methodology

Ceric's (2013) research was based on an exploratory survey and Delphi methods. This study differs as it employs a qualitative institutional case-based approach, employing convenience and snowballing nonrandom sampling techniques. Individuals who were easiest to reach out to were interviewed first (convenience) and they recommended others who could be interviewed (snowballing).

Data was gathered through in-depth face-to-face interviews and relevant document search. The enterprise annual reports, cabinet decisions, legislation and parliamentary reports, and reputable magazines were examined to formulate questions and to cross-check interviewee responses. The secondary sources were journal articles, textbooks, conference proceedings, theses and dissertations, newspapers, and the internet. In collecting data, information was gathered from many sources, enabling triangulation among different data sources (Eisenhardt 1989).

Overall 22 in-depth interviews were conducted only with those who could provide relevant information, those who were part of the project, and those who were still employed by GSPS at the time of research. Interviewee names and descriptions are withheld given political and job security reasons. Anonymity encouraged provision of substantial information without the fear of being questioned later. During interviews, the researcher used probes to gather more elaborate information. After the interviews, the researcher rephrased the interviewee responses in a summarized manner to correct inaccuracies and to ensure that the receiving, understanding, and interpretation of information were the same as expressed by the interviewees (Wilkinson and Birmingham 2003).

**Political Influence over Bureaucracy, Fig. 1** The agency model in the context of a construction public enterprise (Source: Narayan 2017, for this paper)

The collected data was analyzed on the basis of findings from the case study in forms of interviewee responses and relevant documents. This research used the logic of analytic rather than enumerative induction. The research used Gillham's (2001) transcription and analytical framework for the recording, verification, and analysis of data as follows. Substantive statements in each interview note and extra details (furnished during the interviews) were highlighted while repetitions, digressions, and irrelevant materials were put aside. Similar statements made by interviewees were noted as similarities and dissimilarities were marked. Following this, the researcher went through the collected primary documents to highlight noteworthy information. The researcher then went back to the entire interview notes and documents to note highlighted statements and categorized these as main events. The researcher first created major headings (preconstruction, construction, and postconstruction stage) to note the main events. For validity and reliability reasons, statements were cross-referenced between interviewee responses' and with documents such as the company and ministry documents, published interviews in reputable magazines, and newspaper articles. Dissimilar statements were marked as queries and after an interval of a few days were clarified through quick repeat interviews, emails, or telephone inquiries. The chronological listing was revised after sorting out queries.

This research is premised on a single-case study; as such, findings have limited comparability and generalizability (Blenker et al. 2014). Nonetheless, it can offer insights for later comparative studies of construction public enterprises in other countries, particularly developing countries. While the empirical study is premised on one small developing Pacific Island economy, the study does have potentially wider application for construction public enterprises elsewhere.

## Findings

### Case Background

On 1 January 1969, the boatshed section and slipways were transferred from the Public Works Department (PWD) to the Marine Department, which then became Government Shipyard and Public Slipways (GSPS) (Marine Department 1969). GSPS is now a subsidiary of another public enterprise – Fiji Ports Corporation Limited (FPCL).

The most controversial of all projects ever handled by GSPS was the "Reef Endeavour" shipbuilding project.

### Reef Endeavour: The Shipbuilding Project

While work on the "Reef Endeavour" began in 1989, it was subjected to much controversy from the very outset. The ship owners (Captain Cook Cruises (Aust.) Ltd. and Qantas Holiday Tours Ltd.) were initially involved in a contract with Ship Design Management (Australia) Pty Ltd. (SDMA) which drew up the costings and tendered the job of "Reef Endeavour" to the Fijian Government for $A7.7 million. The Director of Marine, after consulting the authority of the government, signed the contract in December 1989. Upon the 1991 collapse of the contract, government agreed to a new deal of $A7.66 million in 1992 (Hansard Report: Parliament of Fiji 1995). Construction came to a halt in 1991 given disputes but resumed in February 1993. The first dispute was between the shipyard and ship designers given problems with the contract and supply of precut steel. According to the long-service employees,

> The Fiji Government, despite its higher cost estimates signed the initial contract for $A7.7 million upon reassurances by SDMA. Such assurances were supported by estimates provided by SDMA to the Shipyard Manager, only to be found grossly inaccurate later.

Government did initiate a legal action for SDMA's misrepresentation and fraud but dropped it later because of SDMA's liquidation. $F5.5 million was written off in 1991.

It was then expected that work on "Reef Endeavour" would complete by late 1994 but the same did not eventuate. In 1995, the Manager of the "Reef Endeavour" advised that final fittings, testing, and sea trials would conclude by 31 October 1995. But, once again, this did not eventuate because of yet another dispute. A maximum late delivery penalty of $F650,000,

later lowered to $F225,000, was slapped on the shipyard by the clients (The Fiji Times 1995a: 4). GSPS disputed the penalty since clients failed to submit the required designs and specifications which were required to build the ship, leading to additional costs.

On 30 November 1995, the ship stood complete except for a few minor tasks. Government refused to hand over the "Reef Endeavour" to its Australian owners because payments and claims needed sorting out. Government blamed the owners, accusing them of "grossly inequitable contractual arrangements and misrepresentation," while the owners blamed the shipyard for lack of planning and supervision which they said, resulted in high absenteeism and low productivity, causing delays in delivery (AAP 1995d: 5). When the issue could not be resolved amicably, both the parties opted for legal arbitration in Australia (A Special Correspondent 1995: 1). The project was held up for a year in a lengthy and very costly court battle. During the court hearing, the clients/owners argued that the Fijian Government failed to live up to its promise of delivery. A predelivery inspection by the owners in November 1995 revealed a 40-page defect report which according to the owners, the shipyard refused to correct. In December 1995, the government won an official pardon in the prolonged dispute. The Supreme Court ruled that the dispute be resolved through arbitration (The Fiji Times 1995b: 4). On 19 December 1995, the Fiji cabinet decided to rescind the contract because of the "immense" financial losses (AAP 1995d: 5).

Later, the government and Captain Cook Cruises realized that there was no point in prolonging arguments. It was decided that government be paid an additional $F4.5 million upon delivery of the ship (The Fiji Times 1996: 3). The parliamentary debate of 22 February 1996 (p. 2302) revealed that the cost of the project as at February 1996 was some $F20.5 million, while the amount received was much lower – $F11.8 million (Hansard Report 1996). Additional charges (legal fees of aborted arbitration and the cost of furnishing and furbishing the ship) kept flowing which mounted the total expenditure close to $F22 million. Fiji taxpayers hence subsidized the Australian company, a whopping $F10 million.

### Under-Cost Signup and Accountability

There were also issues of "passing the buck" for the substantial under-cost signup of the contract. A top management staff explained:

> The blame was at one time pushed onto the then Manager of shipyard who was the first local Manager of GSPS between the years 1977 and 1992. He refused to sign the initial contract of the "Reef Endeavour" because it did not give much control to their division and was too loose a contract since it was between three parties – the architect (SDMA), the owners, and the builders. Since he was not the one who signed the contract, the blame was considered baseless. Resultantly, he was offered options to join other government departments but he opted for further studies. He was also one of the Directors to the Board of this enterprise.

It was the Director of Marine who signed the contract. PSC was requested for surcharge actions but nothing was done (The Hansard Report 1995: 2425) because the Director had retired and the Shipyard Manager left the shipyard (Hansard Report 1996). There was a discrepancy between the costing done by the shipyard and the actual signup amount (The Hansard Report 1996; two long-serving interviewees, union interviewees). The Fiji Labor Party (FLP) leader's question below confirms the issue raised by most interviewees:

> The shipyard was telling them all along that they cannot build the ship in the design which was then proposed for less than $[F]15.5 million. It was not the civil servants and it was not the workers. They gave an accurate estimate of the cost of the ship in the form and design and that was $[F]15.5 million. But eventually their arms were twisted to sign the deal for $[F]7.5 million. . . But this was no fault of those who are managing the shipyard. It was the fault of the politicians who interfered (Hansard Report 1996: 2301–2302).

### Discussion/Implications

The theoretical model prepared for this research is supportive of the findings. In the case study, the "principal" was the client/owner – Captain Cook Cruises (Aust.) Ltd. and Qantas Holiday Tours Ltd. The principal's project manager was SDMA. The "agent" was the Fijian Government

while GSPS acted on behalf of the agent as the contractor that built the cruise liner. The government can also be seen as the project manager of GSPS because it was the key decision maker. GSPS cannot thus be noted as the independent agent. The point that Wickramasinghe and Lamb (2002) made in terms of reflexive principal-agent relationship does make some sense here since, when a government acts as the project manager and hands over the project to a public enterprise, the government may appear as the principal, with the public enterprise as the agent.

The contractor, GSPS (public enterprise) assumed the risks associated with the building of the "Reef Endeavour" at a cost higher than the contracted amount, leading to losses from the project. The politicians/government (agent) controlled the contractor by interfering with cost estimates and making major decisions. The goals of the contractor, the agents, and the principals were poorly aligned giving rise to disagreements and even litigation. For instance, the government blamed the owners, for "... inequitable contractual arrangements and misrepresentation" while the owners blamed GSPS for lack of planning and supervision. The agent, the then government, was interested in calling the shots and making the final decision irrespective of the higher cost estimate of the GSPS professionals which maximized the risk for GSPS. The lack of power of the contractors and the control exerted by the agent (government) through the bureaucratic systems and tendering boards cost GSPS. This worked to the disadvantage of both the agent and the contractor in terms of project loss. The arrangement was also rather entangled with the involvement of politicians and SDMA. This finding concurs with Ceric's (2013) explanation of: different parties being involved in projects even before the execution and the existence of potential conflict of interests because of each participant's self-interest. However, unlike the earlier government interference of deciding on the contract amount, the later government actions (seeking additional payments) reduced the loss of GSPS to some extent but this would not have been the case if the contractor's (GSPS) estimates were favorably considered in the first place. This concurs with Roja's (2015) statement of the effects of political pressures being agency specific. The new finding here is – political interference is negative given mistakes of lower cost estimates but the negative impact lessens with later government actions of seeking higher payments, postconstruction. This new finding can be particularly useful in contract formulation in terms of stipulating the rights of all parties concerned, in situations where the project costs may not remain within the contracted amount. The final decision on the contract amount by the politicians/government (agent) placed limits on the contractor (GSPS), reducing the level of its freedom, increasing uncertainty about what GSPS should or can do. Control was further exerted by the clients (principals). This finding is parallel to Ceric's research (2013) in that – both the principal and the agent may exhibit opportunism. The agent – the government exhibited opportunism when asking for an additional $F3.06 million for the ship's release while the principal exhibited opportunism by slapping a penalty of $F650,000, later reduced to $F225,000 for late delivery. This discerns from the common argument of the traditional agency theory that portrays only the agent as the opportunist. The contractor, GSPS assumed majority of the commercial risk and yet did not have the freedom to name its price to the client (principal). The total expenditure amounted to some $22 million while revenue was much lower – $F11.8 million. The divergent interests of all parties resulted in problems related to timeliness and delivery, drawn out legal battles, higher costs, and project loss. The client (principal) was also, no doubt, adversely affected in terms of having to pay more than the contracted amount to obtain the completed project, delayed project completion, and paying for litigation in order to resolve the tiff between itself and the government. This finding is in agreement with Aritua's et al. (2011) explanation of diverse stakeholder aspirations and challenges of multiple project procurement.

And as Kauppi and Raaij (2015) argue, agency problems may not only arise with agents withholding information; principals may also withhold information. While SDMA (principal's project manager) did not withhold information, it

provided inaccurate estimates. The government, despite the higher cost estimates of its own marine experts signed the initial contract for $A7.7 million upon reassurances by SDMA. The principal however did withhold information as it failed to provide specifications of complete designs and construction plans as and when required, leading to delays. This finding in in line with Al-Sedairy's (1994) findings – project conflicts stemming from timing, project concepts, costs, and specifications. The agent (government) was disadvantaged because of its own mistakes or control over the contractors (GSPS) who were more effective in preparing cost estimates. SDMA also went bankrupt and the government was unable to take any legal action for the inaccurate estimates. GSPS ended up completing the project at a higher cost than the contracted amount. The government decided to rescind the contract when it realized that its own taxpayers were subsidizing the foreign tourist vessel. The government chose to believe the SDMA cost estimates, not its own marine experts. This entry accordingly suggests that such contracts be deliberated in rigorous parliamentary debates. In addition, all partnerships or deals should go through proper due diligence by independent committees to ensure that partners are genuine and have the financial and management capabilities. There should also be ongoing periodic checks on new partnerships. To this end, a critic committee comprising the media, NGOs, private firms, social welfare groups, politicians, academics, and unions could be setup to objectively question, carry out background research on probable partners, help in the preparation of prudent deals, and monitor state actions.

Ceric's (2003) finding of poor communication being a common project risk is also worth noting. When the government and the client could not reach amicable solutions, the matter ended up in courts. However, when both parties were open to dialogue, they realized that there was no point in prolonging arguments which helped to sort out the differences.

Furthermore, the complementary view to agency theory presents man as an honest but not fully competent actor (Kauppi and Raaij 2015). In the case study, the contractor was more competent than the politicians in the area of cost estimates, but later, upon realizing the costing mistake, the government did take necessary actions to ensure that it be paid a higher amount which reduced overall losses. Surprisingly, it was the principal's project manager (SDMA) which proved out to be incompetent as it provided with inaccurate estimates. Here government's (agent) incompetency was with respect to having more faith in SDMA than its own marine experts who estimated higher costs – a new finding. This entry suggests that when dealing with clients, thorough checks be done prior to making any commitments. An objective third party should attest (Burritt and Welch 1997) not only the background information on clients but also confirm the estimates. More research needs to be done in the area of governments having more faith in external companies than their own experts.

## Conclusion

The theoretical contribution of this study is threefold. First, the study extended the agency theory to include the contractor (a public enterprise), the government as the agent, client as the principal, and the designer/architect as the client's project manager. This extended model was empirically tested and is supportive of the empirical findings. Second, this model helped to better understand how the involvement of four parties can complicate a construction project in the public sector – this paves the way for the development of even more effective models. Third, this study sheds light on political interference, an issue that has not been given due consideration in many public management studies (Walker et al. 2013). In addition, unlike the earlier study of Ceric (2013), this study reported new findings of agent's (government) interferences and mistakes leading to contractor (public enterprise owned by the agent) losing out, the outcome being negative for the contractor, the government, and even the principal (client). The government also chose to put more faith in the principal's project manager's

estimates than its own contractor's estimates. This matter requires further investigation and findings of future study may bring about a more effective holistic theory. The findings are applicable to countries, construction companies, and public sectors where a government signs the deal and is the key decision maker for public enterprise projects.

## Synonyms

Distributive justice

## Introduction

The relation between justice and public policy is reflected on the ability of governments to act inclusively, efficiently, efficaciously, and effectively, considering the ethical perception of society regarding institutions design and performance. Inclusion, efficiency, efficacy, and effectiveness serve as parameters that guide citizens' judgment on the performance of public policy and public administration as a whole. Political injustice takes place when institutions are permeable to power structures that lead to exclusion, inefficacy, and ineffectiveness. Political injustice in public administration is mainly triggered when the principle of equality is corrupted in public policy.

The debate on justice and public policy lays on the administration's capacity to add public value and be effective in its governance approach. Thus, political injustice is a normatively dependent concept, related to citizens' judgment on the justification and implementation of norms and values for governmental public action's assessment. Such judgment shall inform that a public policy is legitimate or illegitimate, based on ethical principles of inclusion, efficiency, efficacy, and effectiveness. That is, if a public policy is aligned with the public interest or if it reproduces exclusionary power structures. Public communication is central in this process, since it represents institutions' ability to promote public value, which will guide citizens' opinion about public policies.

The debate on governance argues that interaction between state and society must be considered in public administration's planning, so it can ensure mechanisms that enhance the quality of public policies and services as well as the quality of the political regime in which management operates. More than problems of public institutions, the concept of governance also considers the problem of public action, in such a way that the administration is limited not only in the aspect of management but also of politics (Rhodes and Bevir 2016).

Nowadays, democracies have been composed with citizens that are more critical to the action of governments. Such criticism has raised a wave of protest and demand for change in terms of management mechanism and political regime (Norris 2011). Increasing distrust in political and administrative institutions, broadening perception of corruption in managers' and large public enterprises' actions, as well as coordination problems and misinformation would be recurrent problems in democracies and that directly affect institutions (Dalton 2004; Hardin 1999; Klingelmann and Fuchs 1995; Levi 1998; Offe 1999; Pharr and Putnam 2000). There would be, in this sense, new demands to the public administration aligned with citizens' critical position in relation to democratic deficit of institutions, unrelated to social justice (Norris 2011). In other words, political injustice increases distrust in institutions and public policies, considering citizens' judgments justified by their exclusion from the decision-making process and by governments' poor results.

The idea of democratic deficit is related to citizens' high suspicion on institutions and a growing perception of public administration malfunction. The offer of public goods and services is hampered by inefficiency, inefficacy, and ineffectiveness of public policies, heavily bureaucratic archaic public services, lack of trained and qualified civil servants, systemic corruption, and public management models that do not allow the administration to add public value and to deal with its connection to the political system.

Therefore, it is the legitimacy of public action in society that announces the relationship between public administration and injustice, focusing on

inclusive and democratic values. Political justice is a parameter for judging public policy's inclusive capability and results. In contrast, political injustice comes from excluding power, which promotes inefficient, inefficacious, and ineffective results, out of ethical parameters.

## Framework of Justice and Public Policy

The debate on justice holds a broad traditional thinking. Theories on justice may vary from justice as transcendent institutionalism to justice as social accomplishment (Sen 2009). On one hand, justice is the set of principles that provide the correct choice of institutions. These principles have transcendental shape and guide society to the best possible choice of political and legal institutions for the realization of principles (Rawls 1993; Dworkin 1985; Nozick 1974). Principles must be justified in the light of a public reason that commands and guides governmental actions. The perspective of justice as social achievements, on the other hand, seeks to observe injustice in society's plan compared to social behavior criteria. However, the purpose of justice should not be focused on a dichotomous and antagonic treatment of these two perspectives, which should be combined to form a more complex framework. A valid conception of justice must account the right institutions and the right behavior, considering the values and norms set by principles (Sen 2009).

Justice is directly related to principles, which are brought to public discourse as argumentative resources for public action's evaluation. Public policy's public character depends on how government action can be justified, institutionally, having the constitution as a guide, or based on results, providing social achievements.

Within the scope of transcendental institutionalism, democratic society is governed by the principle of pluralism. Pluralism means that democratic societies build extensive and different moral, philosophical, and religious views, which prevent any kind of public interest based on social achievements, because any social achievement of a group will lead to the exclusion of another one. The transcendental character of the institutions lies in the fact that a democratic society is based on the production of an overlapping consensus on principles of justice. Overlapping consensus produces a tolerant society on the condition that citizens are reasonable and respect the difference principle (Rawls 1993).

In this sense, the origin of principles of justice demands a contractualist conception centered on the problem of validation. Validity is set up through consensus on principles that can be endorsed by everyone, regardless their moral, philosophical, or religious views. Legitimacy issues are limited to the constitutionality of laws as well as government and citizens' political actions. The exercise of power is legitimate if it is exercised according to a constitution, which is fairly endorsed by free and equal citizens (Rawls 1993).

Institutions shall establish policies and actions for the sole purpose of achieving the principles of political justice set out in a constitution. To be fair, public policy needs to be neutral from the point of view of their justification – not their results – because the bond to the conception of the good means the violation of the difference principle. Justification's neutrality is essential to validate policy established by the state and its agencies, bearing in mind valid institutions. As plural societies have no agreement on goods, the best judgment is the one that expresses first-order impartiality. Therefore, it limits the concept of public to constitutional precepts (Rawls 1993).

Constitutional principles justify administrative public action by rules that recognize citizenship equality. The equality principle requires the state to consider and treat its citizens as equals (Dworkin 1985). Public policies based on equality and on *rule of law* point to the following principles: (1) the government should not impose restrictions or sacrifices on any citizen based on an argument that the citizen would not be able to accept without abandoning his sense of equal value and (2) liberalism based on equality requires an economic system in which no citizen has less than an equal share of community resources just so that others can have more of what is lacking (Dworkin 1985). In the light of the principles of

transcendental institutionalism, public policy is fair on the condition that it is justified in accordance with the principles established by a constitution.

With regards to the concept of justice as social achievements, judgment does not take place based on transcendental principles. Deontological concepts of justice fail for assuming ideal models that are sustained in the empirical world (Walzer 1975). It is impossible to think of a person existing without being involved with his community and his ethical life since his faculty of the mind is based on values that are common and have a broader social meaning. The idea of justice is so complex that it has different significations in plural societies, depending on the context and on the group under discussion. A universal concept of justice that generates principles able to organize and formally order society is unlikely. Ordering depends on the search for deep structures of society, which are marked by common community values. Without ethical life, which generates values and deep structures of society, it is not possible to find meaning to the idea of justice, since it is connected to the fundamental loyalty that one has to others. Criticisms to transcendental institutionalism recognize diversity as the landmark of contemporary democratic societies and the need to recover ethical life to think public action. These criticisms are based on community and culture concepts as the basis for policy, taking into account a context of new social movements and their struggle for recognition (Taylor 1992). Thus, social achievements concept considers that citizens' judgment on public action justice is based on identities and philosophical and moral concepts of the world.

Justice in public policies, therefore, takes place on two levels: (1) in the political justification level, considering a free decision-making process that is able to equally include citizens and (2) in the policy implementation level, according to results that include and recognize citizens' diverse interests, opinions, and perspectives. With regards to inclusion, justice in public policy takes place in the decision-making process and in the public action's results. Regarding efficiency, justice in public policy takes place when scarce resources are optimized. Finally, as to effectiveness, public policy justice takes place when public action can ensure improved services and equitable and effective results.

## Political Injustice, Corruption, and Governance

Political injustice occurs in public policies when governmental action is assessed by citizens based on justification and implementation problems. Regarding the justification level, public policy is unfair when its ground of validity excludes the principles of freedom and equality. That is, when citizens are not free to choose the governmental action flow and when there is no equal concern and respect for diverse interests in public action. In terms of implementation, public policy is unfair when its results do not recognize and exclude the community's diverse interests, opinions, and perspectives, promoting society resource deprivation.

The main cause for political injustice in public policy is corruption. Democracy, as an ideal norm, is the political regime in which the ones affected by public decisions can manifest against those decisions (Habermas 1996). Corruption is a process of citizens' unjustified political exclusion from institutions and social achievements. Corruption means illegitimate and illegal private appropriation of public funds. Its immediate outcome is society's privation of power and deviation in resource distribution. Therefore, corruption assembles varied forms to act against public interest and it is manifested by moral judgment (Filgueiras 2008).

Being a normatively dependent concept, moral judgment, which specifies and defines corruption, depends on the law justification and implementation process, within public communication. Thus, corruption is a form of political injustice, which takes place in two levels: the institutional level and the social achievement level. Corruption is directly related to inequality, since it results in democracy institutions' malfunction and agents' misbehavior, promoting organizations and public administration resources privation. In relation to

institutions malfunctioning, corruption decreases the value of equality before the law, causing political exclusion (Warren 2005). Institutional malfunctioning results in one-sided distribution of society's economic resources, increasing inequality. That is, corruption directly affects social achievements by distributing society's resources unequally.

Corruption, as the ultimate expression of political injustice, since it results in political exclusion and reproduction of inequality, directly affects the quality of democratic government. Corruption jeopardizes the public communication process and directly affects the legitimacy of the political system and of public policy. In that sense, corruption is the breakdown of the political system legitimacy, as it means producing forms of exclusion in democracy.

Facing political injustice stems from democratic governance improvement. Public administration must grant new ways of power exercise in order to promote inclusive public policy, which means more effective, efficient, and effective. It must ensure ethical mechanisms of power exercise and institutional innovation processes marked by citizens' participation, solid management tools, transparency, and accountability. Democratic governance is the administration model that is open to public and delivers services and policies for citizens. Democratic governance goes beyond management, for the quality of public services is relevant for citizenship. Democratic governance means administration *in* public, for which, in addition to efficiency and effectiveness, state action legitimacy matters, considering public service and policy that promote equity and add public value to state action (Bevir 2010). Democratic governance brings together three elements that count up to public administration: (1) state capacity for implementation and coordination; (2) transparency and accountability mechanisms (Filgueiras 2016) and; (3) mechanisms for political participation (Fung 2015).

The concept of democratic governance is enclosed with the notion that government quality matters. Quality implies the ability to act and produce equitable results to society as a whole. It means not being permeable to corruption, being able to exercise full legitimate fair public authority (Rothstein 2010). Strengthening public sector's mechanisms for management and democratic governance allows for more inclusive institutions and results, which makes it possible for public policy to be immune to injustice and be paired up with ethical standards.

# Political Leadership

Michael Johnston
Charles A. Dana Professor of Political Science, Emeritus, Colgate University, Hamilton, NY, USA

## Synonyms

Political authority; Political initiative; Political popularity

## Definition

A mutually recognized relationship between an individual or a small group, on the one hand, and a larger number of followers, sustained by transactional linkages with followers, enabling the leader(s) to persuade, set goals, and urge or discourage actions in ways that the followers do not ignore.

## Introduction

Leadership is an essential component of mass politics, public policy formation and implementation, nation and state building, conflict, and warfare, among a number of other concerns, yet the concept remains somewhat ill defined (for general analytical perspectives, see Blondel 1987; Edinger 1967; Elcock 2001; Jones 1989; Kellerman 1984, 1986; Paige 1977). During the first half of the twentieth century, perhaps in response to the rise of both democratic and undemocratic leaders enjoying considerable mass popularity – or at least mass followings and acquiescence – leadership was the focus of extended academic discussion. More recently, as interest has shifted toward grassroots politics, political psychology, the ways in which power is to be restrained rather than used, and the role of communications media, leadership has faded as a research focus. Indeed, in recent decades statements about the essence of leadership have tended to come more in the form of aphorisms on business motivational posters, or laments about the decline, absence, or poor quality of political leadership, than in the form of tightly argued definitions and analysis. At the same time, few would deny that leadership is a meaningful notion, or that it is a needed and valuable quality in politics, organizations, and society at large.

## Complex and Varial Relationships

Most conceptions of leadership involve a relationship between leaders and followers – after all, a would-be leader with no followers is of little importance – although some may also dwell upon various qualities of the leaders themselves, such as background, appearance, rhetorical and persuasive skills, moral standing, and so forth. Collective leadership in various forms is encountered fairly frequently, but most views of leadership itself emphasize an individual leader.

Let us, for the sake of argument, define leadership as a mutually recognized relationship between an individual or a small group, on the one hand, and a larger number of followers, sustained by transactional linkages with followers, enabling the leader(s) to persuade, set goals, and urge or discourage actions in ways that the followers do not ignore.

That very general definition would exclude purely coercive relationships (although some varieties of leadership may have coercive elements or include the threat of coercion). It transcends fame or popularity, in that the ability to influence followers' beliefs or actions is a central element of leadership but – while it may be a by-product of sorts – does not necessarily accompany or flow from fame or popularity themselves. It also differs from Weber's (1958 ed.) classic typology of types of legitimacy or authority (legal, traditional, and charismatic) in the sense that the latter may be properties of an institution, regime, or a system of interactions, as well as of a leader, and that any of those forms of authority might exist without necessarily having consequences for followers' behavior. Further, while those in positions of authority may be able to exercise leadership, it is easy to imagine a top figure in an insurgent movement who exercises considerable leadership with respect to that movement, yet does not possess broad social authority.

The tortured nature of the qualifications above illustrates a few of the reasons why leadership can be hard to define and why it may be more apparent by its absence than in some of its less dramatic, and effective, manifestations. The notion of influencing followers' behavior can be fraught with logical difficulties: we might attribute mass behavior to the presence and appeals of a leader, but how do we know what the followers might or might not have done in the leader's absence? Similarly, it is possible, even common, for a leader to take credit for outcomes that likely would have happened anyway or for mass beliefs or behavior that have other origins.

For that reason it is important to understand what leaders and followers offer and derive from their relationship and what sorts of resources leaders depend upon to maintain their position. While there is no agreed-upon typology of such forms of leadership, several types (as opposed to personal "styles") might be worth pointing out. At various points, some of Weber's themes will be evident here as well; and it is important to note that many cases of leadership will likely display more than one of the following characteristics.

Some forms of leadership, even though they involve relationships with followers, are less transactional than others. *Autocratic* leadership revolves around obedience of an individual (who may possess other leadership qualities as well). Often the specific threat or mere implication of coercion will be fundamental to the autocrat's role. Followers, for their part, may derive the not inconsiderable benefit of avoiding such coercion, as well as a measure of derivative prestige that flows from identifying with, or being identified with, the autocrat.

*Bureaucratic* or rule-oriented leadership will depend upon the formal duties, functions, and powers of a leadership role, as well as upon a range of rewards and incentives that are normally dispensed through that bureaucracy (Egeberg and Trondal 2009). The rules and roles underlying bureaucratic leadership may specify extensive obligations, limitations, and entitlements for both leaders and followers and are not normally dependent upon the identities or personalities of individual leaders or followers. Much leadership in business and public administration exemplifies this category.

*Charismatic* leadership (Friedrich 1961; Willner 1968, 1985) rests critically upon emotional and symbolic relationships between leaders and mass followers. Unlike bureaucratic leadership, for example, the loyalties sustaining charismatic leaders attach to the person of the leader, rather than primarily to an office or a broader system of authority. "Charisma" is a term that has been much debased by overuse regarding what ordinary political leaders ought to offer. But the linguistic roots of the term, referring to one who has been anointed by God, give a clearer indication of the power (and rarity) of genuinely charismatic leadership. Such leaders may symbolize the shared identity, hopes, or resentments of a whole people and may even be seen by some as divinely chosen; in most instances they are highly skilled at the uses of language (Shamir et al. 1994) and symbols. The charismatic leader derives immense popularity – but may also be the focus of immense expectations – while followers receive emotional gratification, the opportunity to identify with an exceptional figure, and mutual

reinforcement from other followers. Again, no consensus list of charismatic leaders exists; some have been accorded a kind of post hoc charismatic status after their death (e.g., John F. Kennedy, who during his lifetime was a popular but not wildly acclaimed, nor exceptionally effective, president). Better examples might be figures such as Gamal Abdel Nasser or Rev. Martin Luther King, Jr.

Closely related to charisma is *demagogic* leadership. The demagogue, again, inspires intense emotions and is usually adept at using words and symbols to mobilize them in followers. But unlike the charismatic leader who inspires followers, a demagogic leader is more likely to use them, directing their emotions at some common enemy or scapegoat, or diverting attention from more immediate problems. Because leaders in mass electoral systems often find it useful to be very general about what they support and very specific about what they oppose (A notable exception was Lyndon Johnson who, at the end of a long day of campaigning in 1964, proclaimed "I just want to tell you this – we're in favor of a lot of things and we're against mighty few." "Lyndon Johnson quotes" 2016), some elements of demagoguery may surface in otherwise healthy political processes, or at least charges of demagogic appeals may be frequent. But the true demagogue has malign intent transcending electoral advantage alone: Adolph Hitler's targeting Jews as the source of Germany's problems and resentments, or (in less extreme ways) contemporary politicians who cast immigrants in similar roles, show both the power and the negative potential of demagogic leadership and the essential role of mass response in this – as in any other – leader-follower relationship.

*Consensual* (or first among equals) leadership rests upon agreements, implicit as well as formal, and upon sustained trust among a number of participants in a managerial or decision-making process. The late Harold Wilson, twice prime minister of the United Kingdom, likened his leadership style to that of a sweeper or midfielder on a soccer football team – deploying people and tasks and then coordinating effort and resources to maintain a smoothly functioning government. A consensual leader may indeed have a personal agenda or set of goals, but consensus building (and maintenance) is central to this variety of leadership.

*Nationalistic* or *identity-based* leadership casts the leader as the embodiment or chief representative of a group's or nation's being – in effect, as exemplifying "us" as opposed to others. Depending upon the social composition of a nation or community, such leadership can be a strong unifying force, or sharply divisive; similarly, such a leader might mobilize followers toward positive goals, or derive credibility and power by skillfully articulating the group's resentments. Times of crisis, or of major political transition, seem particularly likely to bring such leaders to the fore. Vaclav Havel was a positive example of such a leader; more negative examples abound in dictatorial regimes.

Some leaders build a following by buying it. *Patronage-based* or *patron-client* leaders recruit followers by making it worthwhile for them to get behind the leadership. Political machine bosses offered their followers a range of favors, and in some cases local government jobs, in exchange for their loyalty and political work at the neighborhood level. Their support, in turn, helped the boss win elections and maintain control of the sources of patronage. At times patronage-based leadership is portrayed in benevolent terms, but in fact it was aimed at maintaining a political monopoly; poor and working-class followers were not so much mobilized on behalf of their own interests as controlled in the service of the boss. Once in power, patronage-based leaders can be difficult to unseat by routine political processes, as their political monopoly makes it difficult for would-be competitors to build followings of their own. If they are ousted, it will more likely be via legal or other interventions from without – or because they have allowed their organization to "age" and get out of step with changes in the wider community.

*Social* or *network-based* leaders enjoy a status and degree of prestige that reflects personal popularity. There are parallels here to the consensual leaders noted above, but leadership in this category is likely to be more informal and social, drawing upon and reinforcing social capital rather

than revolving around official roles and responsibilities. Many neighborhoods have a long-time resident, or a handful of them, whose prominence and local knowledge mean they are sought out for help and advice. Prominent local business people, educators, or clergy may also play similar roles. The reciprocities involved in such leadership may resemble those in a patronage organization, but followings are not disciplined or controlled, are unlikely to face any real competition, and are held together more by a sense of good will than by the systematic giving or withholding of rewards. Nonetheless, when a community problem surfaces, social leaders may well lead the way in organizing a political as well as social response.

*Symbolic* or *figurehead* leaders are known to all in a community or society, and while they exercise little or no formal power they can be powerful unifying influences. The classic example is Walter Bagehot's Queen Victoria (and similarly, today's Queen Elizabeth II) in the United Kingdom: as Bagehot made clear, the sovereign "reigns but does not rule." Indeed, in his analysis the symbolic power of such figures depends upon their remaining above and apart from the day-to-day political fray. The symbolism involved can be of many sorts – patriotic, religious, historical, military, cultural, and other themes may be intertwined in complex ways. While the power and durability of such symbolic appeals should not be underestimated, they are potentially fragile and open to disruption; Bagehot famously warned against parliamentary inquiries into the monarchy by saying that "we must not let in daylight upon magic." Still, symbolic leaders may at times influence government or management in subtle ways or, by example; Queen Elizabeth is widely believed to have influenced the conservative party's choice of a leader (and thus of a new prime minister) in 1963 by quietly backing Alec Douglas-Home behind the scenes.

A final variation on leadership would include leaders or would-be leaders operating from a stance of dissent or criticism of the established order. Here we might include insurgents (political or military), whistleblowers, gadflies, scandalmongers, or campaigners for various causes, so long as they have discernible popular recognition. As they generally exist and act outside of mainstream institutions and dominant leader-follower relationships, such leaders may be weak and their careers short lived. But if they can capitalize upon a crisis, widely held resentments, exceptional moral standing, or the unpopularity of established leaders and regimes, and if they can build a following sustainable for the long run, such leaders can play major, even transformative roles. Mohandas Gandhi in India, Fidel Castro in 1950s Cuba, and Lech Walesa in 1980s Poland are examples of differing sorts. Here again, such leaders will be more successful if they can make use of some of the other appeals (charismatic, patron client, nationalistic) noted above and if they can offer diverse appeals to a range of constituencies and followers.

## Conclusion

The varieties of leadership outlined above can overlap in many ways; indeed, highly effective leaders may simultaneously appeal to different constituencies in quite different ways. Each can be overlaid by the personal styles of particular leaders or strongly shaped by widely shared emotions and expectations on the part of followers. Collectively, however, they illustrate the variety of relationships that can arise between leaders and followers. Leadership can also be shaped by the distinctive needs and agendas of the leaders themselves – a "need for power"; a drive for wealth, popularity, or love; a desire to make a mark on history; or to avenge various personal or group slights, defeats, and deprivations may all drive individuals to seek leadership roles and to build followings.

Political leadership can differ from other varieties in terms of its formal sources of authority and of the types and extent of accountability to followers and wider publics that may be involved. It is distinctive in those respects from, say, corporate leadership. Leadership roles and powers can be abused – lying and corruption are examples – if leaders use their power and prestige in self-serving ways. Narcissism, in the popular senses of the term, may also arise if leaders use the

prestige, power, and resources of their positions to build up their self-image or reputations, rather than to maintain the transactional relationship (whatever it may be) with followers. Particularly where mechanisms of popular accountability are strong, a leader who "wants to be something rather than do something" may quickly deplete his or her fund of legitimacy and good will.

## Synonyms

Gender gap; Gender inequality; Gender inequity; Political leadership; Public headship

## Definitions

**Political Leadership**: Holding of public office or serving as a political representative by means of election or direct appointment.

**Gender**: Formalized social identities and practices affecting interactions between men and women in modern/contemporary societies; a historical and cultural concept that opposes the idea that differences between men and

women can be defined in strictly biological terms.

**Gender inequality**: Disparity between the legal rights and experiences of men and women (in their roles as human beings, producers, consumers, family members, subjects of law, etc.); a historical legacy of patriarchy, it is still prevalent in all modern societies.

## Introduction

Contemporary Western democracies have, to a large extent, consolidated the constitutional assumption of legal equality for all citizens. Nonetheless, the development of modern democracies has also been accompanied by a perception that the legal enshrinement of equality in law does not necessarily assure equal rights in fact. In other words, there is a general perception that despite the existence of constitutional and legal tools designed to ensure modern equality, a number of inequalities still persist; which points to a gap between how society is conceived in the law and how it is experienced by its citizens.

When men and women receive unequal treatment – in law and in daily life – it is referred to as gender inequality. This form of inequality has inspired a range of reflections in different contexts around the world about how to foster equal rights and opportunities for men and women alike. Yet despite these efforts, even in the twenty-first century, men and women still experience unequal rights and access to social goods, indicating that many challenges still need to be addressed to reduce the distance between equality under the law and the reality experienced by citizens. Such situations of gender inequality are often described as the gender gap.

The underrepresentation and limited participation of women in decision-making processes and institutions are two of the most important consequences of gender inequality, especially in democratic societies. As such, this entry explores the problem of gender inequality in politics, addressing the following questions (Glatte and de Vries 2015): If women account for almost half of the world's population, why are they a minority in leadership positions, particularly in the political arena? What are the possible causes of the slow and limited progress towards the full participation of women in public democratic life? What measures have been taken around the world to confront these issues?

## Women as Political Leaders

Leadership is a very broad notion that has different connotations depending on the field of knowledge. The concept of political leadership is more restricted, referring specifically to the sphere of institutionalized politics and government (e.g., Inglehart and Norris 2003). It has to do with people's effective and ongoing participation in the institutional dynamics of representation and deliberation – voting, being voted, holding public office – in the full exercise of their political rights.

Until the late 1970s, analyses of political leadership in the political and institutional life of governments and political parties did not focus particularly on the presence of women in the rank and file of political parties, unions, or civil services or in positions of power. This began to change towards the end of the twentieth century with the upsurge of women's rights movements in the United States and Europe (e.g., Jaquete 1997). Since then, "advances for women" have been discussed openly among scholars and politicians, especially "in the areas of access of education, health care, and reproductive services, as well as human rights," basic preconditions for access to political life (Inglehart and Norris 2003, p. 129).

By contrast, however, studies of women's participation in institutional politics and government only gained ground later (ibid., p. 129). It was only in the 2000s that discussions about women in political leadership led to the development of research agendas focused specifically on the study of the trajectory of women's representation in different branches of government (e.g., Jones 2009; Piscopo 2010; Schwindt-Bayer 2010; Htun 2016). Such studies focus on women's access to political representation from a historical perspective and its role in promoting gender empowerment.

## Gender Political Inequality

Gender is a term that generally refers to formalized social identities and practices affecting interactions between men and women in modern and contemporary societies. It is a historical and cultural concept that opposes the idea that differences between men and women can be defined in strictly biological terms (Scott 1986, p.1067). Gender relations therefore permeate the entire social life of a community and connect with other factors to compose a structured fabric of human relations.

Each gender is not made up of a homogeneous group of people, as there are natural overlaps with other social groupings and identity markers, such as class, race, ethnicity, religion, sexuality, and age. Nonetheless, gender of itself often connotes certain social roles that generally place women at a social disadvantage and often expose them to violence.

Gender inequality is particularly marked in political leadership. According to the Inter-Parliamentary Union, in June 2017 23.6 percent of all national parliamentarians were women (World Development Indicators 2018). This number may look low, but from a historical perspective it actually represents huge progress. (Nine percent of all national parliamentarians in 1987 were women. By 1995, this number had risen to 11.3%, and reached 14.3% in 2002.) In the words of Jane Jaquete, the growing participation and representation of woman in politics is "one of the most remarkable developments of the twentieth century" (Jaquete 1997, p. 23). Likewise, in October 2017, 11 women were serving as heads of state and 12 were serving as heads of government around the world, as opposed to just nine heads of state or government in 2003 (Inglehart and Norris 2003, p. 129). In 2016, there were just 38 states around the world where fewer than 10% of the parliamentarians in their single or lower houses were women, including four that had no women representatives at all. In 2001, there were over twice as many states (82) with such a low participation of women in the lower house, and only 27 states had over 20.7% female parliamentary representation (with none exceeding 42.7%!).

These are just a few examples that demonstrate a recent narrowing of the gender gap in political leadership around the world. However, they also reveal that political leadership is still overwhelmingly male-dominated. According to the *Report on Equality between Women and Men*, produced by the European Commission in 2008, women are still a minority in positions of responsibility in politics at all levels of representation and government in the countries of the European Union (European Commission 2008, p. 8–9).

In 2001, it was estimated that if women's participation in politics continued to grow at the same rate (0.36% per annum), parliamentary gender equality would only be achieved in the turn of the twenty-second century. Over 15 years later, the *Global Gender Gap Report* of 2017 (World Economic Forum 2017) estimated that time needed for gender parity, based on the pace of current advances, was even longer: 217 years. In other words, the gender gap would only be closed in the turn of the twenty-third century. When progress is made in combatting gender and political inequality, the danger of a backlash should never be underestimated (SDG Fund 2017).

## Barriers for Gender Equality

Throughout the world, research demonstrates that women continue to be underrepresented in positions of political leadership, although in these same surveys their effective participation in the rank and file of political organizations is evident. This begs a fundamental question: What is preventing the empowerment of women leaders in democratic institutions?

Inglehart and Norris (2003) point to a combination of three key "barriers" to the rise of women in politics: structural, institutional, and cultural. *Structural barriers* are related to situations where certain conditions in the social system (occupational, educational, socioeconomic status) are decisive in hindering or impeding women's access to political office. They are very common in developing countries, where poverty and limited access to education and health care affect entire

generations of children, particularly girls. Yet this kind of barrier alone cannot explain situations where societies at the same level of development have clear disparities in the inclusion (exclusion) of women in (from) positions of political leadership (e.g., Canada versus the United States or South Africa vis-à-vis Nigeria).

In these cases, it might be worth exploring, for example, the role of *institutional barriers* in preventing more women from holding positions of political leadership, especially the tendency for path dependence to reinforce male power in political parties, the selection of male candidates, etc. Many studies in this area have prompted calls for proportional representation and the introduction of quotas for women in political parties' internal recruitment processes. These measures, which are more accepted nowadays, would help correct the flaws in the "rules of the game" and promote gender equity within democratic competition. Another factor affecting women's access to political leadership positions is the level of democratization of the institutions in their countries, since inequality can only be fully redressed by expanding civil liberties and rights, strengthening political parties, and opening and institutionalizing political recruitment procedures (ibid., p. 132).

However, like structural barriers, institutional barriers do not of themselves explain why countries that adopt similar measures to boost the institutional inclusion of women in politics often obtain divergent results or why women with a similar socioeconomic status in the same institution will have widely diverging opinions on the need for the greater inclusion of women in politics (e.g., Cole et al. 1998).

To attempt to complement the study of the causes of gender inequality in political leadership, Inglehart and Norris (2003) then propose the existence of *cultural barriers*, which are linked to the diffusion (or not) of certain traditional values concerning the place of women in society and in the political community. In particular, societies where family values and domestic life are particularly important tend to impose barriers on the entry of women into public political arenas. Cultural barriers explain, moreover, why in certain societies women are able to rise to a certain level of political leadership but are prevented from advancing further (ibid., p. 134). The achievement of gender equity in political leadership could be hampered just as much by traditional attitudes towards women as by socioeconomic status or the political rules of the game.

## A Permanent Challenge

The persistence of gender inequality in political leadership is a quandary that has attracted the repeated attention of scholars (Glatte and de Vries 2015). As we have seen, although each region and country has its own particularities, historical data show that gender inequality of access to and permanence in positions of political representation and government is still a major issue in democracies across the globe. It is a cross-cutting issue involving multiple hurdles of an economic, institutional, and cultural nature that make it harder and more costly for women to rise to and hold political leadership positions than men. Addressing this problem means working simultaneously on different fronts.

One possible front for action is the recognition that gender inequality is a problem of social justice, encompassing society as a whole, and that this is a fundamental agenda for the development of societies engaged in democratic values. At first sight, this recognition may seem simple, even consensual; however, a real commitment to this issue calls for the scrutiny of complex social relations beyond the abolition of the formal barriers that have prevented (and in some cases still prevent) the access of women to public office, while also facing up to economic, cultural, and subjective issues linked to gendered socialization, sexual division of labor, and the social construction of politics as a male sphere. Once this issue is recognized as a problem, action must be taken.

Since the 6th United Nations Conference on Women, held in Beijing in 1995, the adoption of affirmative action policies has been recommended in order to increase the number of women in representative positions. The question

of quotas for women in the composition of representative houses is not simple, especially when it comes to deciding what models to adopt. When the problem of access to political leadership is extended beyond gender to encompass other important identity markers, such as sexual orientation, race, class, and education, its complexity is only compounded.

In addition, researches have shown that expanding the presence of women in positions of political leadership does not necessarily mean strengthening the agenda of gender equality (e.g., Htun and Power 2006, p. 83–84). Party structures must also be changed if gender inequality is to be effectively addressed, since women often feel less qualified to seek office than their male counterparts (Fox and Lawless 2011, p. 59). Research findings indicate that women's self-perception and perceptions of gender inequality are anything but homogeneous, and that providing them with formal access to certain positions of political leadership will not necessarily lead to greater political autonomy or deliberative power across the board. (e.g., Fox and Lawless 2011).

The limited presence of women in positions of political and state leadership does not, however, mean that women are not politically engaged. On the contrary, as we have seen in this entry, it is the result of an imbalance of influence caused by gender in conjunction with other important factors such as class and race. There is no consensus and no single answer to the question of how to bridge the gender gap, but the data presented here indicate that there is still a long way to go in terms of understanding the issues and designing and implementing practical and symbolic measures to bring about greater gender equality. It is not something that affects just a small group of society, but is intimately linked to the success of our democratic institutions and societies into the future.

## Definition

Political vigilantism, otherwise referred to as *"footsoldierism,"* refers to the resort to, and the use of illicit mechanisms to advance and realize parochial political goals.

## Introduction

Ghana's attainment of Independence from British colonial rule on 6 March 1957, the ensuing slump into a 24-year military rule, and its subsequent resurgence onto the path of democracy has made it an oasis of hope in matters of democracy and governance in Africa and the developing world. To this end, corporate governance within the precincts of Ghana has undergone a monumental sea change since the initiation of democratic reforms. Among other things, the consolidation of democracy, and the entrenchment of liberalization and its tenets thereof, has engendered significant inroads including, but not limited to, extending rights to citizens to participate in the governance process by way of voting, having the right to belong to a political party, and the right to freedom of speech, which guarantee individuals the liberty to engage in sociopolitical discourses (Gyimah-Boadi 2009).

The stable political climate, which has supported the successful organization of series of elections spanning from the first in 1992, to the most recent in 2016, provides sufficient incontrovertible evidence to this assertion. In essence, these elections have markedly made a peaceful transition of political power from one leadership to the other. In spite of the enviable successes and monumental achievements chalked (Debrah 2016), there is however an unfortunate political culture gradually creeping into the political dispensation of Ghana fourth republic. This unfortunate development, which has become known as *"political party vigilantism"* or *"footsoldierism"* has the tendency to erode the years of painstaking and enervating successes chalked, while weakening the strongly laid democratic foundations.

Within a broader generic context, vigilantism could be conceptualized and conceived as an informal security structure or arrangement, which groups or individuals subsist on, as a reliable source of protection toward the advancement of pursuits within the broader context of group/party interest (Gyampo et al. 2017). Political party vigilantism principally entails the use of a wide array of violent and despicable mediums like dissidence, resistance, and other legally unapproved measures (Nivette 2016) by an illicitly constituted group. Given the insecure and dangerous approaches employed in the undertakings of vigilante groups, vigilantism has been one of the grave deficits in democracy practice (Asamoah 2019).

Concerning political party vigilante or foot soldier activism in Ghana, the key actor culprits include the two major political parties: the New Patriotic Party (NPP) and the National Democratic Congress (NDC). The preoccupation of these groups is anchored on preserving the interest of their political parties – for example, providing security for party activities and leadership (Bob-Milliar 2014). At this juncture, it is instructive to emphasize that these groups do not emerge out of the blue. There are possible and plausible factors underpinning their formation and

mushrooming. So, what exactly informs the decision of people to engage themselves in vigilante activities? What drives the intention of people to subscribe to vigilante groups? These constitute the questions we seek to answer in this study. As much as vigilante groups help advance both personal and political party courses, their activities could equally impair national development, and the overall democratic process.

Essentially, there have been prior seminal studies exploring the phenomenon of vigilantism in Ghana. In a qualitative study, Gyampo (2010) explores the activities of political vigilante groups within Ghana's body politic. In another seminal study, Gyampo et al. (2017) further explore the activities of vigilante groups in advancing not only the course of their affiliate political parties, but also, their debilitating effects on the entire political and democratic governance system in Ghana. In a more recent qualitative study, whereas Asamoah (2019) extensively discourses on the pervasiveness of party vigilantism as an ignoble element of governance in Ghana's Fourth Republic dispensation, Bjarnesen (2020) also treatises on the menacing activities of vigilante foot soldiers in relations to democratic governance, precisely elections.

In view of the aforementioned prior studies, it is however obvious that there is no empirical study investigating the underpinning factors of vigilantism in Ghana. Against this backdrop, our study seeks to fill the lacunae in extant research literature by investigating the potential push factors of vigilantism. Overarchingly, and more concretely, the purpose of our study is to empirically inquire into social, economic, and political factors underpinning vigilantism in Ghana. An empirical study of this sort is crucial for effective policy intervention. Until a clear examination and understanding of the complexity of the phenomenon, efforts exerted toward addressing the canker may be cast in chimera.

The uniqueness of this study lies in its empirical approach. To the knowledge of the authors, it is the premier groundbreaking empirical studies that sets out to investigate party vigilantism in Ghana. Our study contributes to literature by expanding the scope on vigilante studies, proposing and verifying a theoretical model within the context of behavior. The proposed model would not only foster an understanding of the nomological relationship between constructs, but also, would help identify factors (in order of hierarchy) likely to drive vigilantism. Overall, the findings of our study would provide sufficient empirical pointers to guide the deployment of measures targeted at fighting the phenomenon, while contributing to strengthening and consolidating Ghana's bourgeoning democracy.

The remaining part of the chapter is structured as follows: the next section discourses on the historical trajectory of political vigilantism. The "theoretical underpinning of the study" section covers the theory, research model and proposed study hypotheses. The "research methodology" section covers the study approach employed. Results of the study are captured in the "data analysis and results" segment. The broader study discussion is presented in the "discussion, conclusion and recommendations" section. The final part covers the study "implications and limitations."

## Vigilantism and Footsoldierism in Ghana: Historical Trajectory – Past to Present

The trajectory of political vigilantism in Ghana could be traced to the precolonial era when the struggle for self-determination from British colonial rule had assumed a more ruthless dimension. As a countermeasure to overcoming the overbearing British colonial masters who had overtime unyielded to the demands of the people of the then Gold Coast, now Ghana, the people organized themselves into groups, with the ultimate goal of throwing British rule into disarray while expediting the independence process. This situation culminated into the opening of the floodgates of political activism in Ghana. Key among these initiatives precipitated the formation of a youth group (The Veranda Boys Movement) by Kwame Nkrumah of the Convention Peoples Party (CPP) (Paalo 2017). On the basis of the politically charged atmosphere, the struggle for independence received an impetus when three of the

protesting disgruntled ex-service men (Sargent Adjetey, Corporal Attipoe and Private Odartey) who had fought for Britain in the Second World War were shot at the Christiansborg cross at an event which later became known as the 24 February 1948 disturbance. This event led to price hikes, which called for the boycott of British products by Nii Kwabena Bonnie II (also known as Kwamla Theodore Taylor) a radical nationalist traditional ruler.

In the aftermath of independence, in view of the display of stiff opposition to the leadership of President Kwame Nkrumah by the National Liberation Movement (NLM) and other dissident sects of ethnic provenance (e.g., The Action Troopers, Tokyo Joes, Ga Ekomefeemo Kpee), it was apparent that vigilantism had become a symbiotic feature of governance. In pursuing their goals, these groups principally employed dastard means like using guns to unleash fear and terror on their opponents. As a countermeasure to the series of destabilizing events that had characterized governance, the Nkrumah-led government promulgated the Preventive Detention Act of 1958, which empowered the then interior minister of state, (Mr. Krobo Adusei) to arrest and detain persons whose engagements and undertakings were perceived as threats to the state, and as such of dangerous consequence to the state. Going forward, the promulgation of the "Avoidance of Discrimination Act" resulted in the proscription of all political parties in the Gold Coast. Apart from the Convention Peoples Party (CPP) of Kwame Nkrumah, all other political Parties were banned, and further declared illegal.

The ensuing rage and discontentment among the people of Gold Coast informed further vigilante-like machinations against Kwame Nkrumah. Profound among them was the 1963 Kulungugu bomb assassination attempt against Nkrumah. The survival of Nkrumah informed further anti-regime machinations that finally culminated into his oust by Major A.A. Afrifa, E.K. Kotoka and Mr. J.W.K. Harley on 24 February 1966. The post-Nkrumah period ushered in other short-lived regimes including that of President Hilla Limann (24 September 1979–31 December 1981) who was later overthrown by the Jerry John Rawlings' Armed Forces Revolutionary Council (AFRC) in 1979. The Provisional National Defense Council (PNDC) Government incepted thereof by Rawlings was anchored on revolution-based committees and other militia groups (Peoples Defense Committees, Workers Defense Committees), which were essentially intransigent pro-regime vigilante groups (Gyampo 2010).

And quite unfortunately, as opposed to the practice of democracy, Ghana's fourth republic (with 24 registered political parties) has witnessed an onslaught of party vigilante activities. Leading the charge in this regard include the two major political parties: the New Patriotic Party (NPP) and the National Democratic Congress (NDC) (Bob-Milliar 2014; Paalo 2017) who stoke the flames of illegal activities such as ballot box protection and snatching, and other violence such as intimidation, threats, etc.

These groups dispense "essential" services ranging from providing security for party functionaries and events, event organization, protecting ballot boxes at polling stations during elections to engaging in activities targeted at advancing party objectives. Tables 1 and 2 present lists of vigilante groups of the two major political parties (i.e., NPP and NDC) across the regions in Ghana. While the activities of these groups have enabled the consolidation of political power for their respective parties over the years (Gyampo 2010; Asamoah 2019), it is also significant to emphasize not only the substantial threats that their undertakings pose to human rights and the general governance process in Ghana, but also factors that drive this phenomenon.

## Theoretical Underpinnings of Vigilantism and Research Model

Various authorities and scholars (Johnston 1996; Abrahams 2003; Gyampo 2010) have variously conceptualized vigilantism. Regardless of the variants and divergence in concepts, the use of *"vigilantism"* converges around, and summarily reinforces the notion of the unlawful application of force, in contravention with the tenets of Rule

of Law (Nivette 2016) as advanced by A.V. Dicey. Asamoah (2019) defines vigilantism as an illicit law enforcing assembly of a group of citizens in pursuit of a parochial set of group interest. Harnischfeger (2003) also defines it as an enforcement of *"people's justice."* An excavation of literature revealed the unfortunate prevalence of vigilante culture in many societies (Abrahams 2003; Karmen 2012). In the USA, Brazil, and Egypt, for instance, the Ku Klux Klan, Death Squad, and Muslim Brotherhood have, respectively, advanced group interest in their jurisdictions of origin and even beyond.

A concatenation of reasons has been identified to undergird the mushrooming of vigilante groups across the globe. Pratten and Sen (2007) attribute the situation to the laxity of the state, which has created a lacuna that these surreptitious informal groups spring up to fill. Tankebe (2009) reveals the dearth of state incapacity as a potential driver of vigilantism. In respect of the overly partisan nature of Ghana's political landscape, which has created a germane symbiotic relationship between political functionaries and party supporters, Gyampo et al. (2017) observes political clientelism as an efficient propeller of the phenomenon. Nivette (2016) and Phillips (2017) also unearth unfavorable economic conditions as festering grounds for vigilantism. As much as the activities of vigilante groups could have lethal implications, it is apparent that the phenomenon is underpinned by a gamut of precipitating factors ranging from social, economic, and political. This suggests that empirically investigating vigilantism in Ghana must take into cognizance these factors.

Based on the foregoing discussions, and with this broader discourse as a point of departure, our research proposes a model anchored on the Theory of Reasoned Action (TRA) (Ajzen and Fishbein 1980) to investigate how these factors could affect both individual attitude and intention, to either engage in or fall prey to vigilante activities. Given the substantial theoretical and empirical evidence accumulated in its favor, the TRA has actually been employed to investigate behavior on a wide range of fields and subjects. Whereas attitude denotes the effective evaluation toward behavior (e.g., vigilantism), intention signifies the influencers of the behavior performance. The attitude–intention correlation within the TRA suggests that individual's attitude constitutes an evaluation of the inclination to behavior as a derivative of its determinant personal repercussions. Discussed below are the proposed study hypotheses.

## Hypotheses Development

A total of five hypotheses were proposed for our study. All described causal relationship as captured in Fig. 1. At the same time, one hypothesis was related to testing the mediating effect between the four independent variables (i.e., unemployment, distrust, loyalty, and powerlessness) and the dependent variable (i.e., intention to engage in vigilantism).

## Independent Variables

### Unemployment

An increasing body of literature has underscored the potency of limited working opportunities as drivers of instability (Gyampo 2010; Asamoah 2019). Unemployment has also been established as a trigger of tensions that generates riots and spurs more organized political upheaval. By inference, people left with little or no alternative but unemployment are likely to join rebellion sects as a way of gaining sustainable source of livelihood (Asamoah 2019). On this basis, it could be said that one's inclination to vigilantism becomes so high when the potential gains are perceived to be greater. The situation could become more poised in the event of the labor market's inability to absorb available human resources (Asamoah 2019). In view of this situation, in expressing pent up anger and frustration, teaming unemployed populations are likely to engage in incendiary activities. The issue of unemployment is peculiar to both the educated and uneducated. An increase in these populations could spur multipronged upheavals.

Following this, demographic transitions in developing countries and the attendant high unemployment rates is likely to render people more prone and exposed to political instability. Like other developing countries, unemployment in Ghana has concomitantly been increasingly with the population. A World Bank Report (2016) revealed a staggering 48% rate of unemployment among populations within the age category of 14–24. This situation has ensuingly created a germane space for political clientelism whereby individuals (clients) affiliate themselves to politicians (patrons) with the hope of getting employment. And because this has been the case, these clients are bent on engaging in all sorts of activities, even at the risk of their lives to please patrons. Replicating the above discourse within the context of our study, we could sum up that groups that experience unemployment are most likely to engage in vigilantism.

This is likely to happen when people feel marginalized because of lack of job. Unemployment is likely to influence attitude toward vigilantism.

**Political Party *"Footsoldierism"* and *"Vigilantism"*: An Empirical Study, Fig. 1** Conceptual framework

By extension, unemployment is also likely to inform a change in attitude such that people would be likely to regard any short- to long-term engagement in unhealthy activities, such as vigilantism, to be a potential source of life support. In this respect, a positive evaluation of their potential engagement in vigilantism is likely to inform a greater attitude toward vigilantism. In view of the foregoing discourse, our study investigates unemployment as an antecedent of vigilantism in Ghana and proposes the following hypothesis:

***H1:*** Unemployment has a significant positive relationship with attitude toward vigilantism.

## Distrust

Within the context of governance, the theoretical and practical implications of trust are well established. In view of the fact that trust fosters a strong bond between state and government, stability is likely to be the result (Farazmand 2001, 2009). Thus, trust has a tremendous impact on not only the quality of governance, but also, on the healthiness of the relationship between the state structures and citizens, as well their cooperation in driving development. Resultantly, a decline in trust as a social capital has the potency to take a toll on state administration. It is in view of this significance that prior studies have explored and established the pertinence of trust (Farazmand 2004; United Nations 2007).

Whereas high government performance fosters trust in government, poor or low government performance on the other hand is likely to invariably yield distrust. Actually, mistrust could affect citizens' attitude toward vigilantism. This could further impel the individual to engage in activities geared toward advancing political group interest. Going forward, mistrust may also lay a foundation for the individual's rationalization and validation of vigilantism. The cumulative effects of these may influence the individual's attitude toward the phenomenon. The prevalence of distrust could be precipitated by perceptions of administrative and leadership laxity. In a study on election-related violence, Gyampo (2010) and Asamoah (2019) underscore the dwindling trust characterizing the relationship between government, public institutions, and citizens. Among other things, these studies bemoan the frigid relationship, and attribute the anomaly to the politicization of public institutions.

As a consequence, on the heels of the distrust characterizing government and state relations, it has become a political norm that, as a way of expressing anger and equalizing long suffered marginalization, political functionaries have been emboldened to take the law into their own hands to administer group's altruistic justice, by way of unleashing mayhem on opponents. Replicating this discourse within our study context, we seek to investigate distrust as an antecedent to vigilantism in Ghana and propose that:

***H2:*** Distrust has a significant positive relationship with attitude toward vigilantism.

## Loyalty

Proximate theoretical elucidations on support for a political group are partly steeped in choice, and the individual's support for values, which in turn induces loyalty. On these fronts, it is comprehensible that one's attachment or sense of belonging to a group could implicitly influence either a positive or a negative behavior. By inference, membership of a political party covertly or overtly, may correspondingly provoke individual behavior targeted at advancing the interest of a political party. Literature on political behavior advances potential factors that may excite an inextricable relationship between party structures on one breadth, and individual supporters on the other. Given that party structures are essentially a representation of an amalgam of social, religious, and cultural values, principles, tenets, etc., it may be convenient to conclude that individuals support for a party are largely influenced by these factors.

For this reason, whenever individual's regard these structures as fit, appropriate and strong enough to advance their held beliefs and vision, they are likely to remain loyal (Gyampo et al. 2017). Loyalty informs the degree of individual connection and affinity to a structure (i.e., political party). In this regard loyal party supporters are likely to not only remain tied, but also inherently feel a sense of obligation to exert efforts, and expend resources toward the realization of party goals. It is on this score that our study argues for

the instrumentality of loyalty as a motivator for vigilantism. On this basis, our study argues that, individuals' sense of attachment is likely to impose a sense of obligation that may further influence their evaluation to prioritize vigilantism as something of utmost relevance, as far as the defending party interests is concerned. In view of the foregoing discourse, we propose the following:

***H3:*** Loyalty has a significant positive relationship with attitude toward vigilante acts.

### Powerlessness

By nature, shape, and form, political vigilantism, otherwise referred to as footsoldierism has inherent invoking factors cardinally triggered by ideations and considerations of marginalization within the broader context of a social structure (Smith 2004). In view of this, local communities or political party members who commonly share political identity, interest, and other threat perceptions, mobilize to assert their might and act potentially more powerful against state structures in pursuit of a parochial agenda that could forcibly either situate a nation in a conflagration, or push it onto the brink of collapse. By looking forward to maximize power through violent means, vigilantes often take advantage of their newfound capacity and compensate themselves for the setbacks suffered.

In view of the recent efflorescence of vigilantism in Ghana, part of the social discourse-based efforts to diagnose the situation, and identify possible propelling factors, has not only elicited, but duly brought to the fore a flurry issue principally hinged on "feelings of hurt and pains" (Asamoah 2019). In essence, the argument of activists has underscored an ill perception regarding incumbent governments attempt to use state authorities like state security, and other Ministries, Departments, and Agencies (MDA's) to weaken political parties have an edge over them to score political points, and ultimately win future elections. More so, in the views of the supposedly sidelined groups contending with the ill treatment meted out to them by government through state institutions, they begin not only to question the contour of the state, but also attempt to delineate where the overwhelming powers of a legitimately composed state structure begins and end – in so far as promoting equal access and ensuring their equitable distribution to all class and groups of people is concerned (Gyampo et al. 2017).

After a careful interrogation, Gyampo (2013) attributes the situation to the polarizing "winner takes all" kind of politics that has pushed members of the non-ruling class to the periphery of governance, for which reason they are denied access and legitimate stake in state resources. It is in view of this that such groups consider government to act on behalf or at the behest of the ruling class (in Marxist interpretation) that these groups feel disempowered. To this end, people tend to be unsure of who stands for what, and who stands to represent the interest of spineless groups. With this at the forefront of the consideration, groups and individuals get whipped up into action to advance their peculiar courses. Therefore, it is concluded that whenever a group of people (i.e., political party loyalist) experience or perceive subjugation and tend to feel powerless, they are more likely to devise and deploy suitable mechanisms to empower themselves in a way that fits the mold of their expectation. Based on the foregoing discussion, our study outlines the following hypothesis:

***H4:*** Perceived powerlessness has a significant positive relationship with attitude toward vigilante acts.

## Theory of Reasoned Action (TRA) Variables

### *Attitude* (Mediator Variable) – *Intention* (Dependent Variable)

The Theory of Reasoned Action (TRA), an emanation from Ajzen and Fishbein (1980) has been established in research as an efficacious model capable of predicting behavioral intentions. The theory fosters an understanding of human behaviors, and the proximate intentions underlying them. The theory, considered as an appropriate model for studying behavior intentions anchors individual action (engendered by both internal and external factors) on behavioral intention.

From a careful interrogation and excavation of literature on global *"vigilantism"* and "*footsoldierism,"* factors bordering on unemployment, distrust, loyalty, and powerlessness were employed as representative of internal and external variables providing or perhaps capable of providing impetus to ideations of *"vigilantism"* and "*footsoldierism."* Complementarily, these factors are integrated into TRA variables (i.e., attitude and intention) for the study. Relative to TRA, Attitude is a representation of one's affective evaluation toward a task (Ajzen and Fishbein 1980).

Attitude as a streamliner of behavior intention determines the response disposition of the individual to a task. This could be either positive or negative. In relation to the subject matter under study, attitude toward vigilantism refers to the degree of individual's disposition or otherwise to vigilantism which is proposed to be determined by the additive contributory effects of unemployment, distrust, loyalty, and powerlessness. Intention on the other hand refers to factors that influence a desired behavior (e.g., involvement in vigilante behavior). It also captures the inclination of an individual to commit a behavior. Summarily, the performance of behavior is finally predicated on intention (Ajzen 1991). Within the context of our study, behavioral intention as the final predictor of behavior (Armitage and Conner 2001) is suggested to be determined by the additive and incremental contribution of all the independent variables and the mediator. The attitude–intention relationship within TRA posits individual's attitude as an evaluative predisposition to behavior as a function of its determinant personal consequences (Ajzen 1991).

In relations our study, we propose that, whereas a negative evaluation of vigilantism is likely to dissuade the individual, a positive evaluation (based on realizing perceived individual and group objectives) is likely to persuade the individual to engage in vigilantism. As such, our study argues that the complementarity of attitude as a mediator would help explain the intention of the individual to engage in vigilantism, or otherwise. From the foregoing, we propose that the following:

***H5:*** Attitude has a significant mediating effect on the relationship between attitude toward vigilantism, and intention to engage in vigilantism.

## Data and Research Method

### Sample and Data Collection

The study used a questionnaire to elicit data to test the proposed study hypotheses. Study participants who had attained the minimum age of 18 and beyond were targeted. The age limit was set with recourse to the voting age in Ghana (Ghana Republic 1992). Before the commencement of survey, pilot studies were conducted to validate, as well as adjust and refine the wording of the questionnaire. To obtain a representative sample, we sampled respondents from across Ghana. These areas were essentially distinct in demography (i.e., size, living conditions, sociopolitical behavior, etc.). To encourage response, gifts such as keyholders and USB flash drives were offered as incentives. The study drew data from 1 January to 30 March 2020. The research developed an English questionnaire containing 18 questions disseminated over chosen constructs. Study constructs were adapted from prior studies who had established their reliability and validity. In total, 450 questionnaires were distributed. Upon review and discarding of incomplete questionnaires, 366 useable questionnaires remained, representing an 87% response rate. Given that data was drawn from different areas, chi square and T-test were conducted to test variations between samples (Armstrong and Overton 1977). The results revealed no significant differences. The sociodemographic composition of the study sample is presented in Table 3.

### Measures

Variables for the study were composed of four (4) latent variables, one (1) mediator and one (1) dependent variable. Items were adapted from prior studies and later refined to fit the current study context. All study items were measured on a 5-point Likert scale ranging from strongly

**Political Party *"Footsoldierism"* and *"Vigilantism"*: An Empirical Study, Table 3** Descriptive Information of the Sample ($n = 366$)

| Characteristics | Frequency ($n$) | Percentage (%) |
|---|---|---|
| ***Gender*** | | |
| Male | 321 | 87 |
| Female | 45 | 13 |
| ***Age*** | | |
| 18–25 | 97 | 27 |
| 26–35 | 109 | 30 |
| 36–45 | 115 | 31 |
| 45+ | 45 | 12 |
| ***Education*** | | |
| Others | 85 | 23 |
| Primary | 99 | 28 |
| Secondary | 82 | 22 |

| Greater Accra | 45 | 13 |
| Ashanti | 35 | 10 |
| Central | 33 | 9 |
| Western | 38 | 10 |
| Eastern | 32 | 8 |
| Upper West | 32 | 8 |
| Upper East | 33 | 9 |
| Northern | 48 | 13 |
| Volta | 35 | 10 |
| Brong-Ahafo Region | 35 | 10 |

disagree (1) to strongly agree (5). The measurement items for *"unemployment"* were adapted from (Kanwal et al. 2019). Moreover, items for *"distrust"* were adapted from Mishra and Bekuretsion (2020). Items for *"loyalty"* were also adapted from Anderson and Srinivasan (2003). Furthermore, items for *"powerlessness"* were adapted from (Jones 2019). Also, items for *"attitude"* and *"Intention"* were adapted from Han et al. (2010).

A brief overview of the study was provided to respondents at the beginning of the questionnaire to enhance their understanding. In addition to the fact that respondents were notified of their liberty to drop out at any stage of the data collection, they were equally assured of their anonymity, and further informed that elicited data was going to be used purely for academic purposes. In view of this, respondents were not asked to provide their names and other contact details.

## Data Analysis and Results

In view of the theoretical framework and the proposed hypothesis, the Structural Equation Modeling (SEM) technique, along with Analysis of Moments of Structures (AMOS) version 24 was employed to establish the model and data analysis. The ultimate reason underpinning the utilization of SEM is anchored on: (a) examining series of dependent variables at the same time, especially in a situation where there exist direct and indirect effects among constructs (Hair et al. 2010); (b) Analyzing interrelationships between latent and observed variables; (c) modeling errors within observed variables and providing exact measurements; and (d) measuring latent variables using multiple indicators and testing hypotheses at construct, rather than item level (Hoyle 2011). In analyzing data, a three-step approach was employed. Measurement model was confirmed

to establish the validity and reliability of constructs at the first step. The structural model was evaluated in the second step employing hypothesis testing. Mediation analysis was conducted to test the mediating effects of attitude on the relationship unemployment, distrust, loyalty, and powerlessness all on one side, and intention on the other.

## Model Analysis

Exploratory Factor Analysis (EFA) was conducted with Statistical Package for Social Scientist (SPSS) to evaluate factor loadings, reliability, convergent, and discriminant validity of the proposed model. Results of factor loadings (Table 4) for study items ranged from 0.667 to 0.810, which is reconcilable with the recommended benchmark of 0.70. Test of reliability revealed Cronbach alpha values (Table 5) to be greater than 0.7 signifying a suitable reliability of scale (Fornell and Larcker 1981). Average variance extracted (AVE) values and composite reliability measures were used to imply convergent validity. The scores of composite reliabilities were greater than 0.7, signifying the sufficiency and representativeness of items of proposed constructs (Hair et al. 1998). AVE values greater than 0.5 signifies a good convergent validity (Fornell and Larcker 1981). Discriminant validity was assessed using both cross-loadings (Table 4) and correlations among constructs. The cross-loadings among constructs are smaller compared to their corresponding factor loadings, and the square root value of AVE for each construct is shown to be greater than correlations among constructs (Table 6). This is a clear indication that items measuring constructs are distinct from others. This signifies the validity and reliability of the measurement model.

## Measurement and Structural Model Evaluation

Analysis of Moments of Structures (AMOS) version 24 was used to assess the goodness-of-fit of the structural and measurement model, and also to test the significance of their respective hypothesis paths. Indices examined to test the overall fitness included Normed Fit Index (NFI), Comparative Fit Index (CFI), Incremental Fit Index (IFI), Root Mean Square of Error of Approximation (RMSEA), and Normed Fit Index (NFI). These indices constitute the benchmarks for signifying

the diverse categories of model fit measures as presented in Table 7. From Table 7, there is sufficient evidence that all measurements have good fit consistent with Wu (2010). Altogether, the study model finds good fitness in view of the recommendations of (Elkaseh et al. 2016). Hence, the measurement and structural models are acceptable.

## Hypothesis Testing Effects

Next, the study tested the proposed hypothesis of the model. Figure 2 captures the path analysis of the structural model. The output of analysis indicates that unemployment (β = 0.281***, t = 6.206, $p$ <0.001), distrust (β = 0.157, t = 5.387, $p$ <0.001), and loyalty (β = 0.090**, t = 2.589, $p$ <0.01) were all revealed to have a significant positive relationship with attitude. These findings were in support of H1, H2 and H3.

Furthermore, our results revealed that, powerlessness had a significant positive relationship with attitude toward vigilantism (β = 0.142***, t = 4.074, $p$ <0.001). Finally, intention was also revealed to have a significant relationship

with intention to engage in vigilantism (β = 0.531***, t = 7.210, $p$ <0.001). These findings were in support of H4 and H5. Summarily, the results of hypothesis testing revealed the support of all proposed study hypotheses (Table 8).

## Test of Mediation Effect Analysis

As part of the data analysis for this research, we conducted the mediating effect analysis to find out how attitude mediates between the independent variables (IVs) and the dependent variable (DV), thus intention to engage in vigilantism. Test of

mediating effects adopted the criteria proposed by Zhao et al. (2010) and Preacher and Hayes (2004).

As captured in Table 9, test of mediating effects revealed that attitude mediated the relationship between unemployment and intention to engage in vigilantism. Furthermore, our results revealed attitude to mediate the relationship between distrust and intention to engage in vigilantism.

Similarly, attitude was confirmed to mediate the relationship between loyalty and intention. Finally, attitude was confirmed to mediate the relationship between powerlessness and intention. Summarily, our test of mediating effect analysis revealed attitude to mediate the relationship between the four independent variables (IVs) and the dependent variable (DV). This outcome is in support of our proposed study hypothesis 5.

## Discussion, Conclusion, and Recommendations

The principal objective of the present study was to explore the antecedents of vigilantism in Ghana. Through an excavation of prior literature on the subject matter under investigation, our study proposed a theoretical model to empirically investigate the phenomenon. By so doing, our study departs from prior qualitative studies (Gyampo et al. 2017; Asamoah 2019; Bjarnesen 2020) and situates our study within the theoretical context of behavior to undertake a quantitative empirical study, which aims to foster and deepen an understanding of vigilantism in Ghana. By so doing, our study essentially contributes to literature by establishing the nomological relationships between social, political, and economic factors underlying behavior disposition and inclination, relative to vigilantism.

In recent times, more particularly in the fourth republic dispensation, vigilantism has taken a deep-seated position within Ghana's political space. And gradually, as an antithesis to the principle of Rule of Law, the growing apparition appears to be gaining a foothold in the democratic sphere of Ghana. A careful observation of the unfolding events of vigilantism reveals it as not only multifaceted in form, shape, and size, and but also varying in tactics to include the resort to physical attack and other forms of violence. Resorting to vigilantism has essentially been the conduit for individuals and group of individuals to advance their varying peculiar interests. The study presents enthralling findings, which underscore the fact that, as much as vigilantism does not occur in a vacuum, it is spurred by a confluence of factors converging around unemployment, distrust, loyalty, and powerlessness.

Specifically, data analysis results of our study revealed unemployment to have a significant positive relationship with attitude toward vigilantism. This result, which recorded the highest beta value at a significance level of ($\beta = 0.281$, $t = 6.206$ $p = 0.001$), is in support of our proposed hypotheses 1. This result could be interpreted in the light of the generally declining global employment avenues, and more particularly in Ghana. Actually, the existence of limited, or a dearth of working opportunities, an obvious sign of state relapse, has the propensity to render people vulnerable to all sorts of opportunities perceived to offer a sustainable source of livelihood – either in the medium, short, or long term. In the face of these

situations, the individual's attitude, which is a summary of the evaluation of the worthiness of a behavior, is likely to be positively enhanced. In much the same way, the propensity (as captured in attitude) to fall for vigilante recruitment bait, or offers, becomes much greater. Studies pinpoint to unemployment as an efficient enhancer, and an effective enabler of different forms of violence including vigilantism.

The unappealing situation regarding employment avenues has the tendency to move a teaming group of unemployed populations to form dissident groups, and act with impunity by unleashing terror on their targets. This explains the reason why Ghana's Fourth Republic has perennially, altogether persistently witnessed unemployed youth protest. In staging these acts, protesters have made it a preoccupation to sack public office holders and locking their offices with the hope of being offered such opportunities (Graphic Online 2016; Citifmonline 2017). Currently in Ghana, though the government's response to the unemployment situation has resulted in the creation of avenues such as The National Youth Employment Programme (NYEP), Nation Builders Corps (NABCO), etc., generally speaking, unemployment has been on the rise for the past 5 years (Asamoah 2019).

This situation exposes a grave deficit in the state's capacity to act as an unfailing shock absorber, by creating sustainable revenue-earning avenues for citizens. It is in this regard that citizens repose trust in political functionaries and other "god fathers" as providers of employment. Until the unemployment situation is resolved, tackling vigilantism head-on is likely to be a façade. Part of the resolve to remedy the malaise situation requires the creation of a germane socio-economic space for particularly small and medium enterprises. The results of our study echo the concerns earlier projected by (Nivette 2016).

Furthermore, our study findings revealed a significant positive relationship between distrust and attitude toward vigilantism ($\beta = 0.157^{***}$, $t = 5.387$, $p = 0.001$). This result, corroborating our proposed hypothesis 2 recorded the third highest beta value. This could be interpreted to imply that the dearth of trust in government, and as such, public institutions, can create a germane space for vigilantism to thrive. In Ghana, the chief executive head of state, who also happens to be the leader of his or her political party, makes major political appointments to state Ministries, Departments and Agencies (MDAs). This practice has fueled an impression to the effect that government as the entity is responsible for being in charge and has the prerogative or greater influence in making appointments.

By extension, this notion has further fueled the notion among opposition party member that the absolute control, and the somewhat monopoly wielded by incumbent governments, could be abused to the advantage of the latter's whims and caprices. Because this has been the case, opposition parties consider themselves as been denied a fair share of the "national cake," including, but not exclusive, to state security. To this end, members of the opposition parties perceive state institutions as not only an extension, but also accessories and appendages of incumbent governments, for which reason they cannot risk trusting. These perceptions have the tendency to unwaveringly fuel the inception of informal and unlawful entities like vigilante groups. An open and shut case of mistrust between government and opposition political party was witnessed during a by-election boycotted by the opposition NDC, on grounds of alleged state security maltreatment of its members.

In this case, the alleged use of the state security against the opposition party was argued to be possible because the constitution of the Republic of Ghana, under Article 202 (1) statutorily empowers the president to appoint the head of the police service, (thus the Inspector General of Police-IGP), in concert with the Police Council (Ghana Republic 1992). The overwhelming appointing powers conferred on the president are further captured under Article 195 (1) Ghana's constitution where it is explicitly stated that;

> Subject to the provisions of this Constitution, the power to appoint persons to hold or to act in an office in the public services shall vest in the President, acting in accordance with the advice of the governing council of the service concerned given in consultation with the Public Services Commission.

In view of these powers, the involvement of political figures in making appointments to key public offices and other state parastatals has the tendency to create mistrust, and at the same time inform a decline of public confidence in public institutions. In this regard, Karmen (2012) and Silke (2001) contend that public perception of state institution's complicity in inefficiency and laxity at reneging on statutory obligations could pose dire ramifications. In this respect, it could be posited that the inability, or perhaps failure, of government as a state administrative machinery, to depoliticize and decouple state institutions from purely partisan activities, explains part of the issue of mistrust and state relapse prior raised by Gyampo et al. (2017).

Moreover, the results of our study revealed loyalty to have a positive significant relationship with attitude toward vigilantism ($\beta = 0.090^{**}$, $t = 2.589$, $t = 0.01$). This result, which is in conformity with our study hypotheses 3, was the least predictor of attitude toward vigilantism. An interpretation this finding could be better appreciated when situated within the patron–client praxis, which appears to be the most predominant political culture characterizing relations within Ghana's political sphere. Clientelism as a tradeoff between a politician (patron) and a follower (client) is not only founded on support, but also characterized by expectations of mutual benefits. In view of the perceived bonds that clients seek to establish with patrons in anticipation of mutual reciprocal benefits (cash, kind etc.), the former is inclined to sheepishly commit themselves to advancing the interests (Brinkerhoff and Goldsmith 2004; Robinson and Verdier 2013; Kusche 2014), ideologies, and stance of the latter. In patron–client relationship, the former foregoes national interests and supports the latter based on their loyalty. For this reason, in regions of social, political, and economic imbalances, people outside the sphere of the ruling class are most likely not to be rewarded.

As a result, the spineless members of the society are forcibly enticed into loyalty networks as a conduit to guarantee them favors such as employment, award of contracts, etc. (Robinson and Verdier 2013). Correspondingly, clients hope that their loyalty would offer them a stake and secure them a stake and a deep bite of the political largesse anytime their patrons access power. This mix of expectations do influence individual's attitude toward vigilantism in the sense that in so far as clients foresee inherent benefits, they are more likely to positively evaluate vigilantism as worthwhile, and as such a results-oriented venture. Following from the above, it is instructive to underscore that vigilantism arises an as an initiative induced by loyalty to patrons and political ideologies.

As per the data analysis results of our study, powerlessness was revealed to also have a significant positive relationship with intention to engage in vigilantism ($\beta = 0.142$, $t = 4.074$, $t = 0.001$). This was the construct with the second highest beta value. Anatomization of this finding, which corroborates our proposed study hypotheses 4, implies that individuals with a sense of insecurity are likely to be compelled to devise mechanisms targeted at advancing their personal security and that of their political party. For this reason, individuals are likely to engage in vigilante activities. Scholars contend that, individuals' disposition to violence and crime is impelled by concomitant feelings and ideations of insecurity (Appiahene-Gyamfi 2002), which have the tendency to expose the vulnerabilities and frailties of a country's attempt at democratic experimentation. The prevalence of insecurity injects fear, disillusionment, and disconcertedness in citizens. This situation is likely to spur vigilantism, which may further jeopardize the tranquil political atmosphere required for the flourishing of democracy.

Finally, our study confirms the significant positive relationship between attitude toward vigilantism and intention to engage in vigilantism ($\beta = 0.531^{***}$, $t = 7.210$, $t = 0.001$). This is in corroboration of our proposed study hypothesis 5. This suggests that, attitude toward vigilantism (determined by the additive and incremental contribution of the exogenous variables) is a reliable and an efficient conduit for predicting behavior intention. Within our study precincts, this finding suggests that, when individual party supporters perceive of vigilantism as positive, and as such

necessary for advancing individual and group parochial interest, there is the likelihood of exerting a positive predisposition toward the formation of an intention to engage in acts of vigilantism. Overall, our study concludes that political vigilantism as a bourgeoning political culture thrives at the intersection of social, economic, and political factors. The collectivity of these factors has the potency to impair development in all its multifaceted dimensions. People engage in vigilante activities to advance narrow interests. In this respect, Ghana's advancement toward democracy may be withheld if proactive measures are not instituted to fight the phenomenon. On the basis of our study findings, we recommend the following:

Firstly, state and non-state development actors should endeavor to vigorously pursue equity and inclusiveness within the broader Ghanaian society. Key among other things, in pursuit of equity, employment avenues should be created to absorb the teeming population of the unemployed in Ghana. Also, personnel recruitment into public sector institutions should be based on merit, and be made as transparent as possible for all people to be accorded equal chance of selection without favor or discrimination. Essentially, ensuring these would reduce discontent dissatisfaction, and poverty, which are established as key drivers of vigilantism. Moving forward, government initiatives must take into cognizance the provision of financial support, or other forms of incentives stimulus packages for small and medium enterprises and/or investors.

Secondly, appointees and occupants of public office positions must also endeavor, or be entreated to serve in the national interest, regardless of the appointing authority, or government in power. The demonstration of a sense of professionalism, neutrality, and anonymity in the exercise of statutory obligations could go further to inject public confidence in state and/or public institutions, as well as its occupants. Also, incumbent governments should desist from meddling in the affairs of public institutions. While allowing the free operations of these institutions, they should also offer other parties unimpeded access to essential service providing institutions like the state security, etc.

Thirdly, through constitutional means, the inundating executive powers conferred on the president to make extensive appointments should be limited. Such arrangements must consider ceding such powers to apolitical bodies like the public service commission. In regard to appointments in the Police Service and the Judiciary, we recommend the Police Council and the Judicial Council to be empowered to make appointments devoid of the involvement of political functionaries.

Moreover, state security agencies, in concert with civil society organizations, must sensitize the public on vigilantism. Bodies like the Political Parties, Judicial Service, National Centre for Civic Education (NCCE), Centre for Democratic Development (CDD), Institute for Democratic Governance (IDEG), Ghana Police Service (GPS), and others must persistently engage Ghanaians on the lethal effects of vigilantism, and the need to disengage from such acts. And finally, state security apparatus must be adequately equipped, and further be allowed to operate autonomously without fear or favor, discrimination or any form of interferences from any quarter. The judiciary and the security services must be allowed to be independent relative to appointments, promotions, demotions, determination of working conditions, and other emoluments and benefits.

## Implications and Limitations of the Study

The results of this empirical study provide sufficient insights for policy makers on the drivers of vigilantism. State security entities can also tap into the study findings to find ways of tackling the canker head-on and step underfoot, its deleterious ramifications. Government, nongovernment, and other civil society organizations in and outside Ghana can also rely on our study and integrate the findings and recommendations into strategies targeted at countervailing vigilantism. Finally, this study has certain limitations, which needs to be further delineated to guide future research. First, this study is quantitative. The data for the study were elicited through questionnaire survey. Future research could employ qualitative or mixed study

approach to gather extensive data, and further broaden perspectives on vigilante discourse. Given that the study was conducted in Ghana, we strongly recommend future studies to conduct other country-specific study or possibly engage a cross-national population to help test the robustness of the proposed study model.

# Political Sociology in Latin America

Simón Escoffier
Instituto Chileno de Estudios Municipales, Universidad Autónoma de Chile, Santiago, Chile

## Synonyms

Citizenship; Clientelism; Elites; Latin America; Social movements

## Definition

Political sociology is far from enjoying a fixed, univocal definition. Not only are political sociologists using the most varied approaches in their analyses, but also they often outline the field with very diffuse boundaries. In broad terms, however, political sociology should be understood as "the social bases of politics." In other words, political sociology avoids conceiving the pacts, tensions, and negotiations between political agents in a vacuum. Instead it sees those

agents as closely interconnected with social institutions (i.e., education, family, religion, and others) (Orum 1978). Social movements, democracy, elite circulation, and clientelism have been fields of study traditionally addressed by political sociologists.

Additionally, current political sociology should be conceived as a tension between two broad approaches. Firstly, a traditional approach sees politics from a more positivistic, analytical, and explanatory perspective. It has focused on the social and political role of the state and has prioritized the framework of the nation-state. This mainstream view conceives politics as a system of struggles seeking to influence power distributions within the state or between states (Evans et al. 1999; Weber 1946). This perspective interacts more naturally with political scientists and economists.

Secondly, in the past couple of decades, a new approach has complemented sociological studies with a cultural perspective to political phenomena. It highlighted the current erosion of traditional institutions as well as people's diminished sense of community This view changed its focus on the nation-state to studying people's novel constructions of community and identity. Consequently, this approach studies the processes of politicization by which collectives build alternative forms of power and incorporation (Nash 2010; Taylor 2010).

## Introduction

This chapter provides an overview of how political sociologists have explained Latin American societies. The chapter looks at how social factors influence political developments in the region through three traditional fields within political sociology: elite circulation, political clientelism, and social movements. In each one of these fields, the chapter begins by addressing how traditional political sociologists have understood the region. Then, it explains how new perspectives of political sociology have addressed each of those fields of study. This general analysis on the political sociology of Latin America unveils the dynamics by which inequality and exclusion undermine democracy.

The processes by which elites circulate in their access to the state in Latin America have been generally determined by the entrenched social structure that dominated almost three centuries of colonial rule. Based on the oligarchic concentration of power, this structure was only partially challenged by the populist governments that emerged after the 1930s and by democratic transitions in the 1980s and 1990s. More recent, cultural approaches have highlighted the influence of external institutions – especially the Catholic Church – in explaining Latin American symbolic systems of elite reproduction.

Weak institutions and highly unequal societies have made Latin America a fertile soil for political clientelism. Latin American clientelism often involves highly authoritative, violent, and controlling interactions between local leaders and citizens. More cultural perspectives provide evidence of the empowering potential of clientelism.

In a context of readjustment policies that have pushed governments to scrap social rights and sustain inequality over time, Latin American social movements have reacted with diverse, innovative strategies. In most cases, these strategies have involved coconstructing collective action with other, institutional efforts. Political sociologists have, for example, shown how contentious mobilization can in some cases combine with clientelism to reach more effective results. Alternative approaches to Latin American social movements underline their potential to construct novel political identities and build broader political communities at the urban or the global levels.

## Political Sociology in Latin America

The social structure that emerged in the seventeenth and eighteenth centuries as a result of colonial rule has defined norms of exclusion across Latin America (Jara and Magana 1982). Based on ideals of race, ethnicity, and class, Latin American states have systematically disregarded the rights of indigenous population, afro-descendant groups, and the urban and rural poor.

Latin America is currently the most unequal region worldwide and the poverty rate in many of its countries is over 20% (The World Bank 2016). Simultaneously, since the late 1960s, Latin American nations have developed economies based on foreign debt. Under the pressure of the IMF and the World Bank, the region has increasingly lost economic autonomy. Latin American countries have increasingly opened their economies through free-trade agreements and have abandoning policies that substituted imports with local industrial production. Foreign states and international agencies have pushed Latin American nations to privatize companies and implement structural adjustments that include budget cuts to crucial public services – i.e., education, health, housing, employment, transportation, and others. In several Latin American nations, the vulnerability that large sections of the population experience, in contexts of weak institutions, has resulted in corruption, criminality, and violence (Almeida and Cordero 2015).

While critics will correctly argue that many civil society initiatives, social policies, and redistributive programs have advanced the incorporation of the underprivileged in Latin America, a general overview from the standpoint of political sociology underscores the regional imbalances of power. The following sections focus on three traditionally substantive areas of study: elite circulation, political clientelism, and social movements.

## Elite Circulation

Political elites can be defined as "persons who are able, by virtue of their strategic positions in powerful organizations, to affect national political outcomes regularly and substantially" (Burton et al. 1992, p. 8). Traditional analyses on elites in Latin America can be traced to the early nineteenth century. The processes of independence in that period gave local elites the opportunity to struggle for their access to the state in each new nation.

Latin American emancipatory processes restructured the local arrangements of colonial power. Enjoying the highest power in the colonies, the Spanish-born were always in conflict with the local Creoles. The Napoleonic invasion of the Iberian Peninsula in 1808 questioned the authority of the Spanish crown and gave Creoles the opportunity of seeking new social positions. Unlike European emancipatory movements that enjoyed strong popular engagement, Latin American independency processes resulted from these rearrangements within local elites. The independence gave rise to a set of autonomous warlords that filled the power void resulting from the decline of imperial elites by controlling territories through force. This period after the independence has been known as the "era of caudillos" (local, personalist leaders exercising military and political power) (Chevalier 1999).

Where elites were more fragmented, such as Argentina and Mexico, caudillos became more prevalent. The lack of elite integration resulted in loss of land for these nations. By the end of the nineteenth century, however, the whole region had built and oligarchic regime based on commodity exports and international lending. Mainly based on rural land exploitation, oligarchic elites reached sustainable levels of horizontal integration, which allowed them to access, shape, and expand the state without substantial efforts to reach the masses. Soon, social, political, and economic changes eroded the oligarchic regime (Rovira Kaltwasser 2009).

Seeking protection from regional and global enemies, Latin American countries – such as Argentina, Brazil, and Mexico – modernized their military. Modern weaponry was imported and new official academies professionalized the military personnel. A novel military elite rose to challenge entrenched oligarchic privileges. Additionally, the export-based liberal economy that enriched the oligarchy built differentiation and facilitated the movement of people. At the beginning of the twentieth century, Latin America experienced a strong wave of immigration from abroad combined with increasing rural-urban migration. Urban actors became more important and threatened the power of the rural oligarchic elite. This resulted in a cleavage between the oligarchic elite and the new emerging counter-elite.

After the Great Depression (1930s), the new elite increased its power and sought to put the state in the center of national development. Different military interventions, elite coalitions, and

populist governments characterized the following decades. Argentina's elite fragmentation and regular military interventions, for example, resulted in a precarious political system that could not deal with the gradual incorporation of the lower classes. This set the conditions for the election of Perón's populist government in 1946, whose friend-and-foe dynamics made it impossible to expand party representation and to avoid elite–counter-elite conflicts. Chile and Brazil had a more gradual erosion of elite hegemony. Conversely, two civil conflicts – the Mexican Revolution (1910–1920) and the Cristero War (1926–1929) – settled the Mexican elites. Taking power in 1929, the Institutional Revolutionary Party (PRI) embodied a cohesive, hegemonic elite that exercised effective civil control over the military (Rovira Kaltwasser 2009). These different developments led to also different results. In countries of the Southern cone, partial or failed elite settlements led to coups and recent dictatorships – e.g., in Argentina (1976–1983), Chile (1973–1990), Uruguay (1973–1985), Paraguay (1964–1989), and Brazil (1964–1985). These countries built what became known as bureaucratic-authoritarian regimes. Military dictatorships persecuted, imprisoned, tortured, killed, and exiled thousands of political opponents. Instead, governed by the PRI through 1989, Mexico became a semiauthoritarian regime. Its political system dealt efficiently with conflicting political minorities and secured the reproduction of the ruling elites (Garrido 2005; O'Donnell and Schmitter 1986).

In countries suffering dictatorships, the heads of the ruling military conducted negotiations with the leaders from the major opposing political forces in order to carry out democratic transitions (Przeworski 1986). To a certain extent, these transitions enjoyed stability because elites implemented amnesty laws to perpetrators of human rights abuses and provided a relative political autonomy to the military. The democratic regimes that emerged in the 1980s and 1990s combined that special treatment to the military with a stable cooperation between groups in their national economic and intellectual elites. While countries such as Brazil, Uruguay, Chile, and Argentina have advanced in their processes of transitional justice – by partially delivering reparation to victims and holding some perpetrators to account – they still have substantial progress to make in restoring the dignity of victims of human rights abuses (Olsen et al. 2010).

The neoliberal policies prescribed by the IMF and the World Bank that most Latin American countries implemented in the 1980s and 1990s stabilized growth for most countries. However, they also built simpler, extractive economies. Simultaneously, middle classes across the region strengthened by growing in number and by increasing their levels of consumption. Lower and working classes built new movements that opposed inequality and political exclusion (Almeida and Cordero 2015). As a result, new counter-elites defending redistributive policies and social rights saw their projects democratically validated in the 2000s. Lula Da Silva's and Rafael Correa's presidential victories – in Brazil (2003) and Ecuador (2006), respectively – are prime examples of how rearrangements in the distributions of power allowed new elites reaching the government through agendas that combined populist, state-centered policies with a neoliberal, export-oriented extractive economy. The entrenched stability of horizontal integration among posttransitional elite sections progressively disappointed the middle and lower classes in Chile. Consequently, since the early 2000s, the Chilean political elite has progressively lost credibility. In regional comparative terms, Chile shows particularly high levels of popular disengagement from institutional politics (Joignant et al. 2017).

Besides focusing on how Latin American political elites seek to reach the state, political sociologists have also paid attention to their cultural practices of incorporation. These analyses have gone beyond the nation state to highlight the symbolic forces that culturally shape groups in positions of power. These studies have argued that Latin American elites are highly influenced by external institutions – i.e., the Catholic Church as well as European and North American ideas. These institutions define the set of symbolic rules by which influential and powerful groups within

the elite exercise incorporation and exclusion. The Opus Dei and the Legionaries of Christ, for example, have become highly influential on how elites counter pluralism and reproduce in Latin American societies (Thumala Olave 2010).

Trained in prestigious schools of business and economics in the United States – especially at Chicago University – the group of Latin American economists known as the "Chicago Boys" are another example of how elite culture has been externally shaped. Strongly adhering to Friedman's and Harberger's liberal, market-oriented economic policy model, the Chicago Boys returned to their countries of origin – Mexico, Chile, Argentina, Uruguay, Perú, Colombia, Costa Rica, and others – after completing their graduate studies in the United States to take high positions in the government and relevant companies. They not only influenced the policies implemented in their countries – especially in Chile – but they also shaped the economics departments in the most prestigious universities in the region. By effectively transmitting their highly liberal economic models to local Latin American elites, the Chicago Boys contributed to culturally smoothing the way to the set of neoliberal reforms implemented in the region between the 1970s and 1990s (Biglaiser 2002).

## Clientelism

Clientelism is defined as "the distribution of resources (or promise of) by political office holders or political candidates in exchange for political support, primarily – although not exclusively – in the form of vote" (Gay 1990, p. 648). Students of clientelism call "patrons" those actors that withhold and manage power and resources (i.e., a political representative). "Clients" are those potential voters that benefit from the patron's discretional distribution of resources. "Brokers" are often figures within a specific community that act as connecting actors between patron and clients.

Latin America is often seen as one of the most prolific grounds for the development of clientelism worldwide. Focused on whether vulnerable citizens in a specific nation are able to influence state decisions, social and political analyses have regularly deemed clientelism as an impediment to full democracy. Analysts suggest that in impoverished areas patrons exercise power over clients curtailing their ability to freely choose their representatives. Additionally, by discretionally targeting benefit delivery to supportive groups, clientelism leaves many people in need with no access to resources.

The roots of clientelism in the region can be traced to 1912, when Argentina declared universal suffrage for men. Most other countries also did so in the mid-nineteenth century. Since then, political elites have strategically boosted electoral turnout. Newly created nations struggled to build centralized, powerful, and stable states in which systems of incorporation of the masses were not defined. Initially, leaders used the networks that they had created in their institutional positions as clients – within the military, the police, or even local government staff. Initially, clientelism worked mainly as the exchange of jobs for political loyalty. This was especially prevalent among municipality employees. But also land and company owners aligned their workers to support particular candidates. In the nineteenth century, voting polls were usually associated with violence. States had not yet implemented secret ballot and patrons brought their clients to control churches and other voting buildings. Often, voting resulted in confrontations between rival groups. In consequence, a very partial fraction of the population voted. For example, in 1890s Argentina 50% of the men were inscribed in the electoral registry and, among them, only half actually voted. In the early twentieth century nations began regulating voting more strictly to secure more democratic processes and avoid confrontations (Vommaro and Combes 2016).

Since those years, Mexico became a regional landmark by developing a highly authoritative kind of clientelism, in which patrons with local dominance exercise a severe control over clients. This clientelism is based on conditional access to resources, informal coercive sanctions, and the use or threat of physical violence against rivals. Often called *caciquismo*, this type of clientelism grew mainly in the rural areas of Mexico to then reach trade unions, universities, or squatter settlements in cities (Middlebrook 2009).

This sort of clientelism emerged in the early years of the twentieth century. Initially, bosses in many areas of Mexico controlled and protected their territories blocking the influence of national political conflicts in their localities. After 1940, however, the Mexican federal government – ruled by the Institutional Revolutionary Party (PRI) – relied on those local bosses to incorporate under its domination indigenous and isolated areas that had resisted state power. Those bosses became institutionally recognized local patrons that practiced highly authoritative clientelism and legitimized the state at the local level (Ugalde 1973). This authoritative clientelism reached Mexican cities through politically connected leaders that emerged as patrons in shantytowns imitating the culture of rural bosses.

Argentina has become regionally salient due to the particularly high prevalence and persistence of its clientelism. In 1945, the populist Juan Domingo Peron took power with great support of the working class. His government effectively connected with formal traditional civil society organizations. However, through the Eva Peron Foundation President Peron managed to modernize grassroots social assistance to reach informal, traditionally excluded sections of society – i.e., the poor, unemployed, women, and others. Peron's government incorporated and created local grassroots organizations that functioned as extensions of the state and whose leaders were loyal to the party in power. Since then, Argentinean political parties have constructed a thick network of grassroots clientelism that supports vulnerable families by providing them with food, medicine, and other basic supplies (Vommaro and Combes 2016).

Brazil presents a different Latin American case in which clientelism often combines with crime, marginality, and political corruption. Brazilian rural powerful landowners traditionally controlled groups of poor workers and negotiated their votes with politicians. In return, these landowners made demands to the state.

Clientelism became common practice in cities between the 1940s and 1960s. In those years, a number of policies sought to socially incorporate the poor living in squatter settlements through social programs. Many local improvements were then channeled through politicians in the form of clientelism. In the mid-1980s, poor urban areas experienced the influx of hard drugs. Traffickers created drug gangs, strengthened their leadership within the neighborhoods, and often provided assistance to neighbors. Crime and violence increased sharply as a result of gang confrontations and brutal police raids. Since the late 1980s, drug gangs increasingly engaged in electoral politics and in providing limited assistance to local residents. Eventually, drug traffickers began acting as authoritative clientelistic brokers in a highly corrupt political environment. In order to sustain safe control of their territory, drug dealers started making agreements with politicians who sought to secure their election in that area. In exchange, those drug traffickers gave limited assistance to residents (Arias 2006).

Going beyond this emphasis on citizens' access to the state, some analyses of Latin American clientelism have also focused on its potential to construct new community networks and to empower traditionally excluded groups.

Research in Argentina shows, for example, that the decay of industrial production and the expansion of the tertiary and informal sectors during the 1980s and 1990s strongly eroded the traditional collaboration between political parties and trade unions. During the 1990s, Argentinean poor urban dwellers grew poorer and increasingly excluded. Poverty sharply increased in most Latin American countries through the 1990s and early 2000s. High unemployment, vulnerability, and poverty in shantytowns disconnected people from community belonging and undermined local networks of help. Unable to resort to those local informal connections, residents turned to clientelistic networks to obtain food, medicine, basic goods, and services. These new connections promoted community construction and the production of new forms of belonging in marginal Argentinean neighborhoods (Auyero 2001). Evidence also suggests that residents in Uruguayan and Brazilian shantytown dwellers have been able to access urban services and even exercise rights through negotiations with patrons (Alvarez Rivadulla 2012; Gay 1990).

## Social Movements

Social movements in Latin America have responded to the democratic challenges that structural adjustments and austerity policies in contexts of high inequality impose. Many social movements have also reacted to the large social disparities that Latin America sustains since colonial rule. Movements have addressed ethnic, racial, class, and gender discrimination (Almeida and Cordero 2015).

For example, the Zapatista uprising in 1994, in Chiapas, Mexico, protested against the exclusion and poor living conditions that indigenous people were experiencing as a result of the government's economic and social policies. The Zapatista National Liberation Army (EZLN) called the North American Free Trade Agreement (NAFTA) a "death sentence." In their view, NAFTA undermines the development of Mexican indigenous communities. Similarly, in December 2001, Argentineans took to the streets marching and pot banging to protest against international pressures by the IMF, local austerity measures, political corruption, and bank freezes.

The efficacy of Latin American social movements to effect change often depends on their ability to take advantage of political opportunities. Yet, the distance between movements and political institutions can vary widely.

The Landless Workers' Movement (MST) in Brazil is one of the many examples of how social movements can coproduce effective social change in their close interaction with political authorities. With its origin in the land takeovers in the state of Rio Grande do Sul in 1979, the MST extended its initiatives in rural areas across the country to demand access to lands and dignity for poor rural workers. Eventually, the movement grew to become the largest in Latin America. In the early 2000s, the MST already organized in 22 states of Brazil. While rural land take overs are their main type of action, they also have a wide range of forms of activism – from carrying out parades in cities and towns, holding office, staging hunger strikes, among others. In addition, the MST participates in public rural schools though training teachers, building community-school connections, organizing teachers and students, contributing in the curricular design, and others. The effectiveness of their work in state local rural schools depends on the activists' ability to engage in coproduction with local authorities. In fact, Tarlau (2013) shows that engaging in political clientelism increases the movement's capacity to develop their work in rural schools.

Conversely, that case of the Chilean student movement is evidence of how the distance from political institutions can lead to more effective outcomes. Chilean students carried out massive protests in 2011. They claimed their right to free and public higher education. Students struggled against structural adjustment policies created in the 1980s that increasingly privatize universities and foster students' indebtedness. This movement carried out the largest marches since Chile's return to democracy in 1990 gathering around 500,000 people across the country. Hundreds of students painted their faces and danced to Michael Jackson's "Thriller" song in front of the presidential palace. Additionally, student leaders successfully defended their arguments in televised debates with local politicians. After several months of rallies and other collective initiatives, in October of that year the movement showed widespread approval among citizens (81%) (La Tercera 2011).

The Chilean student movement has become one of the most effective in pursuing policy change in Latin America. Analysts suggest that this outcome results from their decision to keep a prudent distance from political authorities (Somma and Medel 2017). In 2014, Bachelet's newly elected government began designing a group of reforms advancing student demands. Her government passed an ambitious tax reform to fund changes to the educational system. Later, in May 2015, congress approved Bachelet's Bill on Educational Inclusion, which bans profit making through educational institutions and forbids state-funded schools from assessing and rejecting children's admissions. She has also progresses to provide 60% of the poorest students with free higher education (Donoso 2016). Currently, other education reform bills inspired in this movement and designed by her government are under discussion in congress.

While several political sociologists explained how these Latin American movements have demanded their rights at the level of the nation state, other analysts have emphasized movements' ability to claim their rights by referring to other, alternative political communities. Successfully organizing against swindlers that sold them fake land rights, collectively struggling to avoid state eviction and self-building their houses, underprivileged urban dwellers in Sao Paulo claimed their place in the city. Not only were they successful in rejecting eviction. By defending and building their place as urban dwellers, poor residents have gone beyond the idea of the nation state to claim their citizenship rights. Consequently, through their mobilization urban dwellers create a new sense of dignity and belonging at the level of the city (Holston 2008). A similar analysis of squatter movements in central abandoned buildings, also in Sao Paulo, argue that activists rescale their demands of citizenship rights from the national to the urban level. Using transgressive, illegal occupations, Latin American urban dwellers claim their right to belong to the city (Earle 2012).

## Conclusion

Political sociology has studied the social determinants impacting political phenomena in Latin America. The descriptive analysis here provided shows the sharp, historically entrenched political inequalities experienced by the Latin American people.

Latin American economies have developed in growing dependence from more wealthy countries that is at the basis of many of its exclusionary policies. The structural adjustments and free trade agreements by which Latin American nations have opened their economies to the world foster vulnerability in the lower sections of their societies. Studies of Latin American elites demonstrate that national social structures have been historically unfit to accommodate the lower sections of society in the development of stable democracies. In consequence, populism and clientelism have prevailed in the relationship between political elites and the masses.

Social movements have reacted to these regional challenges. In the past couple of decades, we have seen a myriad of initiatives that take advantage of local, regional, or global political opportunities to effect social change and influence policies. The increased democratic stability that much of the region has experienced in the past couple of decades is, to a great extent, the result of the slow democratizing progress of civil society.

# Politician-Bureaucrat Relation in Ghana

Abdulai Kuyini Mohammed
Department of Political Science, University of Ghana, Legon, Accra, Ghana

## Synonyms

Administration; Bureaucrat-politician relations; Bureaucrats; Politicians; Politics

## Definitions

Because the public administrator is subordinate to the elected executive in both law and practice, the latter tends to subject the former to political control. The former also believes because of its expertise it should be assertive and influential in its area of purview. The pursuit of these rival

stands results in tension and conflict between the two categories of officers. However, there is latitude for collaboration and reciprocal influence between the two parties. This paper investigates the precise nature and consequences of the relations between elected executives and the administrative experts in the Ghanaian context.

## Introduction

Governance is a collective enterprise requiring good relationships between all the stakeholders represented in a polity. These stakeholders include the government and the governed. There are two groups of actors in the government realm, that is, politicians and bureaucrats. These public functionaries should not only have a good working relationship with each other but also with members of the public or the governed. This is essential for engendering participation, trust, and consensus building response to the needs of citizens (Dasandi 2014). It is only when the relationship between the bureaucrat and the politician is good will they be able to jointly craft solutions that will be efficacious in dealing with societal problems. Good service delivery enhances the legitimacy of, and trust of the people in, their government.

Perhaps that is the reason why the relationship between politics and administration has been one of the most popular themes in public administration discourse since the works of Woodrow Wilson and Max Weber. Over a long period, the leading notion was that there was, or at least should be, an explicit division between the realm of politics and the domain of administration (e.g., Mouritzen and Svara 2002). Several important scholars of public administration like Campbell (1983), Peters and Pierre (2004), and Svara (2001) have claimed from a normative standpoint that such a neat distinction is difficult, this contrasting view is supported by several empirical works from diverse perspectives and specialization which indicate a wide, though varying, interconnection between the two spheres (see, e.g., Kingdon 1995; Mouritzen and Svara 2002). Yet, irrespective of which side of the debate one stands (i.e., distinction or interlinking of the political and bureaucratic worlds) and as Dasandi (2014) observes, political-bureaucratic interaction can be very important in promoting development, as well as hindering it.

The remit of this paper is to investigate the politician and bureaucrat relations in Ghana from the immediate post-independence period in 1957 to the current period. The analysis focuses on determining (1) the nature of the relations, that is, whether warm or frosty, (2) the factors that are responsible for the observed relations, (3) the consequences of the relations, and (4) the measures that can be taken to engender good relations between politicians and bureaucrats.

The paper proceeds by first sketching the changing complexion of government in Ghana's history as an independent nation. Next, it expounds on the methodology of the study before considering the nature of the politico-administrative relations across regimes. It then analyzes the consequences of the politician and public administrator relations for the conduct of public business. The final section is devoted to suggestions for improving the relations between the politician and the bureaucrats and conclusion.

## The Methodology of the Study

The empirical basis of this study is 50 elite interviews and secondary evidence. The interviewees were selected because of their expertise and/or experience as past and current career politicians and bureaucrats. The respondents included 10 retired civil servants, 20 current civil servants, 5 former ministers, 5 current ministers, and 6 academics. The secondary information included published academic works on politicians and bureaucrats relations as well as media reports and departmental newsletters. The primary information corroborated the secondary evidence and also captured certain nuances that could not be revealed by the published works. This increased the credibility of the findings and conclusions and generalizations that have been drawn from the study.

## Nature of Politico-Administration Relations Across Regimes in Ghana

It is important to sketch the historical antecedents of the interface between the elected and appointed officials in Ghana. This will serve as a backdrop against which the nature of the subsequent relations between the two categories of public officeholders will be understood. As Nti (1976: 3) opines, "one cannot explain change or continuity except in terms of history." The historical background will facilitate understanding of the shifting nature of the relationship as affected by the political turbulence that Ghana has witnessed since its emancipation from colonial rule. The historical backdrop will also assist in elucidating the goals of the series of public sector reforms that have been launched over the years and their impact on the interactions of the two categories of public officeholders in the conduct of public business.

The bureaucracy as it existed in the colonies in Africa was predicated on the Weberian model of public administration (Ayee 2013). During the colonial era, expatriate bureaucrats occupied the apex of the public administration system, while natives were situated down the hierarchy. At the advent of independence, there was the need to replace all expatriate bureaucrats in an effort to dismantle the residual apparatus of imperialism under a policy known as the Africanization of the civil service and the pursuit of rapid socioeconomic transformation (Adarkwa and Ohemeng 2015). The relationship between elected and appointed officeholders in independent Ghana was, and is still, characterized by this milieu (Gyimah-Boadi and Rothchild 1990).

The relationship between the politician and the bureaucrat in the period between 1957 and the end of the Nkrumah's regime in 1966 and even beyond is aptly described as one of master and servant (Ayee 2013). The elected officers dominated the conduct of public affairs including public policy making, and this dominance has persisted to date. Bureaucrats continue to be precluded from the public policy making process. One of the important ways that was applied to exclude public administrators from public decision-making processes was through the establishment of executive or presidential commissions, which were separate from and external to the civil bureaucracy. These commissions crafted policy proposals and workable solutions to public problems to herald parliamentary consideration, executive acquiescence, and concretization into projects and programs (Ohemeng and Ayee 2016).

The desire to achieve rapid socioeconomic transformation within the shortest possible time in order to improve the living conditions of Ghanaians necessitated the reorientation of the bureaucracy toward political freedom. This engendered a hostile relationship between politicians and bureaucrats (Amonoo 1981). Elected officials arrogated to themselves the design and execution aspects of the policy making process leading them to have an urge over public administrators in both realms. The alienation of the latter bred resentment and led to distrust between the two categories of officials during the reign of Dr. Nkrumah-led CPP government. The frustration of Dr. Nkrumah especially about the bureaucracy stemmed from the fact that it was considered too slow to act – a perceived attribute which was thought to be undermining the achievement of the political goal of rapid socioeconomic development (Gyimah-Boadi and Rothchild 1990). Accordingly, this fed the impetus for the extreme politicization of the bureaucracy, with occupants of the top echelons of the hierarchy being replaced as heads of institutions by party members. This view corroborates Gyimah-Boadi and Rothchild who aver that Dr. Nkrumah resolved that, "he would see to it that there were no 'civil masters' as under colonial rule but civil servants carrying out the policy decided by the cabinet" (Gyimah-Boadi and Rothchild 1990: 233). The two scholars assert that "senor officers were regarded with suspicion," which culminated in their loyalty being thrown into question. The Nkrumah's regime ensured that the bureaucracy was firmly brought under the control of the political executive.

An effective strategy Dr. Nkrumah's administration adopted to bring the bureaucracy firmly under political control was the establishment of several parallel bureaucratic apparatuses, to

carry out national development (Amonoo 1981). These parallel bureaucratic structures included state-owned enterprises, specialized secretariats like State Planning Commission, the Productivity Center, the Water Resources and Power Secretariat, and the Civil Service Commission. All these institutions were outside the regular public services and brought under the Office of the President, who exercised direct control over appointments (Ohemeng and Anebo 2012). This deteriorated the already frosty relationship between bureaucrats and the Nkrumah's government because it not only over-politicized the public service, but it also created coordination problems for it in national development efforts. This was because some of the organizations and sectors became silos which grossly undermined sociopolitical and economic growth (Ohemeng and Ayee 2016). Accordingly, an administrative confusion was created for the state, a labyrinth which Amonoo (1981) aptly characterized as "the politics of institutional dualism."

By 1966 when Dr. Nkrumah's government was overthrown, the relationship between the politician and the bureaucrat was one of "uneasy tension" (Adarkwa and Ohemeng 2015: 15), with the latter more or less relegated to the background in terms of voice possession in the setting of an agenda for national development (Amonoo 1981).

From the fall of the Nkrumah's regime in 1966 to 1981 when the Rawlings-led Provisional National Defense Council (PNDC) took over the reins of government, there was considerable turbulence in the relationship between elected and appointed officers. Government successions were frequent principally via military takeovers with the exception of the late 1969 to early 1972 and from September 1979 to December 1981, when civilian governments ruled. Like in the Nkrumah's time, public sector reforms were also undertaken in this period that adversely affected its effective functioning and performance. The reforms alienated the bureaucracy from the public policy making process mainly because the political decision makers were ambivalent about the dedication and loyalty of public administrators (Adarkwa and Ohemeng 2015; Asante 2005) The sore relationship between the politician and bureaucrat was exacerbated by economic stagnation which fed corruption particularly in the civil service and dented the image of the bureaucracy.

The National Liberation Council (NLC) was the first military regime in Ghana, which toppled the Nkrumah government in 1966. Initially the NLC attempted to depoliticize the civil service. It made strides to create a cordial relationship with public administrators by substituting politically appointed regional and district commissioners with administrators who were civil servants (Gyimah-Boadi and Rothchild 1990). In respect of economic policy making, the military junta enticed the participation of the bureaucracy in conjunction with the business community in the NLC's National Economic Council (NEC). The council exercised control over economic policies. The membership of NEC included five senior civil servants and two financial professionals. The governing style of the NLC and NEC, according to Kosack (2012), was reminiscent of the approach of the British. That approach ensured that public administrators were at the center and administered at the local level via alliances with tribal chiefs and through central appointed bureaucrats.

Nevertheless, all was not rosy in the politico-bureaucratic relationship as there were instances when the junta expressed frustration with the bureaucracy. For example, the junta deplored the tardiness of the civil service and its lack of a sense of urgency in the implementation of public policies. Lt. Gen. E. K. Kotoka, a key member of the NLC, complained that "things don't go as expected in the civil service." Lt. General Ocran, another member of the NLC, also complained that in his ministries, unlike the army, the line of authority was ill-defined and diffused and civil servants often did not know who was responsible for what (Pinkney 1972).

The impatience which succeeding governments had with the civil service may be attributed to the fact that the service was seen as the main vehicle for promoting socioeconomic programs, which all governments unsuccessfully tried to implement. The vagueness of some of the policies of governments may itself help explain why the governments complained of bureaucratic

sabotage and tardiness in the implementation of public policies and programs. The governments themselves failed to clearly spell out what their policies were, and civil servants had to spend much time in deciding which policies appeared to be the most suitable. Even when the aims of the policies were clear, the difficulties in achieving them were not always understood by the governments (Pinkney 1972).

The politician-administrator interface during the Busia's regime (1969–1972) was similar to what obtained under the NLC rule. The period witnessed bureaucrats as cornerstones in sectoral public policy making particularly economic policy. Similar to the NLC regime, these technocrats were drafted externally including those who had worked with the World Bank and the IMF (Libby 1976). It was clear that the policy terrain was dominated by politicians and bureaucrats from international governmental organizations, which led to loss of policy ownership by local decision makers (Libby 1976).

Although the bureaucracy was over-politicized during the Busia regime, the period did not record any major tension in the relationship between the elected and appointed officers until the dismissal of 568 civil servants. While the government cited incompetence and inefficiency as the reasons for the dismissals, many observers believed they were politically motivated. The political motivation thesis is supported by the fact that a disproportionately large fraction of the dismissed was sympathizers of the Nkrumah's regime (Frempong 2007). The court order to reinstate the dismissed public servants was ignored by the government, and this destroyed the cordial relationship that existed between politicians and bureaucrats. Moreover, the government's quest to enhance efficiency and productivity in the economy via austerity measures as well as cost imposed on the civil service further alienated the bureaucracy and exacerbated tension between the political and administrative worlds.

The relationship between the politician and the administrator during the PNDC rule was the most difficult and rancorous. Before the advent of the PNDC, the civil service had witnessed most critical and trying times that arose mainly through the economic crisis that plagued Ghana from the 1970s. From 1974 to the early 1980s, the Ghanaian economy was in decline, unable, for a combination of structural and policy-based reasons, to seize the initiative and overcome the constraints on choice (Rothchild 1991). Declining agricultural and industrial productivity, in some cases despite rising international market prices, contributed substantially to the country's economic malaise during the 1970s and 1980s. The consequence of the economic downturn for the civil service was the erosion of its pay through hyperinflation which led to its cream of the crop leaving the country to escape the harsh economic realities and to seek greener pastures (Adarkwa and Ohemeng 2015). The skeleton staff who remained found the task of administration overwhelming, and this made it quite formidable to deliver basic services. Nti (1978:2) characterized the civil service at the time as "a moribund paper pushing institution" to perhaps presage the inefficiencies and ineffectiveness that bedeviled it.

The PNDC partly blamed the bureaucracy for the inefficiencies and ineffectiveness in the conduct of public business and for the socioeconomic development problems of the country. This negative opinion formed about the bureaucracy defined its relationship with the government. Not surprisingly, when the government launched its economic recovery program of 1983, the civil service and especially those at the echelon of the service were precluded from the design and even the execution of the program's critical parts (Adarkwa and Ohemeng 2015).

The PNDC envisioned that for the civil service to be effective it needed a transformation which would remove the bad nuts, reorient its culture, sharpen its skills, and enhance its responsiveness to public service customers. Accordingly, many civil servants were summarily dismissed, while others were accused of corruption and incompetence. Those who were accused of corruption were arraigned before the freshly constituted public tribunals and slapped with long prison sentences (Gyimah-Boadi 1994).

The PNDC maiden reform was kicked started with the setting up of the Kaku Kyiamah Committee in May 1982 with a mandate to advice

the junta on restructuring the bureaucracy (Adarkwa and Ohemeng 2015). Among others, the committee recommended that the civil service should (1) restrict itself to policy formulation, (2) provide the administrative support units for political heads, (3) coordinate and monitor programs and activities within the ministerial sector, and (4) conduct interministerial relationships. In addition, it advised that, "the politicization of the position of the principal secretary" was in order. This, the committee reasoned, was due to the fact that some of the principal secretaries cultivated the habit of "resisting or blocking the flow of professional advice direct to the political head" (Wood 1984: 46). This charge, however, was untenable because the committee could not produce any solid evidence to back its claim (Wood 1984). Another suggestion it tabled was the obtaining of advice from plural sources both external and internal. From the internal sources, all heads of directorates in a ministry were to be permitted easy and equal access to tender advice to the political head.

The recommendations attracted a receptive political ear which triggered some structural changes, embracing the redesignation of the position of principal secretary to that of chief director. The chief director was appointed on the basis of both merit and partisanship. Ascension to the position was no longer to be based on career progression in the service, but outsiders were also eligible for consideration for appointment (Barnes 2014). By these changes the bureaucrats felt debased, and this fed the already frosty relationship that generated between it and the regime following the mass dismissals and imprisonment of some of its members. This bitter relationship even got worse when the government established revolutionary organs.

The relationship was further ruined by the establishment of revolutionary organs which were variously labeled as People's Defense Committees (PDCs) and Worker Defense Committees (WDCs). These PDCs and WDCs were established in various cities, towns, and workplaces, including the civil service. The WDCs were created with a mandate to assist in the development of government policy. They enforced price controls and curfews, supported rent controls, and investigated malfeasance in public and private sectors (Adarkwa and Ohemeng 2015). In contrast, the PDCs were formed under the directorate of a coordinating committee that comprised representatives from all the reformist political organizations. Their establishment represented an aspect of the regime's schema to introduce new layers into the structure of the planning and implementation of government programs. In this way, it was envisioned that it would decentralize the administrative structures. The PDCs were meant to organize development programs in factories, banks, and institutions as well as serve as vigilantes for the government (Adarkwa and Ohemeng 2015).

The new democratic dispensation which was ushered in on January 7, 1993 preceded the multiparty contest which saw the National Democratic Congress (NDC) assume power. Since then to date, the country has witnessed three alternations of power: the NDC ruled from 1993 to 2000, and handed over power to the New Patriotic Party (NPP) (2001 to 2008), the NDC regained power and ruled from 2009 to 2016, and the NPP snatched power and ruled from 2017 to date. Since the PNDC metamorphosed into NDC, many people across all walks of life, including civil servants, believed the latter's rule was a perpetuation of the former's, and this affected the politico-bureaucratic relationship.

The most telling effect on the relationship between the government and the civil service is the constitutional provision that bars civil servants from openly participating in political activities. A similar provision is in the Civil Service Law of 1993 and Civil Service Code of Conduct of 1993. Under the last two laws, bureaucrats are supposed to demonstrate neutrality in political affairs. The numerous public sector reforms that have been introduced and continue to be introduced have served to continually redefine the relationship between the politician and the public administrator. As noted earlier, the constitution and the public sector reforms have vested the president with vast powers of appointment. His power to appoint the head of the civil service and chief directors of the various ministries conflicts

with the arrangement in the civil service where directorship is attained via career progression. The reforms thus served to anger bureaucrats who believe that professionalism, dedication, and hard work may play second fiddle to partisanship as a criterion for progression on the career ladder.

## Impact of Politician-Bureaucrat Relations

This section examines the consequences of the tenuous relationship between the elected and appointed officers on the conduct of public business especially in respect to policy making. The impacts that are discussed here include over-politicization of the civil service, high rate of bureaucratic attrition, mistrust of the public administrator, organizational disloyalty, and the civil service unattractiveness as an employer of choice.

The primary information now being explicated here is in tandem with the secondary evidence discussed about the over-politicization of the civil service in Ghana since independence in 1957. Respondents were asked whether they thought the civil service was over-politicized. A majority 89% answered in the affirmative, 9% responded in the negative, while the remaining 2% could neither confirm nor deny that it was over-politicized. Those respondents who said it was over-politicized were then asked to cite examples or instances of the over-politicization. One serving senior bureaucrat said, "in the second term of President Rawlings's administration five of my colleagues told me that their political bosses asked the Office of the Head of Civil Service (OHCS) to transfer them without assigning tangible reasons." A retired public administrator revealed with anguish that, "my minister told me blatantly that he could not work with me because I don't fear to tell truth to power." He added, "the minister said the strict adherence to my professional ethos had almost become a dogma." A third bureaucrat said, "the politicians will always assign you a party whether or not they have basis to confirm their perception." He continued, "the perception of a bureaucrat's political leanings becomes the basis for promoting or jeopardizing his or her professional career." A fourth public administrator lamented that, "I was transferred from a metropolitan council to a remote rural district following the change of government from the NDC to the NPP in 2017." "My transfer, I believe, was not based on competence or conduct but on my political affiliation." A fifth bureaucrat said, "I applied for early retirement to safe myself the embarrassment of having a confrontational working relationship with my political boss." A sixth technocrat lamented that, "as a person the minister himself was well mannered and had a collegial attitude but pressure from above reluctantly made him to give me a cold shoulder because of his induced-reading of my political leaning." But "this treatment of civil servants is regrettable because as bureaucrats our work is inherently political." Christensen and Laegreid (2004) agree, arguing that the public service can never be fully apolitical because bureaucrats, in delivering a public service to the citizens, inevitably participate in the political role of "deciding who gets what" from the public sector. The outcome of the over-politicization, as one minister acknowledged, is that, "the politician and bureaucrat are not able to engage in frank exchanges that will produce the good ideas to serve as building blocks for policy development."

Respondents were asked to indicate what the effect of the bitter relationship had on the bureaucrat. Eighty-eight percent pointed to high turnover rate of especially top bureaucrats. One academic intimated that, "many bureaucrats want the freedom, space, and reciprocity that enable them to perform to the best of their ability." He added that, "if they feel these conditions are not prevalent in the civil service they may either resign or take their services elsewhere." A retired bureaucrat concurred, saying that, "I had to resign because I could not bear the frustration of having to be instructed to do things that tended to serve partisan interest rather than the public interest." A third technocrat said, "I was forced to resign and I took up an appointment in the private sector because every action or omission on my part was read with political lenses." He elaborated that, "the level of suspicion was too high, and this made me hesitant

in taking even the most mundane administrative decisions because of the political connotation it would be given."

This evidence speaks to Adarkwa and Ohemeng's (2015) assertion that, there are two types of bureaucratic turnover: the first is forced where the bureaucrat who cannot cope is compelled to proceed on early retirement; the second entails moving the public administrator to a different and usually less glamorous ministry. The first is commonly suffered by those occupying the positions of the head of the Civil Service (HoCS) and chief director and even sometimes those in positions a step lower than the chief director, that is, director. To illustrate, in the 8 years (2001–2008) that the NPP was in power, the "HoCS changed multiple times, with no one spending more than two years." Others were "designated as 'acting' with no clear timetable for their confirmation or removal" (Adarkwa and Ohemeng 2015: 23). Likewise, when the NDC assumed power in 2009, the HoCS position was subjected to the same turbulence. Such rampant changes make organizations headless that proceed in no particular direction – a state of affairs that is inimical to planning and development.

At the Director level, some bureaucrats who are distrusted by their ministers choose an alternative to quitting, that is, simply succumbing to the wishes of the politicians. The deference to the politician occurs irrespective of whether this offends bureaucratic professional ethos or is inimical to the public interest. Consequently, when an administrative problem crops up, there is passing of buck as it becomes quite formidable to pinpoint who should be held responsible (Barnes 2014).

The effect of such high bureaucratic turnover rate, according to some interviewees, is the loss of policy direction of public organizations. Undoubtedly, stability is essential for incisive and vigorous policy direction and implementation. Another problem with the high turnover rate is that it creates fear and anxiety among public administrators, eventually making bureaucrats to lose confidence and in extreme situations disturb their mental balance – both of which are prerequisite to sound policy development and implementation. One informant intimated that, "rampant transfers of chief directors to different regions and districts render sluggish or ineffective the execution of a ministry's policies, projects and programs." This is because, reasoned another interviewee, "incoming chief directors require reasonable length of time to get acquainted with the new office and its processes, techniques, and procedures and how these generate throughput." A third respondent lamented that, "outgoing chief director's" handing over notes are usually hurriedly prepared and are therefore often wanting on content especially as a source of lesson drawing and guidance." A bureaucrat who was recently transferred from Accra, the national capital to Wa, the Upper West Regional capital, lamented that, "such unnecessary transfers is detrimental to the creation of a workforce that is built on rapport, comradeship and team spirit." This is because, argued another respondent, "the new bureaucrat does not have the length of time needed to study skills, competence levels and personal dispositions of his staff in order to match them to specific tasks." In general, frequent and unnecessary changes of top bureaucrats, just like ministers, undercut the efficiency and effectiveness of the civil service. Some writers concur, insisting that the turnover of personnel in the public service has created an experience and expertise lacunae, which has tended to affect the capacity and capability of the public service to deliver its core mandates (Antwi et al. 2008).

As noted earlier, the high turnover rate, whether it occurs as a transfer or retirement of the public administrator, has several ramifications. In particular, if transfers occur at the behest of the political head, a fresh round of animosity, suspicion, and mistrust awaits the bureaucrat at his new destination. This is because the alleged reasons for the transfer would have been revealed to the political boss at the receiving ministry and would have made the rounds among staff. Consequently, bemoaned one chief director, "the political head mistrusts you and precludes you from important decision arenas as well as arrogate to himself the routine bureaucratic tasks of drafting legislation and preparing policy proposals." Barnes (2014) agrees, arguing that political heads in such instances attempt micromanaging the

ministry and in the process leave out important tasks that form the core mandate of the ministry, department, or agency. In addition, the transferred bureaucrat is unable to establish a good working relationship with his subordinates chiefly because the politician bypasses him and assigns high-level managerial functions to his juniors. This makes the subordinates to disrespect the chief bureaucrat. Another respondent lamented that, "the consequence of the alienation is that it breeds uncertainty, fear, inferiority complex and a sense of resignation on the part of the bureaucrat." A third interviewee concurred, averring that, "the mistrust of the chief bureaucrat by his subordinates and the politician makes him unable to have a handle on the ministry, department or agency." This, he added, "on some instances have led to throwing the leadership and professional competence of the bureaucrat in doubt."

A frosty relationship between the politician and public administrator sometimes leads to the latter's disloyalty toward both internal and external customers of the civil service. The internal customers include the politician and fellow bureaucrats, while the external customers comprise members of the public. In the absence of loyalty, it is difficult for the bureaucrat to remain dedicated and committed and uphold professional ethos as well as strive to do good for the public interest.

According to Hubbard and Paquet (2007 cited in Adarkwa and Ohemeng 2015), disloyalty as far as bureaucratic behavior is concerned can be categorized into two groups. The first is *passive disloyalty* which implies responding to the minimalist interpretation of what is anticipated and obligatory. This interpretation is reductionist in the sense that the responsibilities of a position are scaled down to a level much less than it should be. The second is *active disloyalty* which denotes the intentional undermining of the work of superiors and/or betrayal of the trust of partners and citizens. Although both types of disloyalty are discernible in the civil service, it is the latter that is relatively common. To Hood (2001) *active disloyalty* embraces the divulging of confidential material or policy proposals to journalists or opposition parties by discontented public administrators and other kinds of policy sabotage.

In the context of Ghana, both kinds of disloyalty are identifiable in the bureaucracy. According to one academic, "the posturing of some ministers instilled in the bureaucrat a hesitant approach to public business." One director in a ministry revealed that, "some bureaucrats out of frustration engaged in bureaucratic espionage that is, selling organizational confidential information to opposition parties and journalists." One informant, for example, said some "bureaucrats gave copies of government assessment report of the performance of the National Health Insurance Scheme (NHIS) to the then opposition NDC in the buildup to the 2008 elections." This probably was, reasoned another senior officer, "the NDC government's retaliatory measure to a similar move by the then opposition NPP in the run up to the 2000 general elections when government information was leaked to it." In this case, a draft report of the auditor general was clandestinely obtained by a ranking member of the minority in the parliament (Adarkwa and Ohemeng 2015).

An employer of choice is an employer who offers a work culture and workplace environment that attract and retain superior employees. An employer of choice refers to establishing an organization that is a great place to work. If organizations do not legitimately act to become an employer of choice, then good employees will simply vote with their feet and move to look for an employer who offers them what they want. The essence of becoming an employer of choice is the quality of the employment relationship or psychological contract. Employers of choice have created a culture that is based on a new employment relationship. That relationship is more collaborative and more open than the old "them and us" relationship.

Eighty-five percent of the respondents thought that the frosty relationship between politicians and bureaucrats does not make the civil service an employer of choice. As one interviewee bemoaned, "prospective employees with superior skills hear stories about the antagonistic relationship between politicians and bureaucrats and this puts them off." Another respondent averred that, "bureaucrats with the best competences, experience and personal disposition quit the civil service leaving only suboptimal staff to do the

bureaucratic work." He added, "that is the reason why service delivery is poor, responsiveness is lacking and corruption is rife in the civil service." A senior officer agreed, arguing that "bureaucrats are the main source of innovative policy ideas, the cornerstones in sectoral policy making, and without whom policy implementation becomes ineffective." He added, "all these negatives have occurred and will continue to occur in the civil service because of the tenuous working relationship between the politician and the bureaucrat."

## Conclusion

In Ghana the frosty relationship between politicians and bureaucrats is attributed largely to the parties' inability to recognize that their supposedly separate roles have a junction or overlap. In other words, the modus operandi continues to be based on the dichotomy or separation model. Such a mindset has been recently exacerbated by the New Public Management (NPM) through the call for political leaders to choose their agency heads in order to overcome what advocates refer to as the overwhelming power of the bureaucracy. However, as in Ghana some scholars have noted that the NPM is seen by political leaders in Australia, the United Kingdom, and the United States as a reassertion of political control over the career bureaucracy. The proclivity toward political control is certainly not novel; however, the thing that distinguishes this trend in Ghana is that it has led to stubborn conflicts between politicians and public administrators. This rancorous relationship has had implications for public performance, productivity, and effectiveness which together have fed a legitimacy crisis. The conclusion is that politicians and bureaucrats everywhere must understand that their roles are inevitably complementary. And that antagonism between them and their solo pursuits will not engender accelerated national development.

# Politicization and Social Mobilization in Twenty-First-Century Chile

Simón Escoffier
Instituto Chileno de Estudios Municipales, Universidad Autónoma de Chile, Santiago, Chile

## Synonyms

Activism; Chile; Democracy; Social movements

## Introduction

This chapter looks at current Chilean politicization and social mobilization. Questioning the traditional divide between authorities and social movements (see e.g., Tarrow 2011), a set of publications devoted to this issue in Latin America has explained grassroots collective action as a coconstruction between movements and political institutions. Political phenomena in Latin America hardly function in isolation, these scholars argue (Alvarez et al. 2017; Helmke and Levitsky 2006). Instead, they suggest that political processes interconnect to produce outcomes that may or may not be democratic. Tarlau (2013) has studied, for example, how the Landless Workers Movement (MST) in Brazil coproduces activism with political parties in rural schools through clientelism. By showing how Chilean social movements have increasingly detached from political institutions, this chapter will outline the Chilean case as a regional exception. In fact, often, disengagement from institutional politics among Chilean social movements has proven more effective in effecting policy change.

The chapter firstly explains the conditions by which Chilean society became de-politicized during its democratic transition in the 1990s. Civil society deactivated and people grew increasingly disconnected from institutional politics. Secondly, this work pays attention to Chile's reactivation of social mobilization in the 2000s. Finally, the chapter explains the tactics by which movements have built policy change despite their relative disconnection from political institutions.

## Dictatorship and Demobilization

Unlike most other countries in the region, Chile enjoyed a representative party system as well as stable institutions for most of the twentieth century. Additionally, Chilean society evolved through a strong politicization. Until the 1970s, political party membership was very prevalent in Chile and permeated economic, social, and cultural life. Chilean party politics and social movements were closely interconnected. Nevertheless, this stability and political developments were to be abruptly interrupted (Garretón 1989).

Elected in 1970, President Salvador Allende implemented an intensive socialist reform that included nationalizing large-scale companies, intensifying land reform, and creating a unified social security scheme funded through tax reform.

Increasing polarization and international pressures diminished the country's stability. On September 11, 1973, General Pinochet's military coup d'état overthrew Allende's government. The 17-year-long dictatorship (1973–1990) that followed had a profound impact on Chilean society.

Pinochet's dictatorship suppressed freedom of speech and repressed political dissention – i.e., it persecuted, tortured, killed, and exiled those people in opposing movements. Consequently, it undermined people's disposition to participate in collective action and protests. Nevertheless, despite these barriers, civil society called for the restoration of democracy. Mobilization occurred in direct connection with supportive political institutions during the dictatorship. Center and left wing political parties – especially the Socialists, the Communists, and the Christian Democrats – worked clandestinely coordinating resistance across the country. The Vicariate of Solidarity – an office created by progressive Catholic priests to protect victims of state terrorism – also supported resistance initiatives. Similarly, local NGOs – funded by international agencies – backed and assisted activists. Between 1983 and 1986 Chile experienced massive national protests that challenged the authoritarian regime and gave the struggle against human rights violations international visibility (Bastías Saavedra 2013). Citizen organizations of all sorts – labor unions, students, transportation workers, human rights defenders, social housing committees, and many others – united in protest.

After talks with center and left-wing politicians, the military government agreed on carrying out a constitutional national referendum in 1988 to decide on the continuation of the dictatorship. Massive referendum campaigns, again, brought together political parties and grassroots organizations. Famously, the "NO campaign" was victorious in rejecting dictatorial rule. This campaign boosted electoral turnout by engaging many thousands of people with little or no political experience in grassroots electoral activism.

In 1990, the country formally regained a civilian democratic government. Arguably, a new window of political opportunity opened for social mobilization to flourish further. Reportedly, however, Chilean people became depoliticized and civil society strongly deactivated during the 1990s. This unlikely trend resulted from a twofold effect. On the one hand, the democratic transition brought a set of contingent events. International agencies withdrew their supportive funds from grassroots initiatives, the Vatican imposed increasingly conservative policies to its sections diminishing the Chilean Catholic Church's support for local activism, and many leaders abandoned civil society to take government positions (Bastías Saavedra 2013; Delamaza 2015).

On the other hand, the political system de-incentivized social mobilization. The political system inherited from the dictatorship made it extremely difficult to carry out substantial reforms that could undermine Chile's highly elitist society. Several "organic" laws fostering the commodification of social rights and boosting inequality required "supermajorities" to be modified in congress. Also, by electorally benefiting the two largest coalitions – the Concertación (center and left-wing) and the Chilean Alliance (right-wing) – the binominal electoral system gave overrepresentation to right-wing politicians in the parliament and electorally excluded independent groups that threatened the entrenched political class. This political deadlock eroded the credibility of the political system imposing a powerful barrier to movements seeking to effect policy modifications (Luna 2008; Ortega Frei 2003).

Additionally, political parties in power sought to purposively deactivate contentious collective action. Concertación politicians, for example, saw social movements as a destabilizing force for the newly established democratic regime (Hipsher 1996; Paley 2001). In addition, a deepening of the dictatorship's neoliberal policies by the new democratic governments reinforced an increasingly individualistic culture that had been forming since the 1980s. Used to behave as consumers, people became increasingly accustomed to think of their success only in personal – and not collective – terms. This new prevailing identity undermined all sorts of collective action (Silva 2004). It would take a while for social movements to challenge this national political configuration.

## The Return of Politicization and Mobilization

After a period of transitional social acquiescence, Chilean society began reactivating. In the early 2000s, reports show, people used the readiness and availability of consumption to draw a more positive future. Chile's per capita GDP had doubled in the past decade and the center left coalition in government since 1990, the Concertación, had managed to progressively increase investment on social welfare programs. As a result, Chile's Human Development Index was the highest in the region. These conditions progressively inspired people to seek higher life standards as well as new social horizons. Simultaneously, however, the Chilean economic model grew sharply inegalitarian. Inequality became increasingly evident in multiple areas. Highly commoditized, Chile's educational system diminished public schools and became increasingly segregated. Similarly, inequality undermined most other social services such as health, housing, and pensions (UNDP 1998).

In April 2006 Chile saw the reawakening of its social mobilization. While small numbers of activists had persistently mobilized over labor, housing, environmental, and indigenous rights claims, in April of that year secondary students initiated a set of protests that took the political establishment by surprise. At first, what became known as the Pingüino Revolution – due to their black-and-white uniform – demanded the improvement of educational infrastructure and the prompt delivery of school transport passes. However, the movement soon grew and staged large demonstrations that clashed with the police and had more than a thousand students arrested in early May. Their demands then included a wide range of issues, from freezing transportation costs and food allowances to the most vulnerable students, to structurally reformulating the educational system to strengthen public schools and battle inequality. Facing the government's inaction, more than 130,000 secondary students paralyzed hundreds of schools through a wave of sit-ins. Although Bachelet's government initiated a set of consultations with student and teacher organizations, the resulting package of reforms presented to the parliament in 2009 did not address their main concerns.

Arguably, however, the Pingüino Movement represented a new, incipient process of politicization in Chile. Learning how to strategically lease with authorities and building a more inclusive internal organizational structure, secondary students managed to obtain widespread support from the public opinion (Donoso 2013). Thereafter, protests grew persistently in every section of society, both in frequency and in participants (Somma and Medel 2017, p. 35). Perhaps more importantly, however, secondary students displayed two traits that would qualitatively define the legitimation and effectiveness of movements in the mobilizations of the following decade: a disengagement from institutional politics and the use of tactics to effectively pursue policy change.

While much of the traditional social movement theory has argued that protests thrive in closer connection with polity members (see e.g., McAdam 1982) the Chilean case shows that distance from political institutions can also enhance mobilization (Von Büllow and Donoso 2017).

In fact, several high school secondary student leaders in 2006 were closely connected with the Socialist and the Christian Democratic parties. However, they kept their organizational autonomy despite parties' efforts of movement cooptation.

When the student movement took to the streets again, in 2011, leaders excluded political parties from their work. With its peak in July–August 2011, this new wave of protest incorporated higher education students, attracted many more protestors from other grassroots organizations, and had a larger impact in Chilean public opinion. Twenty-three massive protests were held in Santiago and other major cities throughout the country between May 2011 and September 2013.

Most of the main leaders did not belong to political parties. Reportedly, those leaders who belonged to parties either quit their party membership or actively rejected party directives. The connection with political parties became a

deterrent for group legitimation within the movement (von Bülow and Bidegain Ponte 2015).

This cultural shift affected activists in most other Chilean social movements. In fact, movements have increasingly avoided obtaining resources from political parties. Environmental and LGBT movements get most of their funding from international organizations and foreign governments. Exceptionally, they receive money from individual private donors. Smaller, environmental organizations obtain their human resources and funds from the local community and, exceptionally, from local governments. In the core of student activism, University federations receive most of their funds from their universities (Somma and Medel 2017). Most neighborhood organizations in underprivileged areas obtain a percentage of their funds from their local government participatory funds. Most of their resources, however, come from fundraising events that boost their local identity and sense of community (Koppelman 2016).

Movements' rhetoric strategies have also reacted to and rejected political parties. A myriad of movements – i.e., environmentalists, workers, students, the Mapuche people, and others – have highlighted Chile's persistent inequality as well as politicians' role in promoting profit-oriented policies. These elements function as explanatory factors boosting a large neoliberal machinery that curtails people's access to social and cultural rights. Criticizing these policies as anchored in the dictatorship's authoritarian neoliberal project has proved highly effective for politicizing larger sections of society. This diagnostic conceives political institutions as key protagonists of a model fostering privilege over right. In consequence, movements tend to only instrumentally connect with political parties securing their autonomy to define goals and tactics (Von Büllow and Donoso 2017).

Thanks to their tactical approach Chilean social movements have been effective in pursuing policy change despite their distance from political institutions. The student movement has successfully pushed for policy modifications in different opportunities. Largely, its effectiveness can be attributed to their competence to convince public opinion of the urgent need for educational reform. Although the new General Law of Education (LGE) implemented in response to the student mobilizations in 2006 did not address many of their demands, it advanced toward a more inclusive and regulated school system. Student protests in 2011–2013 saw Piñera's government increasing funding for education and lowering state student loans interest rates considerably, from 6% to 2%. Later, in 2016, Bachelet's second government passed through congress a comprehensive national educational reform addressing many of the movement's requests.

Taking advantage of the window of opportunity that Bachelet's pro-women rights government opened, feminist organizations used recent massive rallies over gender violence to insist on their demands against Chile's abortion ban. As a result, a bill legalizing abortion in some cases passed congress this year and will soon be implemented. Similarly, after several years of mobilizing and lobbying, the LGBT movement built awareness on gender identity rights among politicians and the general public. Only a few months ago, the senate began discussing a revised gender identity bill, initially drafted by civil society organizations, which will recognize transgender people and will regulate gender reassignments. In July 2016, massive protests across the country demanded reforming the highly privatized national pension system. The movement stressed the deep crisis of the pension system and sought to exclude private companies from managing people's funds. The government reacted by introducing a bill to congress meant to create a new mixed system that will address several of the movement's demands. Although some more successfully than others, most movements have been making strides in defining Chile's political agenda.

Somma and Medel (2017, pp. 48–50), in fact, identify four features shaping Chilean movements' public approval, thus defining their ability to pursue policy change despite their distance from political institutions. They found that politicians associate the *massiveness of protests* with higher levels of popular discontent. Supporting protesters in those cases, hence, is seen as electorally profitable. Movements are also more effective

when their protests are more *publicly visible*. When they occur in cities, for example, demonstrations are more likely to be covered by the mass media, thus reaching a considerably larger audience. In these cases, police violence tends to erode the legitimacy of authorities in the eyes of the general public. Also, the Chilean government has shown to prefer negotiating or accepting movements' demands when they carry out disruptive protests in public, visible places – e.g., blocking streets or occupying central state buildings. Conversely, when disruptive mobilization occurs in more isolated and less visible areas, authorities tend to quickly oppress and deactivate those initiatives. Finally, less violent protests tend to face less repression and obtain more government concessions than violent ones.

## Conclusion

This chapter provided an overview of how politicization and mobilization has developed in recent Chile. A historical perspective shows that civil society development in Chile has not been linear. Social mobilization grew highly politicized and in direct connection with political parties throughout most of the twentieth century. People endured protest even during Pinochet's highly repressive military dictatorship. The transition after democratic restoration in 1990 saw the deactivation of social movements and the de-politicization of Chilean society. Disaffection and distrust toward political institutions increased steadily throughout the 1990s.

Unlike in most other countries in Latin America, the reactivation of mobilization in the early 2000s involved a progressive detachment from political institutions – especially political parties. This is particularly noticeable in the case of the student protests of 2011. Research has shown that this distance from political parties provides movements with credibility and effectiveness in building policy change.

In recent years, several student leaders have entered the Chilean political establishment pushing forward progressive legislation as congress members. Arguably, by using the popularity provided by the movement's momentum, these leaders expanded its impact in the political arena. Now, associated in a coalition of several movements and small parties, these leaders have sought to increase their representation by bringing more, highly competitive young candidates to the next congressional and presidential elections. The success of this movement's institutionalization in keeping a direct connection with the civil society's agenda in the future is to be seen.

# Politicization of Bureaucracy

Daniel Appiah and Abdul-Gafaru Abdulai
Department of Public Administration, University of Ghana Business School, Accra, Ghana

## Synonyms

Bureaucracy; Democracy; Politicization; Public administration

## Definition

Bureaucracy: Bureaucracy refers to a formal-legal organization with a hierarchical structure of authority whereby merit-based criteria are used to appoint, retain, promote, and reward or sanction officials who perform functionally specialized duties in an impersonal manner.
Politicization: Politicization of bureaucracy is broadly defined as the substitution of impersonality for personal criteria in the functioning of the bureaucracy.
Democracy: Democracy is the institutional arrangement whereby individuals or groups of individuals in a society participate in regular free elections for the people's vote to acquire the power to decide on constitutional opportunities on the strength of their advocated policies and/or their projected images.

## Introduction

Public bureaucracies are institutions of administration that privilege some values, actions, interests, and actors in the distribution of resources to members of society. Governments create public bureaucracies as a means to distributing resources. Public bureaucracies are key arenas of power struggles in society because they are central instruments used by government for distributing resources. Individuals and interest groups seek to gain access to, and control of, public bureaucracies. Paradoxically, since the middle of the nineteenth century, there have been numerous public sector reforms in countries to create public bureaucracies that perform their mandates autonomously from the control of interest groups in society, particularly government. Such reforms have taken their inspiration from Max Weber's theory of an ideal-type bureaucracy where impersonal administration is used to attain the highest degree of rationality, reliability, and efficiency in the production and use of resources in society (Weber 1968). From Weber's theory of bureaucracy emerged the politics and administration dichotomy model where attempts by government and other political groups to influence impersonal

administration by bureaucrats are considered anathema to the quest for efficiency and effectiveness. Everywhere, there have been claims and criticisms that public bureaucracies have become more politicized.

Since the inception of public administration as a discipline of study, the study of public bureaucracies has continued to receive a lot of research attention. The politicization of bureaucracy by governments, whatever this means, is a hotly contested issue, both conceptually and empirically. There are numerous questions around the notion of politicization of bureaucracy, including the following: What is an ideal bureaucracy? What is meant by the notion of politicization of bureaucracy? Under what conditions can an impersonal system of administration emerge in any country where diverse political actors are continuously engaged in a power struggle over resource distribution? Is it feasible, and whose responsibility is it anyway, to create a public bureaucracy that is autonomous from the control of the government? Can a bureaucracy that is independent from political manipulation by interest groups be responsive to the development policies of the government? Are the institutions of bureaucracy and democracy contradictory or complementary? What should be the relationship between the political executive and public service bureaucrats in a democracy to promote efficient, effective, and stable development? This chapter tries to briefly take stock of some of the answers provided by scholars to these questions.

## What Is Bureaucracy?

The concept of bureaucracy is usually used in two main ways in much of the literature on public administration. The first meaning is Max Weber's ideal-type concept of bureaucracy defined as a formal-legal organization with a hierarchical structure of authority in which merit-based criteria are used to appoint, retain, promote, and reward or sanction officials who perform functionally specialized duties in an impersonal manner. According to Weber (1968: 959), the core value of impersonality in the performance of jurisdictional functions can only be attained if three conditions are met: first, that the official is servant to some ideological "other-worldly sacred values" of functional purposes embodied by members of the society, rather than establish a relationship of loyalty to a particular person; second, that the official "always strives for and usually attains a distinctly elevated social esteem vis-à-vis the governed"; and third, that the official and the system of rank order are given legal protection in the impartial performance of official duties. Weberian bureaucracy requires expert training, rule of law, and supportive cultural values for its effective functioning. Weber's ideal-type bureaucracy is the dominant understanding of bureaucracy found in academic textbooks, scholarly publications, and civil service reform programs.

The modern state has not evolved from contending political struggles between powerful actors to function like what Weber refers to as a "monocratic bureaucracy." In Weber's words, a monocratic bureaucracy is the one that is "capable of attaining the highest degree of efficiency, and is in this sense formally the most rational known means of exercising authority over human beings. It is superior to any other form in precision, in stability, in the stringency of its discipline, and in its reliability" (Weber 1968: 223). Such forms of bureaucracies are extremely rare because countries across the globe are generally characterized by "a combination of merit and patronage, near specialization, and some degree of rules are applied in the real world of public administration and governance worldwide" (Farazmand 2010: 246). Consequently, a group of scholars have developed a "realist" meaning of the concept of bureaucracy. This perspective defines bureaucracy "as a hierarchical organization of officials appointed to carry out certain public objectives. The extent to which such an organization does or does not fit Weber's model (for instance with regard to the appointment and promotion of officials by objective criteria and the general, objective, impersonal rules guiding their actions) can thus be left open for empirical investigation" (Etzioni-Halevy 1983: 5). The Weberian ideal type of bureaucracy offers the analytical lens for

scholars to examine the extent of politicization of the bureaucracy created by governments in modern states. While some states are better organized along the Weberian bureaucracy, others are heavily organized along clientelistic and patronage norms. Some scholars have argued that states that are better organized along Weberian lines are more capable of promoting development (e.g., Acemoglu and Robinson 2012).

Historically, all states (including the ancient Assyrian, Median, Persian, Ottoman, and Chinese Empires) have been organized according to a hierarchy of officials appointed to carry out certain public objectives. Farazmand (1997: 49) observed that "Although the Egyptian and Chinese bureaucracies were very much controlled by the monarch, their systems developed a tendency toward professionalization through functional specialization and structural differentiation based on some education, training, and, in the case of the Chinese, some form of merit entrance examination for the civil service system. The Assyrian empire was a bureaucratic empire with maximum rigidity and inflexibility." The French, Prussian, and British empires that inherited the practice of bureaucracy improved the system to its modern standards and practices of universal merit-based recruitment of the "common man," rule-of-law-based impersonality, and functional professionalization in civil service systems. In Britain, the organization of a Weberian professional civil service took off after the publication of the Northcote-Trevelyan Committee Report in 1854. The USA followed in the footsteps of its former colonial master by passing in 1883 the Civil Service Reform Act (the Pendleton Act) to set the foundation for a long contentious process of building a professional civil service out of the entrenched spoils system (Grindle 2012). Woodrow Wilson, who became the 28th President of America, had argued in his famous seminal article "The Study of Administration" (1887) that there was the need to rescue the administration of government policies from "the hurry and strife of politics." Developing countries inherited their modern public bureaucracies from the Western European colonial rulers. Some scholars have argued that "the character, behavior, culture, structure, and values" of modern public bureaucracies in developing countries "reflect Western influence" (Farazmand 2010: 250); however, other scholars, extending Max Weber's concept of "patrimonialism," have characterized these public bureaucracies (particularly in African states) as neopatrimonial structures that reflect both Weberian rational-legal rules and patron-client power relations of power (Erdmann and Engel 2007).

Scholars are yet to secure agreement on the extent to which government can exercise some political influence over its own bureaucracy. In ancient and modern states, bureaucratic administration has never been fully autonomous from the control of their governments who used it as an instrument of domination and policy implementation. Public sector reforms intended to separate bureaucratic administration from the political control of government always met strong resistance from government officials. Reducing the political influence of governments in bureaucratic organization and administration, in the hope of making the bureaucracy more efficient and effective, has attracted scholarly attention. While there is general agreement among scholars that all governments have politicized their civil service bureaucracies to some extent, there exist different conceptions of what is meant by the politicization of bureaucracy in the literature.

## What Is Politicization of Bureaucracy?

There are various definitions of what is meant by the politicization of bureaucracy. To clarify what is meant by "politicization of bureaucracy," it is important to first define the concept of "politics." In the broadest sense, politics refers to the process whereby power is contested for, obtained, and exercised. Politics is therefore found in all human organizations including the bureaucracy. Due to conflicts of values over questions on who gets what, when, and how, the process of contestation for the acquisition, maintenance, and use of power never ends even when the majority reaches consensus. Weber (1968) observed that "Bureaucracy has been and is a power instrument of the first order – for the one who controls the

bureaucratic apparatus." Different actors in society therefore try to gain access into the bureaucracy to influence the decisions and behavior of bureaucrats in the allocation of resources. Government, political parties, nongovernmental organizations (both local and international), ordinary citizens, and even officials in the bureaucracy are all involved in the game of politics in order to control the distribution of resources.

There have been differences of scholarly opinion as to whether a truly independent, apolitical, and nonpartisan professional bureaucracy can be created in any country for the impersonal performance of functions concerned with resource distribution. This has implications for the definition of what constitutes the politicization of bureaucracy. What has famously become known as the politics-administration dichotomy debate has continued to generate strong debates among scholars and practitioners of public administration. Woodrow Wilson (1887) argued that "Administration lies outside the proper sphere of politics. Administrative questions are not political questions. Although politics sets the tasks for administration, it should not be suffered to manipulate its offices." Wilson used the concept of politics in its narrow sense of referring to the political process of public policy-making by government for the allocation of resources.

Do the losers in the public policy-making process go home to sleep quietly and allow administrators in the state bureaucracy to impersonally implement the laws and policies in the distribution of resources to the winners? The Wilson orthodoxy of politics-administration dichotomy was the dominant intellectual perspective that drove public administration reforms in the USA until the mid-1940s when it was shattered by other scholars (Waldo 1948). Critics mounted the powerful argument that a public bureaucracy is inherently a political creation of government to implement its policies; bureaucratic officials participate in the process of policy-making by providing information and expert advice to government, and, ultimately, policy administration is only a part of the continuous political process of resource allocation in society. Politics is a process which does not stop with the crystallization of the preferences of contending actors into legal rules and public policies for implementation.

Decades after discrediting the Wilsonian orthodoxy, Waldo (1971: 264) recognized that a generation after discrediting of the notion of "politics-administration" dichotomy, "we have made little progress in developing a 'formula' to replace it." Even though the Wilsonian orthodoxy of politics-administration dichotomy is dysfunctional to theory building and the practice of public administration, it still serves a useful purpose for politicians, administrators, and reformers in their continuous struggle over effort to reduce government political control over the civil service administration. Governments seek to control the implementation of public policy by civil service bureaucrats, but the latter also require some degree of independence for its core Weberian value of impersonality in the delivery of public service to all citizens.

Politicization of the civil service has often been discussed in the literature through the lens of Weber's ideal type of bureaucracy, but scholars have applied the concept to different aspects of the bureaucracy. The politicization of bureaucracy has often been defined to mean the substitution of merit-based criteria in the recruitment of public sector employees for political criteria of loyalty to a political party or political leaders (Peters and Pierre 2004). Many of the definitions of politicization are targeted at the basic level of personnel recruitment and performance management issues of promotion, retention, rewards, and disciplining of members of the civil service.

The criteria of merit-based recruitment of bureaucratic employees have been the most common issue discussed in the literature on politicization of the bureaucracy. It has been noted that the focus on employee recruitment may have received greater attention due to the general assumption that establishing a relationship of personal loyalty with bureaucratic employees is the best launchpad to gain access to vital bureaucratic information and influence decisions concerning the allocation of resources. Peters and Pierre (2004: 6) have noted that "politicians may politicize the public service in order to change policy"; it is also possible for the politicization of policy to

occur even in contexts where public service appointments are not politicized (Eichbaum and Shaw 2008: 342). Similarly, politicizing the recruitment of employees may not achieve the objective of changing policy if the new recruits are captured by the organizations they were meant to influence. Definitions of politicization of the civil service bureaucracy that focus on the basic level of human resource management have therefore been criticized by other scholars as too narrow. This has led to suggest the need to "distinguish between the politicization of *appointments* and the politicization of *policy*" (Eichbaum and Shaw 2008: 341, italics from source).

It may be helpful to conceive of politicization of the bureaucracy as an intervention that violates the Weberian core value of impersonality. Therefore, using the Weberian core value of impersonality, politicization of the bureaucracy may be broadly defined as the substitution of impersonality for personal criteria in the functioning of the bureaucracy. Specifically, politicization of the civil service bureaucracy can be broken down into the substitution of merit-based criteria for personal criteria in the recruitment, retention, promotion, rewards, and disciplining of members of the civil service; the substitution of neutral competence for personal criteria in the delivery of civil service mandates; and the substitution of civil service mandates for personal functional purposes. Kaufman (1956: 1060) defined "neutral competence" of bureaucrats as the "ability to do the work of government expertly and to do it according to explicit, objective standards rather than to personal or party or other obligations and loyalties." The concept of "neutral competence" is implied in the Weberian core value of impersonality of bureaucrats in the performance of specialized functions. Other scholars have argued that when the mandate of a civil service organization is substituted for personal functional purposes, or the mandate is taken away and given to a new organization created by the government to achieve political objectives, a process of "structural politicization" has occurred.

Beyond the analysis of politicization of employees of the civil service bureaucracy, empirical analysis of the politicization of policy-making is usually complex because of difficulties in the empirical measurement of concepts associated with these. Peters (1997: 235–236) uses the following five ideal models to conceptualize the relationships between administrative civil servants and political executives in the policy-making process:

- The "Weberian/Wilsonian" model where there is the almost complete separation of politics and administration, with civil servants willingly taking the direction of their nominal political "masters".
- The "administrative state" model where there is the same separation between politics and administration but with the bureaucracy being the dominant force.
- The "adversarial model" where there is a substantial separation between politicians and civil servants but also that there is no clear resolution in their struggle for power.
- The "village life" model where civil servants and politicians are both parts of a unified state elite, and that they therefore should not be considered as being in conflict over power or policy.
- The "functional village life" model which assumes some of the same integration of civil servants and politicians but within specific functional areas of government.

The Weberian/Wilsonian model is the ideal type which cannot exist in any country. However, the factors that influence the emergence of each of the non-Weberian models in countries have not been extensively examined in the literature. Contrary to popular practice in comparative political analysis, Peters (1997: 250) remarked that the use of any simple division between presidential and parliamentary systems does not appear to be valuable in making predictions about the relationship between the political executives and the civil service bureaucracy. Peters (1997: 250) identified two factors that appear particularly relevant for understanding the relationship between civil servants and ministers. One is the politico-administrative culture of the country as it relates to the role of

civil servants and their separation from partisan political life. The second is the "recruitment patterns" of both civil servants and ministers from either a specialist training background or from a generalist background. There has been little empirical research to uncover how the above two factors shape the relationship between the civil service bureaucracy and the political executive. It is important for scholars of public administration to examine the factors that shape the emergence of the four non-Weberian/Wilsonian models, the relative effect of the models on policy-making, and the outcomes on processes of social, economic, and political development.

## The Relationship Between Democracy and Bureaucracy

The analysis of the politicization of bureaucracy has led to an increasing scholarly focus on the relationship between democracy and bureaucracy. Democracy is the institutional arrangement whereby individuals or groups of individuals in a society participate in regular free elections for the people's vote to acquire the power to decide on constitutional opportunities on the strength of their advocated policies and/or their projected images (Lipset 1959; Etzioni-Halevy 1983). A number of scholars have examined the important question of whether democracy undermines or supports bureaucracy and whether democracy and bureaucracy are contradictory or complementary. Weber (1968: 957) was emphatic that there is "the basic contradiction" between the ideal type of monocratic bureaucracy and popular electoral democracy. According to him, "Popular election not only of the administrative chief but also of his subordinate officials usually endangers, at least in very large bodies which are difficult to supervise, the expert qualification of the officials as well as the precise functioning of the bureaucratic mechanism, besides weakening the dependence of the officials upon the hierarchy" (Weber 1968: 961). Many analysts see a political dilemma between popular demands by voters and politicians for a responsive democracy, on the one hand, and the requirement for a professional bureaucracy to support policy-making and implementation by whichever government is elected into power.

What then should be the relationship between democracy and the civil service bureaucracy? Many scholars would support the view that "It is a hypocrisy to speak of democracy without bureaucracy, because both are well integrated, and one without the other does not work" (Farazmand 2010: 255). As earlier pointed out, Weber argued that one of the important conditions for the attainment of the core value of impersonality in a bureaucracy is a system of rule of law that protects bureaucrats in the performance of official duties. Scholars have recognized that democracy provides an environment of political and civil liberties required to support meritocratic recruitment of the common man into the civil service bureaucracy. Bureaucracy, on the other hand, strengthens the democratic value of equality through the impersonal delivery of service to all citizens who qualify to receive benefits from the implementation of public policies, regardless of party allegiance. Although elected governments may have constitutional opportunities to reform the civil service bureaucracy, it is also the case that bureaucratic impersonality in public service delivery will not be achieved if the elected politicians and their appointees substitute bureaucratic impersonality in decision-making for personal and partisan criteria. Indeed, the relationship between democracy and bureaucracy is both paradoxical and complementary as recognized by many analysts (Etzioni-Halevy 1983; Farazmand 2010; Peters 2010).

Many scholars are of the opinion that the incentives for elected governments and other actors to politicize the civil service bureaucracy will be reduced if the bureaucracy is democratized through two main approaches: first, ensuring that there is "social representation" of diverse groups and genders during the recruitment of employees, and, second, ensuring that there is "policy representation" of ideas from diverse professional experts during policy decision-making (Rourke 1997). Social representation and policy representation will serve as the "inner check" in the civil service bureaucracy to reduce the incentive for governments and their appointed bureaucratic

heads to pursue politicization. It is commonly accepted that promoting representative bureaucracy "is an important step in democratizing the bureaucracy" (Farazmand 2010: 206). Democracy and bureaucracy are more likely to be more complementary than contradictory if the democratic value of representation in decision-making is extended into bureaucracy. Democratizing the bureaucracy is now being advocated in the literature as the best guarantee against politicization.

## Conclusion

Bureaucratic administration by civil servants in developing and developed countries is targeted by both the winners and losers in the politics of resource distribution in society. In spite of increasing criticism by scholars against the politicization of the civil service bureaucracy by governments in all countries, the literature offers no definite conceptual boundary of how far governments should relate to the civil service bureaucracy in the pursuit of developmental goals. Using the Weberian lens of bureaucracy, conceptual definitions of the politicization of bureaucracy found in the literature include the substitution of merit-based criteria for personal criteria in the recruitment, retention, promotion, rewards, and disciplining of members of the civil service, the substitution of neutral competence for personal criteria in the delivery of civil service mandates, and the substitution of civil service mandates for personal functional purposes. Following the ascendency of the modern democratic state, scholars and practitioners of public administration have revived the quest to create a professionally competent civil service bureaucracy that is free from government political interference. Many scholars are now advocating the creation of a democratically representative bureaucracy – through the representation of diverse social groups during employee recruitment, as well as the representation of diverse ideas from different professionals during policy-making – as the best strategy to counter the tide of politicization. The values of responsiveness, equality, and representation are now being used by scholars to strengthen the complementarity of democracy and bureaucracy. How to ensure that political and bureaucratic elites will respect such values in their respective camps is the key challenge to which public administration scholars must provide theoretical and practical solutions.

# Politicization of Iran's Public Administration Based on Institutional Perspective

Tayebe Amirkhani
Department of Public Administration, Faculty of Management and Accounting, Shahid Beheshti University, Tehran, Iran

## Synonyms

Criteria for appointment and promotion in the office: professional competence or political loyalty; Dominance of politics over administration; Politics-administration dichotomy

## Definition

Politicization is illustrated from different perspectives. From one perspective, politicization is considered as the extent to which politicians control bureaucratic careers. Thus, a politicized bureaucracy is a bureaucracy whose employees are hired, promoted, or fired based on political principles which run counter to professional skills and competencies. From another perspective, politicization of bureaucracy happens also when the institutions and organizations of the bureaucracy and government are highly guided by political, revolutionary, ideological, or national goals or strategies that are aimed at promoting certain values or defending against adversarial and counterrevolutionary ideas or foreign infiltrators.

## Introduction

The relation between politics and administration has always been of interest to politicians and public administration scientists.

Governmental organizations are never thoroughly separate from other parts of the political system because they are part of the chain of delegations, from voters to elected officials, departments, and other public sector organizations (Batch 2018).

Since the democratic government relies on its administration for performing policies and formulating new policies, this dependence has led to the question of how the relation between senior political managers and public sector staff should be organized. In this regard, the discussion of the required competencies alters the balance for the decent administrative system, while the issue of the political accountability of the administrative system changes the balance for the politicized bureaucracy so that appointments are based on political criteria instead of professional competence (Christensen et al. 2014).

This caused public administration reforms, which began in the 1980s and 1990s, and had a dual purpose for relieving a high level of civil service from politicization and granting more managerial independence to public managers (Walle 2019).

Thus, the issue of politicization of the administrative system has always been considered by scientists in the field of public administration and political sciences. This issue becomes more important when it arises in developing countries because the administrative system in its current form is usually formed in the imitation of the West in some of these countries. On the other hand, the emerging democracies in the political system of these countries do not have

many of the features of Western democracies. Therefore, the balance between the political system and the administrative system is disturbed for one side.

Today, Iran is also one of the countries which are facing the problem of politicization in its administrative system. The importance of studying the Iranian administrative system is related to the fact that Iran has an important historical place in the world civilization and a unique geographical location in the Middle East, while experiencing important developments such as two revolutions in the contemporary era (Farazmand 2002). Considering the problems of the Iranian administrative system can be seen in many developing countries which have similar conditions to Iran, rooting these problems can be very important. Thus, the problem of politicization of the Iranian administrative system from an institutional perspective is analyzed and rooted in this article. Thus, the theoretical basis of the analysis is presented in the first section.

## Theoretical Foundation

### Politicization

The concept of politicization widely refers to the functioning of modern bureaucracies (Ohberg et al. 2016). Bureaucracy – both civilian and military – is the institutional arm or machine of the government that implements programs and policies, leading to the achievement of political goals. Accordingly, the main question is raised regarding who the bureaucracy serves, who controls it, and how it acts as a process (Farazmand 2018); thus, there has been a long-standing conflict between politicians and bureaucrats. According to Panday (2018), the effect of politicization reflects an important dynamic relationship between politics and governance. From Panday's point of view (2018), politicization is illustrated through two broad perspectives. The first category regards politicization as the participation of the bureaucracy in the policy-making process. However, the second category concerns the effect of politicization on appointments in the bureaucracy.

In another classification of types of politicization, Cooper (2015) explains that politicization is used with two different meanings. The first meaning is concentrating on the behavior of public sector employees, especially their tendency and capacity to provide loyal and competent services. The second use of this word focuses on the standards by which personnel are assigned to administrative positions. In fact, in many countries, the appointment of high-ranking officials is an important source of power for the head of government, which requires much attention. Boräng et al. (2018) define politicization as the extent to which politicians control bureaucratic careers. Thus, a politicized bureaucracy is a bureaucracy whose employees are hired, promoted, or fired based on political principles which run counter to professional skills and competencies. Therefore, politicization occurs when political criteria replace criteria based on competence in selecting, retaining, promoting, rewarding, or punishing members of the administrative system (Ohberg et al. 2016). Here, this definition of politicization is the basis of the analysis, which is also referred to by Peters and Pierre (2004).

In democracies, important changes in the result of elections lead to major changes in appointments aimed at ensuring that bureaucratic priorities are in line with the preferences of elected authorities. This political control aims to ensure the accountability of the bureaucracy because the elected officials are the legitimate representatives of the citizens and have a legal responsibility to recognize and pursue their interests. Therefore, the elected officials have to provide political guidance to bureaucrats to ensure that bureaucracy and democratic governance are compatible (Liao 2018).

Although political control may improve bureaucratic accountability, it can have devastating effects (Bersch et al. 2016). This keeps the bureaucracy away from the principles of independence, permanence, and meritocracy of the bureaucracy and re-enters politics into the realm of administration. Thus, politicization can be a threat to the financial security and professional identity of public sector employees (Cooper 2015).

Bureaucratic politicization has some interrelated signs which affect democracy including corruption, customer-centric electoral competition, and the inability to identify valid electoral foundations for public goods and the proper supply of public goods (Boräng et al. 2018). Therefore, rooting the politicization of the administrative system should be highlighted.

## Institutionalism

As Douglas North (2005) states, institutions are the rules of the game in a society or the bonds imposed by mankind that shape human interactions with one another. As a result, institutions organize the hidden motivations in human exchanges, whether these exchanges are political, economic, or social. Institutional changes specify the evolution of human societies throughout history; hence, they are the key to understanding historical changes. According to Douglas North (2005), institutions can be formal or informal, which means that institutions can both be created as the constitutions of countries and can be formed and transformed slowly such as common law.

Regarding the role of institutional arrangements, Panday (2018) emphasizes their primary effects on the behavior of public officials through formal and informal rules. Besides, these institutional arrangements also affect the administrative operations and policy-making of governments. Hence, it can be argued that institutions contribute significantly to shaping and defining the relationship between politicians and bureaucrats.

In this regard, Williamson (2000) introduces four levels of social analysis for studying in the context of neo-institutional economy.

The top level is the social embeddedness level, where the norms, customs, mores, traditions, etc. are located. Religion plays a large role at this level. Level 1 is taken as given by most institutional economists. Institutions at this level change very slowly (p. 596).

In this regard, Williamson (2000) believes that identifying and describing the mechanisms by which informal institutions are created and maintained helps us understand the slow process of change at Level 1 of institutions.

The second level refers to the institutional environment. The structures observed at this level are partly the product of evolutionary processes. However, design opportunities are also posed.

Going beyond informal Level 1 restrictions (sanctions, taboos, customs, traditions, and codes of conduct), formal rules are included at this level, which include constitution, laws, and property rights.

This opens up the opportunity for first-order economizing, i.e., getting the formal rules of the game right. Constrained by the shadow of the past, the design instruments at Level 2 include the executive, legislative, judicial, and bureaucratic functions of government, as well as the distribution of powers across different levels of government (federalism). The definition and enforcement of property rights and of contract laws are important features (p. 598).

The third level is the level at which governing institutions are located. In other words, the set of regulations and circulars which are set to guarantee the implementation of the rules of the game is located at this level. The fourth level is the level of resource allocation and employment (Williamson 2000). In Williamson's viewpoint, any change in development requires the adaptation of Level 1 institutions. Of course, it is possible that the rules of the game are not proper to the culture and customs due to the existence of authoritarian regimes, and it is possible to change the rules of the game through a general alteration such as revolution. These kinds of changes cannot be considered as the rule but an exception. The opposite happens when the rules of the game are more progressive than the Level 1 institutions brought from outside the borders. In this case, the implementation of these rules is problematic due to the discordancy of these rules with the culture of the people. However, it is expected that the culture of the society will change gradually if their implementation is assured. It means that the velocity intensified the changes at Level 1 by the beginning of the evolution at Level 2 (Williamson 2000).

Based on the abovementioned issues, it can be concluded that the evolution of institutions should

be studied over time from an institutional perspective because institutions depend on the path, and what we see in the current situation is a function of the historical trend which has occurred over the years (North 2005).

## Rooting the Causes of the Politicization of the Iranian Administrative System

Although Iran had one of the oldest and richest traditions of public administration in ancient times in the world, the Iranian administrative system began to decay during the eighteenth and nineteenth centuries (Farazmand 2001). Today, Iran, despite its brilliant history of governance, culture, and administrative achievements, has lagged behind in the process of improvement towards higher levels of governance and public administration. Chaos, change, and political and revolutionary disturbances, along with foreign interventions are considered as some features of the administrative and political system of modern Iran (Farazmand 2002). Thus, public administration in modern Iran is the product of an old endogenous tradition (indigenous ancient tradition) and new concepts of organization and administration which are taken from the Western world (Farazmand 2001). As Saboori (2001) states, based on historical researches, there was an extensive administrative organization in the imperial governments of ancient Iran. Iranian society was mainly agricultural, and its main production was agriculture and animal husbandry. In Iran, like in the other great empires of the ancient world, the government had a religious and political aspect, and it is clear that power in the bureaucracy in this system is in the authority of those who are close to the main center of power, the king. Since land possession was the basis of power, both in ancient Iran and after, high administrative positions were in the authority of nobles and large owners for a very long period in the history of Iran which continued until the end of the Qajar era and the establishment of the modern state. The Qajar era should be called the period of transition from the traditional tribal political system and bureaucracy to the monarchy and modern bureaucracy. In this era, due to the relationship with the West and the movement of Iranian intellectuals, changes took place in the Iranian administrative system. The first steps for establishing a modern government during the Qajar period were taken by Mirza Hussain Khan Sepahsalar. In this way, he created nine ministries and a great presidency based on Western style. However, since the preconditions for establishing a modern administrative organization did not exist, some of the traditional structures which had long existed in the court became official bureaucratic structures, and high-ranking officials were elected from the members of the royal family and the court. Moreover, the employees of departments and ministries at that time did not spare any means and title to achieve their personal goals, and most of the employments were done without considering special expertise and criteria. Thus, the new administrative structure was mixed with traditionalism (Saboori 2001).

The changes that occurred in Iranian society in the first two decades of the twentieth century provided the way for establishing a modern state bureaucracy (during the reign of Reza Shah Pahlavi). During this period, a new government bureaucracy emerged in terms of staff, goals, departments, and activities. In this period, one of the important features of the development process was that the bureaucracy, army, and administrative organization were the mainstay of the government. In this era, for the first time, the features of the rational-legal bureaucratic structure can be seen in the government bureaucracy, which was completely different from the bureaucracy of the previous periods from Safavie to Qajar. However, one of the special features of the bureaucracy of this period was that the traditional and modern elements were intertwined, which was reflected in its administrative behaviors. Another important point was that the influence of the political system and the power of the monarchy on the bureaucracy, in the absence of real parliamentary oversight, caused the bureaucracy to react essentially to pressure from above and the wishes of superiors. In addition, the government bureaucracy achieved a lot of power during this period and became a special sector or subculture and a

group with high social prestige in society. In order to protect their benefits, the influential groups tried to establish a close relationship with the bureaucracy and, if possible, to include a family member or relative in high bureaucratic positions. These features made bureaucratic agents consider themselves government servants and had a kind of patriarchal attitude towards the people. During the reign of Mohammad Reza Pahlavi, the Iranian administrative system witnessed a huge increase in bureaucratic staff, rising costs and budget of government bureaucracy, and the development of government administrative organizations. In this period, the blending of traditional and modern elements continued, and the negative impact of political factors is another feature of the bureaucracy in this period, which, like the previous period, is related to the political system. For example, despite the enactment of numerous laws on attraction, recruitment, and holding recruitment tests for entry into the bureaucracy, political officials easily violated the set rules if they wanted a person to enter or not. Further, high positions in the administrative system were held by people who were approved or supported by political officials.

It is worth noting that the bureaucracy was considered as a major tool for social change and political socialization, for example, its role in the performance of programs known as the White Revolution, which has expanded the scope of bureaucrats' activities beyond their specific goals and affected the social life of large groups of the population (Saboori 2001).

Today, according to the report of the Research Center of the Islamic Consultative Assembly (2013), the biggest and most important issue in the administrative organizations is extreme politicization. As Danaee Fard (2016) mentioned, currently in Iran, election campaigns determine who should be the manager in public administration. Hence, the main goal is to seek a share, not to control the bureaucracy, and even in the most specialized bureaucracies, the goal is to create a foothold for party members. On this basis, there is always a kind of revolutionary atmosphere in the government organizations, and every manager takes revenge with the victory of his party. This trend has more or less existed since the beginning of the victory of the Islamic Revolution and has intensified in the last decade. This challenge will exist in the future due to the nature of the country's political system.

Analyzing the current politicization of the Iranian administrative system from the perspective of institutionalism, we can say that at the first level of institutional analysis according to Williamson (2000), norms, traditions, and customs have been formed throughout history in Iran which create or improve these conditions. In other words, the culture of a country and particularly politico-bureaucratic culture play an important role. The politico-bureaucratic culture refers to the dominant norms and values that affect the attitudes, interpersonal relationships, behavior, and performance of bureaucrats and politicians during governance and development (Rahman 2018). Considering the politico-bureaucratic culture in Iran, it is noteworthy that since the formation of the modern administrative system in the Qajar period, this system has been a tool in the hands of the monarchy, and in the absence of any laws and regulations, the king and the monarchy have been allowed to interfere or grab in the administrative system. In the absence of any rules for recruitment or promotion, only the king's relatives and trustees held positions so that sometimes the minister of several ministries was one person. Thus, the occasions of the Qajar dynasty court in the administrative system were reproduced.

During the Pahlavi era, when codified laws were gradually adopted, the history of tyranny in the monarchy, the weakness and infancy of the rule of law in Iran, and the process of government-centered development of the Pahlavi government led to the high domination of the monarchy over the administrative system. Thus, the administrative system has not been recognized as an independent institution.

In the context of dictatorship-based culture, the increase in oil revenues steers government towards rentier government, and this in turn reinforces authoritarianism in the government. The important point in this regard is forgetting the criteria of efficiency, effectiveness, and economy

in all areas of management in general and in the administrative system in particular, which, in turn, deprives attention to expertise and competency-based criteria in the administrative system.

The dominance of politicians over the administration, ignoring the efficiency and effectiveness, and using the administration for political and personal purposes and consequently ignoring meritocracy have created an intense atmosphere of politicization so that the competency-based criteria for selection and appointment of government employees are forgotten and loyalty to the criteria defined by politicians is the main principle for selection and promotion in Iranian administrative system.

Regarding the second level of institutions, from Williamson's point of view (2000), which includes approved laws and regulations till now, three national employment laws were passed in 1931, 1966, and 2007. However, none of these laws, which were approved in the three periods of the first Pahlavi, the second Pahlavi, and the Islamic Republic, have been able to prevent the politicization of the administrative system. According to the institutionalist view, one of the most important problems is the huge gap between the goals, rules, and performance achieved in society. Thus, the experience of Iran in the last hundred years shows that most official laws are based on the laws of developed countries but it has not been successful in action because it has not been commensurate with informal institutions. In other words, the legislators were unaware of the key point that these new laws are not institutionalized in society and are not compatible with customs, values, customs, and traditions, and institutionalization processes must also be predicted for adapting the existing informal institutions on these formal institutions. These kinds of laws are the same as Williamson's black letters, which are not enforceable, while a good law is a law which all the necessary guarantees for its operation are predicted based on the bottlenecks in the text of the law in Williamson's view. In other words, in order to successfully perform the enacted laws, it is necessary to predict the institutionalization processes as well; otherwise, the mere assumption of progressive laws without attention to the necessary cultural contexts to implement them cannot achieve the essential results. Thus, these laws have not been able to achieve the expected results, and despite the fact that more than a hundred years have passed since the formation of the modern administrative system in Iran, its content is still far from the rationality which hides in the nature of bureaucracy.

## Conclusion

Development is a set of institutional improvements. According to Williamson's theory of four social levels, these institutional transformations are staged. Therefore, we must start with the reform of institutions at Levels 1 to 3 in order to make reforms. Planning to reform must also consider the importance of communication between each level. However, it should be noted that bottom-up communication (from Level 1 to Levels 2 and 3) is stronger than top-down communication. In other words, norms, customs, and beliefs at the first level determine the rules at the second level, while the influence of laws modeled on other cultures on domestic customs and traditions is much less. Of course, according to Williamson's arguments, the degree of top-down influence (the influence of Level 2 and Level 3 institutions on Level 1) depends on the cultural conditions of different countries. The more dynamic the cultures and the more willing they are to change, the greater the impact is expected. According to Williamson's perspective, in order to reform and adapt institutions to the development process, we need long-term planning and step-by-step reforms, not revolutionary and short-term reforms. Thus, during the last century, the development process in Iran in general and the development of the administrative system in particular, under the influence of modernization in the West, has always followed a top-down pattern; in this regard, Vigoda-Gadot (2018) points out that false top-down initiatives are specific to non-democratic regimes. Nevertheless, the right top-down changes occur in liberal environments and prosperous societies where there is mutual understanding along with the acceptance of the needs

and desires of others. In such a context, there is also respect for free markets and exchange mechanisms between people. There are counterproductive top-down initiatives in the field of public policy-making in environments that lack this acceptance, and consequently, the bottom-up initiatives are empowered.

In the institutional context of Iran due to the nondemocratic nature of regimes supporting top-down initiatives and the lack of attention to free markets and mechanisms of free exchange among individuals, development has been limited to the imitation of Western civilization (structures, laws, and other artifacts), and what is known as the cultural aspect of this development (fundamental assumptions, values, and norms) has been neglected. This, in turn, has led to the development process in Iran being limited in form and appearance, and the institutions created in imitation of the West are not functioning properly since the intellectual foundation required for the proper functioning of these institutions has not been formed in Iran at the level of values or fundamental assumptions. This chaos has intensified in recent times because the current government of Iran (Islamic Republic) in stark contrast to the Pahlavi government, which was the founder of many of these structures and institutions, openly opposes the ideological foundations of Western modernization, but has not succeeded in theorizing or creating a structure based on Islamic intellectual principles to run the affairs of the country. This, in turn, has made the process of institutionalizing the basic values of modern structures in Iran, which is generally created by imitating the West in the Pahlavi era, more difficult and has led to an increasing chaos in Iran's development process and consequently the administrative system of Iran.

# Politico-administrative Relationships in Japanese Context

Jun Matsunami
Graduate School of International Cooperation Studies, Kobe University, Kobe, Japan

## Definition

The power and influence relations between politicians and bureaucrats; which organization in the central government can control or influence over other governmental organizations; the reasons why (governing party) politicians can influence over bureaucracy.

## Synonyms

Bureaucratic control over important political decisions; Political control over the bureaucracy

## Section: Bureaucracy

### Introduction: Who Designed the Japanese Postwar Recovery?

When Japanese economy and society showed rapid recovery from the destruction of the World War II, some pointed out that it was the bureaucracy who designed the rapid economic development. In his famous *MITI and the Japanese Miracle*, Chalmers Ashby Johnson argued that there are five types of explanations about Japanese economic miracle. Among these five groups, Johnson wrote that he himself belonged to the school of the developmental state and argued that the bureaucracy played important role in Japanese economic miracle. He described the role and power of bureaucracy as follows:

In Japan, the developmental, strategic quality of economic policy is reflected within the government in the high position of so-called economic bureaucrats, [. . .]. These official agencies attract the most talented graduates of the best universities in the country, and the positions of higher level officials in these ministries have been and still are the most prestigious in the society. Although it is influenced by pressure groups and political claimants, the elite bureaucracy makes most major decisions, drafts virtually all legislation, control the national budget, and is the source of all major policy innovations in the system (Johnson 1982, pp. 20–21).

It should be noted that Chalmers Ashby Johnson, who later became famous as an anti-Japan Revisionist, analyzed Japanese economic policy as a different type from Anglo-American economic policy, but another type of a rational policy for a country like postwar Japan with its context.

In fact, in the United States, there was an understanding that the bureaucracy had played very important role in the prewar Japan. That was the reason why the bureaucracy became a target of the American-led postwar reform after World War II. However, at that time, the Ministry of Interior (Home) was the ministry which the American thought the need to reform to democratize Japan, because it controlled various important administrative functions including local government, police, and civil engineering (Pempel 1987, pp. 164–167). It was Johnson who found economic bureaucracy with a positive image even that the economic bureaucrats also played an important role during the World War II in war-related production and mobilization.

### Stronger Bureaucracy Hypothesis

Until the 1980s, many scholars in Japan argued that Japanese bureaucrats were stronger than politicians and the Japanese bureaucrats were more influential than the bureaucrats in many other democratic countries. They had an almost same understanding about the power of the bureaucracy with Johnson, but those Japanese professors valued the stronger bureaucracy rather negatively and described them as a possible danger against the infant Japanese democracy. The Japanese professors argued that bureaucracy could keep most of important decision-making power, just like the pre-World War II Japan. The Liberal Democratic Party (LDP), which formed the government after its foundation in 1955, rubberstamped what the bureaucracy had prepared as cabinet bills and budgets. Many important cabinet ministerial seats such as the finance minister and the foreign minister, key positions of LDP such as party secretary were frequently occupied by ex-bureaucrats. For example, they argued that among 15 prime ministers between 1955 and 1993 (when LDP lost the general election for the first time), 7 prime ministers were ex-bureaucrats and they served more than two-third of that period. The scholars argued that these were evidences that Japanese bureaucrats could keep the power and be stronger than the politicians.

Kiyoaki Tsuji was the most important professor who systematically argued the reasons of powerful bureaucracy and criticized it as a danger against postwar Japanese democracy. According to him, there are three reasons why the postwar Japanese bureaucrats could keep their power. They were the indirect rule by the Allied powers during the Occupation (1945–1952); the conviction of the Japanese people who believed the neutrality of the bureaucrats; and weakness of other political institutions (Koh 1989, pp. 204–205). Only small numbers of bureaucrats were purged from the ministries, and those top positions like vice ministers and director generals were filled by bureaucrats who were in the ministries and worked with the purged officials during the war. Many Japanese believed that bureaucrats kept themselves distances from dirty party politics. People believed that politicians received donation and sometimes even bribes and worked for those interest groups, but clean bureaucrats protected national interests. The army and navy were disbanded and officers lost their jobs and prestige. The politicians who were supported by the war cabinet during the 1943 general election and the business leaders during the war were purged. The Japanese bureaucracy kept and expanded their power because of these facts and images.

Many believed that stronger bureaucracy had rooted in the Japanese modernization history since the nineteenth century deeply. Many graduates of prestigious universities like Tokyo University sat the higher civil service examination and only those who passed the examination, i.e., the Best and Brightest joined the government as elite young bureaucrats. They were given OJT (on the job training) by moving one position to another position, sometimes in local offices (including prefecture and city halls) and other times in ministries in Tokyo. Some of them were given chances to go abroad for policy research. They drafted all government policy documents including government bills and budget. By accumulating these experiences, the Japanese bureaucracy was stronger than politicians who lacked systematic chances to learn policies (Nakamura 2005, pp. 21–23).

Stronger Bureaucracy hypothesis had been widely accepted both by academia and by journalists and has kept some influence even now. Karel van Wolferen's *The Enigma of Japanese Power*, which was published in 1989 and became a best seller at that time, argued that the bureaucracy still kept most important decision making power (van Wolferen 1989). When the Democratic Party of Japan (DPJ) won the 2009 general election and formed the government, they wanted to exclude the bureaucrats from the political decision making process by abolishing the administrative vice minister meetings which were usually held one day before the cabinet meetings. The DPJ politicians thought that all important decisions had been decided by bureaucrats before the cabinet meeting. To regain the decision-making power, they thought that it was important to abolish the administrative vice minister meeting. The DPJ also

wanted to move the decision-making process from the hierarchical ministerial meetings to the politically appointed team (minister, vice ministers, and parliamentary secretaries) in each ministry (Kushida and Lipscy 2013, pp. 32–33).

### Stronger Politicians Hypothesis

In the 1980s, however, Michio Muramatsu started to challenge the stronger bureaucracy hypothesis. Based on survey to elite bureaucrats, Muramatsu pointed out that at least by the middle of the 1970s, the self-image of bureaucrats had changed from "the state man" to "the moderator between various interests." He argued that Japanese politics-administration relation became similar to other liberal democratic countries, because Japanese bureaucrats accepted the stronger power of the politicians. According to Muramatsu, the fundamental base of politics, the legitimacy of the government, has changed by the New Constitution after the World War II. The Diet and the politicians as a whole gained the legitimacies because they were popularly elected by the people who had the sovereignty. First, the constitutional changes came, then, the changes of the understandings and behaviors of the people happened. Finally, bureaucrats' self-image changed (Muramatsu 1981).

If Muramatsu's argument presumed that certain years were needed to change mindset of the Japanese bureaucracy to accept the political power based on democracy, Ramseyer and Rosenbluth (1993) pointed out that the politicians' successful monitoring made bureaucrats behaved just what politicians wanted by using the rational choice theory. They argued that by controlling promotion in the ministry and post-ministerial salaries, Japanese governing party politicians could have a relatively responsive bureaucracy. Ramseyer and Rosenbluth argued that even the bureaucrats drafted governmental bills and the bills were enacted without any changes, they were already what the principal, i.e., the governing party Diet members wanted. By monitoring bureaucrats, politicians could remove those bureaucrats from key positions who drafted bills against politicians interests, while could promote to higher positions and allow higher post-ministerial salary to the bureaucrats who prepared favorable bills.

Stronger Politician hypothesis is now widely accepted both by academia and by journalists. Newspapers and TV news used to report on what the elite bureaucrats said and what the advisory bodies of the government were arguing about the policies. Now they cover more about what the governing party internal organizations like the Policy Research Council (PRC) of the LDP argue and what influential politicians say. If there are differences between bureaucrats-preferred and politician-favored policies, now what the PRC members agreed, what senior politicians said, becomes the government policy.

### Politico-Administration Relations after the 1990s

After the 1990s, politico-administration relations have changed as the surrounding environments of the government changes. Two former administrative vice ministers were arrested and were later found guilty in The Recruit scandal (1988), while another administrative vice minister was imprisoned by another bribe case. The Ministry of Finance (MOF) bureaucrats were found guilty in the misconduct in the banking industry regulatory administration, which led the reorganization of the MOF itself. Now the banking industry is regulated by the Financial Services Agency, which is independent from the MOF.

Japanese people lost their trust to the bureaucracy by these repeated scandals caused by the elite bureaucrats. After these scandals, we saw populist politicians and their parties repeatedly tried to use anti-bureaucracy emotion among the people to increase the support to them.

Another important change in the 1990s was that for the first time, the LDP lost general election in 1993. Although LDP backed to the government by a coalition with Socialists in the following year, this experience also affected politics administration relation after the 1990s. The LDP no more gave a full trust to its agent, the bureaucracy, because the bureaucracy cooperated with non-LDP coalition government. Therefore, the LDP started to discuss about

bureaucracy reform in the 1990s (Nakamura 2005, pp. 30–36). In 2006, a cabinet minister was created to take charge of civil service reform, and in 2008 the national civil service reform act was enacted. In the following year, 2009, the DPJ won the general election and formed the government, but they were more critical against the bureaucracy, as already explained.

Masaru Mabuchi argued that in the recent years, the anti-bureaucracy sentiments among the people shrinked the Japanese bureaucrats. Based on the survey results, he wrote that their self-image became "the servants," which he described as a bureaucratic syndrome (Mabuchi 2006, p. 156).

### Cabinet Bureau of Personnel Affairs

We should understand the establishment of the Cabinet Bureau of Personnel Affairs (CBPA) in 2014 on this context. (CBBA's web address is as follows: http://www.cas.go.jp/jp/gaiyou/jimu/jinjikyoku/ (In Japanese only).) A Deputy Chief Cabinet Secretary (Political) was appointed as the first Director General of the CBPA and it started to control around six hundred top bureaucrats (deputy director general class and above) personnel administration. It was created by the Abe LDP-Komeito coalition government, which had experienced the oppositions (2009–2012) and another distant relation from the bureaucracy. It was widely said that by establishing CBPA, Abe LDP-Komeito coalition government obtained another tool to control the bureaucracy.

However, in 2017, the same Abe government appointed a senior bureaucrat to the Director General of CBPA after the government faced criticism from the oppositions and public opinions. Although there remains anti-bureaucracy sentiment, too much control to the bureaucracy is also unpopular.

### Conclusion

We can say that now Japanese politicians are stronger than bureaucrats in political process just like other democratic countries. Politicians can monitor and control bureaucrats, and bureaucrats behave to materialize what the governing party politicians want. However, it is still not so clear that how much politicians are stronger than bureaucrats. There also remain some unsolved questions. How politicians should exercise their power over the bureaucracy? How a current governing party should intervene personnel administration of top elite bureaucrats?

It should be noted that Japanese bureaucracy cannot be separated from the Japanese society. Unlike the United States, and like most of European countries, Japanese labor market is, and will be, a semiclosed market. Many, if not all, bureaucrats get a job in the government when they are young and stay in the government during the most of their working ages. The recruitment of brighter younger generations and keeping their motivations high are essential for the management of the government now and the future. The development of a good politics-administration relation matters to the management of the government in the long run.

## Synonyms

Political-administrative relations; Politics-administration dichotomy; Politics-administration relationship

## Definition

Politics and administration is the study of theoretical relationship between political and administrative realms of government. It attempts to understand both normatively and empirically if, and to what extent, these two sets of activities differ from each other. Specific areas of inquiry cover links, similarities, and differences between the two domains of government.

## Introduction

The relationship between politics and administration has been, perhaps, the most fundamental question in the field of public administration since its emergence as a self-acknowledged discipline in the late 1880s. From the dawn of human civilization, states have had clearly distinguishable administrative apparatus in place to implement policies of their rulers; systematic study of this apparatus, however, is a fairly recent phenomenon. It is common in the field to mark 1887 as the foundational year for public administration, at least, in the United States. In that year, a young scholar named Woodrow Wilson published an article entitled "The Study of Administration" in Political Science Quarterly in which he implied a strict separation between political and administrative spheres of government. It was later called "politics-administration dichotomy" and has had a lasting influence on both theory and practice of public administration. Challenged very often in the field, both on empirical and normative grounds, the politics-administration dichotomy has lost most of its early appeal in the field and was replaced by more practical and accurate models of politics-administration relationship. The debate on how to link politics and administration in a democratic government continues to engage both scholars and practitioners, as the question has significant implications for both institutional development and intellectual identity of public administration.

## The Politics-Administration Dichotomy

When putting this term in its historical context and social setting, it should be noted that the politics-administration dichotomy was a strong reaction to inefficient government caused by partisan political influences on the daily affairs of administration since the inauguration of Andrew Jackson as the president of the United States. Following the assassination of James Garfield in 1881, this period of so-called spoils system came to an end with the passage of Civil Service Act (a.k.a., Pendleton Act) in 1883. This act marks the beginning of the merit system in the United States by prohibiting personnel practices based on partisan considerations and introducing competitive civil service exams in the hope that only the qualified people with the right mix of knowledge, skills, and abilities would be placed in public office. Their selection, promotion, discipline, and compensation would be based on knowledge, skills, and performance, not on political loyalties. Since partisan influences had been blamed for widespread corruption, waste, and incompetence in government, the progressive movement aimed to minimize the role of politics in daily, routine affairs of administration. It is not coincidence that Wilson's article was published only 4 years after the passage of Pendleton Act. The idea is simple. There should be a sharp separation between political and administrative domains of government. Politics is about

policymaking, a set of activities that involve value choices. This domain is responsible for deciding "what to do" or, as Wilson (1887) put it, "setting the task" for administration. Administrative domain, however, is for policy implementation, a set of activities that involve translating political choices into concrete accomplishments with the aid of technical knowledge and skills called expertise. In the years following Wilson's article, other contributors made this rudimentary idea a normative theory, further to be used to perfect administrative apparatus of government and to draw the boundaries of public administration.

## Evidence on Political-Administrative Relations

Following World War II, however, the politics-administration dichotomy has been criticized and attacked by opponents on both normative and empirical grounds. Normatively, the inherent limitations of the concept of dichotomy were clear. If public administration is all about policy implementation in a value-free and neutral manner, then it was easy to use this apparatus for evil purposes, like it was done in Nazi Germany during WW II. Politics-administration dichotomy leaves no room for public administrators to question the ethical foundations of public policies or political orders, and they cannot act upon their assessment of what is right and what represents the public's best interests. Knowing that public servants are human being with values, emotions, and ideologies, the politics-administration dichotomy sits on a very shaky foundation, sounding somewhat naive, leading critics to say that it is nothing more than political metaphysics. Empirically, a non-trivial amount of research showed that political and administrative domains are linked and they are in constant interaction. Politicians often interfere with administration, mostly for the benefit of their constituencies, and administrators also get involved in policymaking due to their expertise. Studies at federal, state, and local levels of government in the United States have revealed a complex web of interactions between political and administrative spheres. Vague and ambiguous legislations often leave public administrators with significant latitude and discretion to make their choices when they begin implementing public policies. Bureaucratic expertise also gives public administrators an important edge over policymaking, as they are frequently called upon by their political superiors for their knowledge and skills. As policy issues evolved and grew even more complex, an expert cadre of bureaucrats became very critical for society. Also, lack of a strong political center, which should provide consistent, fast, and clear policy direction and support to administrative agencies, makes power and politics a necessity for managers (Long 1949). On the other side of the dichotomy, elected officials have always maintained a keen interest in the administrative domain. Since their reelection depends on satisfying their constituencies and public administration is responsible for routine, daily decisions that affect the lives of citizens, it becomes a political necessity for elected officials to seek influence in the administrative affairs and routine decision-making processes. This is known as casework and makes up an important part of any elected official's work.

Empirical studies in the literature generated very little evidence, if any, to support a sharp separation between political and administrative domains of government. Observations and empirical tests in local government research have actually provided strong evidence against the dichotomy view, corroborating the significant roles played by professional administrators in the policymaking process. Public administration scholars have produced a substantial amount of research output on the role of public administration in the broader political processes and policymaking. Research methodologies used to provide evidence against the dichotomy varied including interviews, anecdotal evidence, case studies, personal experiences, comprehensive surveys, descriptive data analyses, and theoretical model construction and evaluation.

Examining politics-administration relationship in US local governments, some scholars utilized descriptive data analysis to determine the degree

of politics versus professionalism in public administration. Newell and Ammons (1987), for example, studied the time allotment patterns of municipal managers and found that city managers spent an average of 17% of their total time for political roles that involved community leadership. Similarly, French (2005) evaluated time allocations of mayor and managers in small cities and towns. His research found that managers in small cities and towns spend more time on policy and management activities and less time on political activities than mayors.

Some researchers attempted to test theoretical models using both qualitative and quantitative methodologies. Browne (1985) tested Svara's dichotomy-duality model (re: complementarity model) and found some supportive evidence for that model; however, the research had an important limitation in that it examined only policy initiatives. Dunn and Legge (2002) used three models that they culled from the literature and surveyed local government managers to understand whether public administrators' relationships with elected officials conform to the three models that public administration scholars had used to characterize that relationship. Dunn and Legge (2002) found empirical evidence supporting a partnership model, pointing to the strength of blending politics and administration in policy development and administration. Demir and Nyhan (2008) specified a theoretical model of politics-administration dichotomy and tested the theoretical model with comprehensive survey data collected from city managers. Their research failed to provide support for the politics-administration dichotomy, a model that favors very limited policy role for public administrators.

Summarizing the outcome of various research and observations, Van Riper (1983) concluded that:

> As we all should know by now, politics and administration are inextricably intermixed. Both are central to effective action. One problem is to bring them together in a symbiotic association yet keep each in its proper place. The other is to understand that the "proper place" of each will vary through time. There is no permanent solution, no fixed paradigm, to this or any other ends-means continuum. (p. 489)

## Roles that Public Administrators and Elected Officials Play

It is perhaps an oversimplification to subsume all public managers in one type, portrayed as neutral, expert, and apolitical, or the opposite, as highly politically involved. Prior research identified a diverse set of roles played by administrators. Scholars proposed typologies that would help distinguish more active managers from less active ones. In his study of city managers, Loveridge (1968) identified nine roles for city managers. They can be policy innovators, policy advocates, budget consultants, policy administrators, policy neutrals, political advocates, political leaders, political recruiters, and political campaigners. Lewis (1982) examined the role behavior of city managers and proposed seven roles, extending from "traditional textbook administrator" to "near-boss type." Moore (1995) offered two distinct roles for managers as technicians and strategists. The research on role conceptions places city managers' roles on a continuum from political to professional. City managers with political role definitions are more likely to get involved in a variety of policymaking activities, whereas those managers with a greater focus on professionalism would refrain from policymaking and give much of their attention to policy implementation tasks.

The same can be said about elected officials. Their involvement in administration is subject to significant variation. Some are more involved and do play the role of micromanagers. Some are relatively distant and deal mostly with broader political issues. According to Svara (1999), some elected officials, at the local level, are electoral activists and they try to help their constituents by acting as their spokesperson and representative. These elected officials are willing to make a major investment of time and talent to gain and exercise political influence. Electoral activists, according to Svara (2002), are often involved in administrative sphere by playing the role of ombudsman and attempting to promote responsiveness to constituencies. This role is very different from what Svara (2002) calls the trustee role, which requires no involvement in administrative side of the policy process.

As identified by empirical research, the roles played by appointed and elected officials vary significantly and are contingent on a variety of external and internal factors. Demir and Reddick (2012) modeled some of those factors that increase cross-functional contributions of elected and appointed officials into policymaking process. Their findings show that a manager's role conception and elected officials' expectations increase managers' involvement in the policymaking process. On the other hand, the context of policymaking, elected officials' access to resources, and managerial support to elected officials are factors that enhance elected officials' involvement in the administrative activities. More research in the future will likely provide a more refined understanding of how elected and appointed officials define their roles.

## Complementarity View: An Alternative

A search for a better conceptualization of politics-administration relationship resulted in a number of models. Complementarity is one of them and emerged as both descriptively more accurate and a normatively desirable model and has gained prominence in the literature.

The complementarity view rests on the premise that there is a continuum between politics and administration. This notion implies that elected officials and public administrators should be active in all dimensions of the governing process, from developing and determining missions and policies to administering and managing policies and programs. Most of the research on the complementarity view has been done in US local governments. Henry and Harms (1987, pp. 154–55) specified the four constructs of the continuum as follows:

1. Mission: identifying public concerns, problems, or needs for services that require agency action.
2. Policy: developing goals and plans for agency action that address identified concerns and determining how much of the agency resources should be allocated to carry out the plans and goals.
3. Administration: reassessing the plans for agency action to determine if the concerns are being addressed or the goals are being achieved.
4. Management: establishing administrative procedures to carry out the plans for agency action.

According to this model of political-administrative relationship, elected officials play a much larger role in developing mission and public managers play a dominant role in management. However, policy and administration are open to the contributions from both sides. Complementarity model encourages elected officials and public administrators to frequently interact and cooperate in policymaking process by acknowledging overlapping roles and shared responsibilities. As Nalbandian (1999) states:

> In an evaluation not too long ago, one of the Commissioners suggested that she would be more comfortable if I brought to her the projects as I was working on them rather than when they were completed. She used the analogy of a baby. She said she was part of the family and she wanted not only see the clean baby with a shiny ribbon in her hair, but she wanted to see the baby, messy diaper and all. (p. 194)

Complementarity conceptualizes the relationship between politics and management as a continuum. One part of the continuum is construed between politics and policy and the other is between administration and management. Complementarity is often called dichotomy-duality as it accepts duality between policy and administration, the two areas toward which elected officials and public administrators are expected to make substantive contributions. A dichotomy, however, is preserved for the polar ends of politics and management.

According to the proponents of the complementarity view, public administrators do and should engage in various policy activities, yet should refrain from what falls within the realm of politics, especially political partisanship. What makes an activity political or policy is answered

by complementarity scholars with reference to (1) partisan nature of the activities and (2) leadership initiatives of managers taken "independently" from elected officials. According to the complementarity view, elected officials do and should engage in administration, yet should refrain from what falls within the realm of management. The question of what makes an activity administrative or management is answered by complementarity scholars with reference to the impact of that activity on (1) administrative integrity and (2) management efficiency. The activities undertaken by elected officials, if they interfere with administration in issues that clearly fall within the authority of administrators (e.g., appointments to management positions, bypassing the manager and giving orders to lower level personnel), are considered to be intrusions into management. This kind of activities not just undermines the authority of public administrators but also weakens their control over organization and staff. Also, elected officials' activities that circumvent routine and consistent enforcement of adopted policies are considered to be political intrusions into management. The complementarity view seems to be a middle ground between the dichotomy and political bureaucracy perspectives, in that it acknowledges "the logical and psychological distinctions" between politics and administration but also addresses the problem of bringing the two together in a symbiotic association yet keeping each in its proper place.

In one of the most comprehensive empirical tests of the complementarity view, Demir (2009) administered a nationwide city manager survey to explore the idea of a continuum in political-administrative relations. His findings support the existence of overlapping roles and mutual influence between elected and appointed officials when it comes to policy and administration. The research also found that political and management activities are characterized in a way closer to the dichotomous view. Complementarity has been supported by a nontrivial number of other empirical studies, and review of the extant literature shows that this model has emerged as a strong alternative to the politics-administration dichotomy (Georgiou 2014).

## Conclusion

Politics and administration relationship is considered one of the most important questions in the field. That the overly simplistic notion of the dichotomy has been discredited does not mean that the field developed a conclusive answer to this long-standing issue. The research on this question will continue to remain important in the foreseeable future and more research is likely to be generated in the years ahead. Demir and Nyhan (2008) suggest that to settle this issue, three things need to be done. First, a more cooperative relationship between politics and administration should be conceptualized as the complexity of problems challenge traditional boundaries and require constant interaction, shared responsibility, and reciprocal influences. Second, the alternative model(s) should be evaluated with systematic and data-based research to identify patterns in practice. Third, empirical evidence should be provided for that the alternative model produces desired results without compromising democratic accountability and administrative performance.

# Politics and Aid

Katherine V. Bryant
Westmont College, Santa Barbara, CA, USA

## Synonyms

Aid allocation; Aid effectiveness; Development assistance; Development politics

## Definition

Politics and aid refers to the ways in which domestic and international political forces shape policies related to foreign aid.

## Introduction

Aid is perhaps one of the most debated topics in foreign policy. Despite decades of research, controversies persist on issues such as how much money should be spent on aid, who should receive aid, and whether aid is actually promoting the welfare of recipient countries. These are important questions to ask because aid has the potential to drastically alter the global landscape by eliminating poverty and promoting good governance. However, achieving this success is fraught with political difficulties for both donors and recipients. Finding support for aid, determining how it is allocated, and evaluating its effects are all suffused with political influences from individuals, donor countries, international institutions, and the recipients themselves. As global priorities shift and poverty continues to thrive, future aid research will have to address more fully the political nature of aid policies. After providing some background information on foreign aid, this article examines the political nature of three aspects of aid: how much aid is supported, where and how aid is allocated, and whether or not aid has been successful in promoting development. The article concludes by summarizing future directions for foreign aid research.

## Who Provides Aid?

What exactly is foreign aid? Lumsdaine (1993) defines aid as "gifts and concessional loans of economic resources, such as finance and technology, employed for economic purposes provided to less developed countries by governments of the developed democracies, directly or through intermediaries such as UN programs and multilateral development banks" (Lumsdaine 1993, p. 33).

The Organization for Economic Co-operation and Development (OECD) defines aid, or official development assistance (ODA), in much the same way. According to the OECD, aid must be provided by official donors such as governments, their executive agencies, or multilateral institutions with the intent of furthering the economic welfare of its recipients. Military aid, peacekeeping, and anti-terrorism activities are therefore excluded from ODA. Aid can be given as general budgetary assistance, also known as program aid, or as project aid where it is directed toward a specific project within the recipient country. Project aid can support activities in sectors such as healthcare, education, infrastructure, promoting governance and civil society, or supporting certain economic production areas.

As noted above, there are two types of donors that can provide ODA. The first are donor governments, or bilateral aid. Within the OECD, 29 countries are members of the Development Assistance Committee (DAC) which serves as an international forum for the largest aid donors. Table 1 lists the members of the DAC. As Table 1 demonstrates, the majority of the countries included in the DAC are from Western Europe and North America. While these countries still provide a significant portion of today's ODA, the number of non-DAC aid donors is growing, as is the size of their aid contributions (Woods 2008). China, for instance, provides billions of dollars in aid, especially to African countries. Saudi Arabia, Brazil, and India are also notable aid donors that are not members of the DAC. While most analyses of aid have focused their attention on ODA from DAC members, more recent research has focused on the quantity and quality of aid from these rising non-DAC donors.

The second type of donors that can provide ODA is multilateral aid agencies. A multilateral agency is an international organization whose primary purpose is to promote development. The agency is funded by donor countries and then pools these funds and subsequently determines how, where, and when to allocate those funds. This creates a principal-agent relationship between donor governments and multilateral aid agencies. Multilateral aid agencies include development banks, UN agencies, and regional groupings. Although not exhaustive, Table 2 lists 40 of the most prominent multilateral aid agencies operating today. It should be noted, however, that hundreds of additional multilateral aid agencies also exist.

Within multilateral aid funding, there is also an important distinction in the type of aid they receive. In recent years, donor countries have increasingly funded multilateral agencies through noncore aid contributions. These noncore aid funds are earmarked for a specific recipient, sector, or project, essentially undermining the ability of multilateral agencies to determine their own aid policies for these funds. In 2012, donor governments contributed $17 billion to multilateral aid agencies through noncore funding, accounting for 13% of all ODA (Tortora and Steensen 2014, p. 7). Noncore funding is becoming more prevalent as well, growing by 8% from 2009 to 2010 (*Multilateral Aid Report*, 2012). The consequences of this shift from core to noncore funding of multilateral aid agencies remain to be seen. On the one hand, it may allow donor governments the opportunity to distribute aid to a desired sector or recipient that they may be unable to reach if acting independently. If the specified sector or recipient is largely ignored by the aid community, then the provision of noncore aid from the donor government may be beneficial. However, there are negative aspects associated with earmarked funding

as well, such as increasing the administrative costs incurred by multilateral agencies, as well as potentially undermining their overall utility by diminishing the agency's control over its own funds.

Bilateral and multilateral aid organizations each offer different types of benefits. Bilateral aid enables the donor state to maintain control over how aid funds are used. This allows the donor government to pursue their national interests or ensure that domestic firms are chosen to implement developmental projects. Multilateral aid, on the other hand, takes control away from the donor states and invests it in a third party. Rather than being controlled by a single donor government, a multilateral aid agency is governed by a group of contributing donor governments. Since the preferences of the donor governments are aggregated into a single agency, multilateral aid is able to operate in an environment further removed from the domestic political constraints that are often placed on bilateral aid agencies. These constraints are discussed in more detail in the sections below.

## Determining Support for Foreign Aid

Decisions regarding foreign aid allocation – choosing who gets how much and in what form – have sparked continued domestic and international controversy. Although in 1970 the

international community established a target for DAC members to contribute 0.7% of their gross national product (GNP) to ODA, this standard has only been met by a handful of countries. In fact, DAC members on average have never contributed more than 0.4% of their GNP. To a large extent, researchers have attributed this shortcoming to a lack of public support for aid, as well as country-specific factors that may impact aid policies. In a broad analysis of both of these explanations, Paxton and Knack (2011) use two global public opinion surveys to investigate what determines support for foreign aid, both at the individual and country levels. Using a multilevel model, the authors find that for individuals, factors such as gender, income, political ideology, religion, interest in world affairs, and trust in foreign aid and government all have significant effects on levels of support for foreign aid. Women and individuals with higher incomes generally support foreign aid more. The authors also find that individuals with left-leaning political ideologies have more positive views toward foreign aid, supporting other researches that have been previously conducted regarding aid and political ideology. At the country level, the authors find that richer countries are generally more supportive of increasing aid, although larger countries are less supportive. Countries that are former colonizers are also more likely to provide greater levels of aid. Last, countries that already provide relatively large amounts of aid are significantly less supportive of increasing those amounts.

It is worth briefly returning to the question of ideology's influence on support for foreign aid. Conservative governments are generally critical of foreign aid for two main reasons. The first is that it creates redundancy and undermines efficiency in the developing world. Rather than providing loans and investment through aid funds, conservatives argue that privatization would be more pragmatic. Second, aid is resisted as it is thought to be similar to the welfare state, leading to higher taxes and greater government dependence. Liberal governments, on the other hand, are generally expected to support foreign aid as it addresses unequal income distribution on an international level. Somewhat surprisingly, research in this area remains rather limited. While several studies have examined government ideology and support for aid, their analysis has generally been restricted to short cross-sectional analyses. Tingley (2010) presents a thorough test of these arguments by examining the influence of various political factors on aid. Using a time-series cross-sectional analysis of DAC donors from 1971 to 2002, he presents the most comprehensive test of this relationship. His results indicate that conservative governments are indeed less likely to provide aid than liberal ones. Interestingly, he also finds that this relationship is especially pronounced for aid flows to lower-income developing countries and multilateral aid agencies, whereas conservative governments continue to support aid to developing countries with higher income levels. Such a result may be attributed to the importance of economic policy on aid flows, which is addressed in the next section.

## Debates on Aid Allocation

When the era of foreign aid began in the 1950s, for the first time ever, there appeared a systemized sense of moral obligation by states to help those that were less fortunate. As articulated in Truman's inauguration speech after World War II, Western states believed that "...only on the basis of a just international order in which all states had a chance to do well was peace and prosperity possible" (Lumsdaine 1993, p. 30). The vision was that foreign aid would help contribute to world peace by encouraging development in poor countries and alleviating the suffering that underlies violent uprisings. In reality, however, aid quickly became a tool of statecraft, one that often disregarded the needs of the developing world in order to ensure the advancement of political agendas. This is particularly true of bilateral aid donors, who often give aid in a manner that benefits their own political or economic interests. Although initially meant to spur development, bilateral aid is now often cited as a political tool that can be used to extract valuable policy concessions from recipient governments or

to gain support for foreign allies. For instance, in their game-theoretic model, Bueno de Mesquita and Smith (2007) demonstrate how bilateral aid is used by recipient leaders to bolster their domestic political support. In return, recipient leaders offer policy concessions to donor governments, often in the form of political or economic benefits to the donors. Political factors such as military importance, past colonial relationships, and UN voting behavior are all prominent factors driving aid allocation. During the Cold War in particular, the USA gave substantially more aid to its allies. Although this trend diminished in the 1990s, the events of September 11th prompted a renewed motivation for aid to be provided for political purposes.

Recipient countries can also attract foreign aid by offering potential economic benefits to donor governments, including access to natural resources, favorable trade terms, and domestic policies that support donor firms. This type of economic patronage is often provided in the form of tied aid, or aid that is dispensed with the contingency that the goods and services it provides be implemented or sourced by the donor state. For example, Fleck and Kilby (2001) found that of the $12.9 billion that the US Agency for International Development (USAID) provided in contracts during 1995, $11 billion of that went directly to US firms. Other studies have documented that the more goods a recipient imports from a donor government, the more aid they are likely to receive from that donor. This limitation on the choices that a recipient country has for actually using their aid can significantly constrain aid effectiveness. According to one study, tied aid is 15–25% less cost-effective compared to untied aid (Clay et al. 2009). While the percentage of untied bilateral aid from DAC members has grown in recent years, there is still much improvement to be made.

In contrast to the political and economical motivations that underlie aid provided by donor governments, multilateral institutions base their allocation patterns on different factors. Multilateral institutions are more likely to be concerned with issues of recipient need and the quality of governance, indicated by factors such as democratic political institutions, the rule of law, and respect for property rights. In this way, multilateral aid is more "selective" than bilateral aid (Dollar and Levin 2006). Further research has also demonstrated that multilateral agencies base their aid allocations on human rights considerations as well, whereas bilateral donor do not appear to factor human rights abuses into their allocation decisions (Neumayer 2003). On the other hand, multilateral agencies have been criticized by environmentalists for failing to be responsive to the environmental concerns of recipient countries (Hicks et al. 2010). Furthermore, substantial variation exists within multilateral agencies with regard to their allocation patterns. Neumayer (2003), for example, finds that UN agencies are more likely than regional development banks to be concerned with human rights issues.

A final factor to note within multilateral aid allocation policies is that the internal characteristics of the agency can also affect their distribution patterns. Schneider and Tobin (2013) demonstrate this by discussing political interactions occurring within the European Commission (EC). The authors find that when there is a powerful coalition of members within the EC, they are able to manipulate its actions and direct more aid to countries that they have economic, political, or strategic interests in. However, when the members have divergent preferences over allocation, they are unable to manipulate the actions of the EC, allowing the agency to distribute more aid to poorer countries. Therefore, although multilateral aid agencies are more removed from domestic political influences, they are not free from them.

## Debates on Aid Effectiveness

The third aid-related debate addressed here is that of foreign aid effectiveness. Essentially, the question is whether or not aid is actually promoting development. Although development can encompass multiple factors including improvements to healthcare, education, access to clean water, and improved government institutions, the majority of the studies have focused on the relationship between aid and economic growth rates. Aid is thought to contribute to the economy of recipient

countries through increasing capital spending, transferring technology or knowledge, leading to changes in economic and political institutions, and enhancing worker productivity through improved healthcare and education.

The current state of the literature regarding aid's effectiveness is quite mixed. While several studies conclude that aid and growth have a generally positive relationship, much of the literature has produced conditional findings. The seminal work by Burnside and Dollar (2000), for instance, demonstrates that aid can increase economic growth when it is given to countries with good political institutions. Although this finding was challenged by Easterly et al. (2004), other studies have also concluded that aid can be effective when given in a conditional manner. Several studies, however, have sharply challenged this finding that aid has led to economic growth, even if this finding is conditional. These critics argue that aid actually undermines economic performance in that it reduces savings, leads to currency appreciation, and discourages private investment (Radelet 2006). Aid has also been criticized because it is seen as contributing to corruption and perpetuating the rule of autocratic leaders. According to this argument, aid insulates leaders from domestic politics as it allows them to ignore public opinion and utilize aid for personal gains. As a result, it is more difficult for these autocrats to be overthrown domestically and their often incompetent rule is maintained at the cost of achieving positive development results.

Much of this discrepancy in the literature is due to a large degree of variation in the data and methodological specifications of empirical tests of aid and growth. Of particular concern for researchers has been the difficulty of properly modeling the potentially endogenous nature of aid and growth. That is, while aid may be spurring economic development, it is also possible that aid is targeted toward countries with better economic performance. Finding ways to deal with this endogeneity has ranged from using instrumental variables to using a generalized method of moment estimation which is more sophisticated but also more sensitive. Other empirical issues include the amount of time over which aid's impacts are evaluated, the type of aid that should be expected to improve economic growth rates, and potentially nonlinear impacts of aid. As methodological approaches improve, so too will future analyses on aid effectiveness.

## Conclusion

Despite being the subject of an immense amount of research for the past 60 years, there is still much work to be done in terms of understanding foreign aid. In particular, future research must address new political influences that are shaping aid policies. These include the rise of noncore aid, which may substantially alter the operations of multilateral aid agencies. Also of growing concern is the rising prominence of new donors within the aid community. While developed democracies have been the dominant sources of aid donations for decades, non-DAC countries in emerging economies have been providing increasing levels of development aid. Future research should examine both the domestic determinants of this aid and its effects in addressing global poverty. Last, while aid recipients have often been on the outside of decisions regarding aid policies, today they are taking on a more prominent role. With increased calls for cooperation, recipients have potentially more influence over aid policies today than ever before. Whether or not this influence and the actions of both DAC and non-DAC donors can push development further and help in achieving the Sustainable Development Goals (SDGs) before 2030 remains to be seen.

# Politics and Bureaucracy

Nathan Favero
Texas A&M University, College Station, TX, USA

## Synonyms

Bureaucratic politics

## Definition

Politics and bureaucracy refers to the role that government bureaucracies play in making policy or resolving political conflicts.

## Introduction

Governments make important determinations about how social resources are to be distributed and how public justice is to be dispensed. While many key governmental decisions are made by traditional political actors – such as presidents, legislatures, and courts – implementation of many policies is carried out by bureaucracies. Implementing policy is often a complicated task, and many government bureaucrats have substantial discretion over implementation decisions, including in policy areas that lack political consensus. As such, bureaucracies are an important actor to examine when considering how political systems operate. Although bureaucrats often play a key role in implementing policy, they may not enjoy the same level of legitimacy as other political actors, particularly in the context of a democracy where bureaucrats may be compared to other officials whom the public has elected. This encyclopedia entry discusses why bureaucracies are involved in political decisions, where bureaucracies fit into the broader policy making landscape, and some ways that bureaucracies can potentially be held accountable in the context of a democratic government.

## Limitations of the Politics-Administration Dichotomy

One simplistic view of bureaucracy attempts to separate administration from politics. Under the politics-administration dichotomy, traditional political actors (legislatures, elected executives, and political appointees) are the arbiters of political conflicts, while government bureaucrats merely administer political programs and make technical judgments based on their expertise (Frederickson et al. 2012). The political actors

determine what values should be pursued and how they should be prioritized, while bureaucrats determine the technical means of pursing those values and priorities. Under this view, public administration is a completely neutral, apolitical activity, and the personal or political values of bureaucrats should not affect their work.

While the politics-administration dichotomy provides an interesting ideal to consider, the division between politics and administration is not a clean one in practice. On the one hand, the details of many political decisions are sorted out within bureaucracies. For example, within constraints given to them by political authorities, public school staff decide how to prioritize various student needs, such as core academic learning, extracurricular learning, socioemotional learning, and even health and fitness needs. At the same time, political actors often write into statute certain administrative determinations regarding which technical means will be used to pursue particular ends. Legislation might require the use of a specific type of screening equipment by airport security officers, or elected officials might effectively prohibit the development and manufacture of a particular type of military equipment by failing to fund it.

Political scientists often use principal-agent theory to conceptualize bureaucratic politics. Viewed through principal-agent theory, legislatures or other traditional political actors serve as principals who enlist bureaucrats as agents to implement policies. The political actors must give bureaucrats some degree of discretion in order for the bureaucrats to be able to effectively implement policies, and the political actors cannot perfectly monitor the behavior of the bureaucrats. Bureaucrats sometimes use their discretion to pursue objectives other than those on which the political actors have agreed. In other words, bureaucrats may decide to use their discretion to allocate resources or prioritize objectives in a manner somewhat inconsistent with formal policy, thereby effectively amending the political decisions of the elected officials.

Even if elected officials could perfectly monitor and control the bureaucracy, bureaucrats would still have to make political decisions in areas where elected officials have not fully resolved political disputes. This cause of political decisions pouring over into the bureaucracy can be described in terms of goal ambiguity, a topic that has received much attention among public administration scholars. Bureaucracies often face substantial goal ambiguity, meaning that political actors do not provide bureaucracies clear direction regarding the goals that they are to pursue. It can be very difficult for political actors to specify (in legislation or otherwise) exactly how they want competing priorities to be balanced. Many policy issues are so complex that it may be impossible to specify goals in enough detail for bureaucrats to always know how various factors should be weighed when facing a decision. Bureaucracies can also face trade-offs that were never foreseen by the political actors originally tasking a bureaucracy with the implementation of a policy, perhaps because of a shock like a technological change. In some cases, political actors may have been unable to agree on how to settle a political disagreement regarding the establishment or prioritization of goals and have thus deliberately left it up to the bureaucracy to resolve such political disputes.

Whatever the cause, a lack of clear direction from political bodies regarding what a bureaucracy should aim to achieve makes it necessary for the bureaucracy to make such political determinations itself. In practice, bureaucracies routinely make decisions that are political in nature, often creating winners and losers in society. Some of these decisions are made at the level of street-level bureaucrats, as when a police officer decides whether or not to issue a citation for a traffic violation. In other cases, higher-level officials within a bureaucracy create or amend rules and procedures for the bureaucracy that inevitable prioritize certain interests over others.

Bureaucracies and their officials can also informally affect policy decisions by attempting to influence elected officials' use of legislation and other forms of policy making. Bureaucratic officials can be called upon to testify before legislative bodies that are considering passing new legislation. Some bureaucracies, such as intelligence agencies, exist in large part in order to provide information to elected officials who are

making policy decisions. These avenues give many bureaucracies a direct means of interacting with elected officials and thereby influencing elected officials' policy making decisions.

## Policy Disputes and Bureaucracies

Given that policy decisions are made within the bureaucracy, who exerts influence over these decisions? One basic framework that can help answer this question describes how various actors affect policy making in the US national government and is known as iron triangles or policy subsystems. An iron triangle consists of three actors – an interest group (or multiple groups), Congress, and a bureaucracy – that contribute to policy decisions in a given policy area. Though iron triangles generally describe policy making at the level of the national government in the USA, similar arrangements with somewhat different actors may be found in other governments.

Interest groups are nongovernmental entities that have an interest in the outcome of bureaucratic policy decisions and that actively work to promote their interests to government officials. In the context of a regulatory bureaucracy, the interest group is usually the industry being regulated. Policy capture refers to bureaucratic decision-making that is heavily influenced by an interest group, with the interest group typically being the regulated industry. In its most extreme form, policy capture implies that the industry so dominates the bureaucratic policy making process that a regulatory agency serves to benefit the interests of the regulated industry at the expense of other social interests. The existence of a "revolving door" whereby individuals easily move between jobs within the bureaucracy and jobs within the interest group can facilitate policy capture. If bureaucratic behavior that is favorable toward the industry improves a bureaucrat's future prospects of obtaining a desirable job in the industry, revolving doors produce incentives for bureaucrats to favor the regulated industry's interests.

Under the framework of iron triangles, Congress also plays an important role in forming policy. Since iron triangles form around specific policy areas, the most frequent congressional participation in a policy area occurs at the level of congressional subcommittees. These subcommittees serve in an active oversight role with regard to the bureaucracy, and their staff are generally specialized experts in the policy area of their subcommittee. Subcommittees hold formal authority with regard to initiating legislation, but they also hold informal power over bureaucracies. Since Congress plays a central role in allocating resources to bureaucracies through the budgeting processes, bureaucracies have an incentive to demonstrate to their subcommittees that they are effectively achieving objectives that are important to current members of Congress. Furthermore, the hearings and investigations that subcommittees conduct present opportunities for potential embarrassment of bureaucratic officials. Bureaucrats who are concerned about their professional reputations will likely want to develop a favorable relationship with the subcommittee that oversees them in order to minimize the chances of experiencing public embarrassment or criticism from the subcommittee.

The third actor in the iron triangle is the bureaucracy. As they make decisions, bureaucrats may be motivated by a combination of various factors such as organizational pressures, personal values (including a desire to serve the public), and professional norms. The selection of bureaucrats to fill positions in a bureaucracy can influence how that bureaucracy behaves. For example, a bureaucracy that fills positions using a patronage system will likely make decisions more in line with the political values of the lead executive (or whoever has appointed them) than a bureaucracy operating in a civil service system. Bureaucracies that hire individuals belonging to strong professions would be expected to make policy decisions that usually align with the values and ethical standards of those professions.

Just as industry profits often motivate interest group behavior and as reelection concerns can drive elected officials' actions, self-interest can affect how bureaucracies navigate their surrounding political environment. Individual bureaucrats may be motivated by career concerns, including

opportunities for promotion or job security. At an organizational level, the incentives employees within the bureaucracy face with regard to promotion or other desirable career outcomes can affect policy decisions. If individuals are rewarded for taking risks, risky policies are more likely to be adopted. If bureaucrats have strong job security, they may be more willing to pursue unpopular policy positions. Collectively, a bureaucracy is expected to be motivated by a desire for greater autonomy and resources.

In order for a bureaucracy to gain autonomy and resources, it will need support from the other actors in the policy subsystem. As such, the bureaucracy must actively engage with these other actors to achieve its own interests. The political power of individual bureaucracies can vary considerably depending on factors such as their knowledge, cohesion, and leadership (Meier and Bohte 2007; Rourke 1969). A bureaucracy with multiple political principals (e.g., an executive power, a legislature, and a court system) may be able to strategically play the principals off one another or strategically align itself with one to advance its own preferred policies. Or a bureaucracy may turn to interest groups, relying on their backing to strengthen their appeal for resources or changes in legislation. Selznick's (1949) classic work on the Tennessee Valley Authority (TVA) clearly illustrates the manner in which bureaucracies can function as political actors in their broader environment. The TVA adopted a set of policy positions in order to retain support from specific interest groups who could help the TVA ensure sufficient political will to pursue certain policy goals that were of interest to the bureaucracy.

## Democracy and Accountability for the Bureaucracy

Within a democracy, the role unelected bureaucrats play in making important political decisions is potentially problematic from the standpoint of accountability. Issues of democratic accountability within the bureaucracy have been approached using two broad perspectives. The first perspective assumes that bureaucracies uphold democratic norms when they enact policy that is consistent with the wishes of elected officials. Since bureaucrats are able to exercise discretion and elected officials are not able to perfectly observe all actions of bureaucrats, bureaucratic activity will not perfectly conform to the will of elected officials.

Nonetheless, multiple mechanisms might push bureaucratic activity toward alignment with the wishes of elected officials. Specifically, several blunt tools enable elected officials to exercise a measure of control over implementation. Elected officials often conduct reviews of bureaucratic policies – as in US Congressional committee hearings – which provide opportunities to gain information about what a bureaucracy is doing, to communicate what elected officials want from the bureaucracy, and to publicly embarrass or praise bureaucratic officials for what their organization is doing. Political actors can also manipulate a bureaucracy's personnel makeup through rules or political appointments, manipulate funding to punish or reward bureaucracies, and strategically adopt administrative procedures such as requirements for public comment periods before bureaucracies impose new regulatory rules (McCubbins et al. 1989). In some cases, there may be multiple government agencies that could reasonably be tasked with implementing a given policy, and elected officials may choose whatever agency has norms or expertise most consistent with the desired policy objectives. Or a new agency might even be created to implement the policy.

Another reason that bureaucracies might enact policies consistent with the wishes of elected officials is that members of the bureaucracy might voluntarily defer to elected officials, perhaps as a result of bureaucratic norms regarding administrative responsibility (Finer 1941). Bureaucrats may believe that they have a moral or social obligation to defer to elected officials with regard to the values and priorities that direct the bureaucracy's activities. Even if some individual bureaucrats do not personally hold this conviction, broader organizational norms might form that encourage all employees to act out of deference to elected officials.

Whether examined through the lens of voluntary submission or top-down control, works adopting this first broad perspective often emphasize (sometimes implicitly) bureaucratic alignment with elected officials' preferences as a means of furthering democratic ideals. A major challenge to this perspective is that elected officials do not always direct bureaucracies to act in a manner that is consistent with the will of the electorate. Procedures that make it easier for the public to observe what goes on within a bureaucracy may mitigate this concern by facilitating the public's ability to hold elected officials responsible for how they oversee bureaucratic activity (Wood and Waterman 1994).

A second strand of scholarship adopts a perspective which assumes that bureaucracies can carry out policy decisions that are consistent with democratic norms independent of submission to elected officials (Gruber 1987). A policy created by unelected officials might derive a democratic character from the bureaucracy's direct responsiveness to public policy preferences. If individuals within a bureaucracy care about public perceptions of the bureaucracy, they might have an incentive to respond directly to public opinion, particularly on issues that garner substantial public attention. Greater transparency regarding bureaucratic activities may facilitate accountability by allowing the public more opportunity to evaluate and express concerns about political decisions made within the bureaucracy. In some cases, complaints or public demonstrations might alert bureaucrats to public sentiments and compel them to act in a particular manner. Some interest groups may pressure bureaucracies to adopt policy positions that align with the broader will of the public. Bureaucracies can also formally engage the public through practices such as participatory budgeting, solicitation of public comments, or citizen surveys.

Some scholars have argued that it is possible for unelected bureaucrats themselves to serve as representatives of the people in some sense. Representative bureaucracy theory suggests that a bureaucracy with personnel who demographically mirror the public will tend to make decisions that account for broad public interests. Under this theory, individual bureaucrats are seen as representatives of members of the public who share one or more demographic characteristics. Whether bureaucrats actually act in a manner that serves to benefit members of the public who share their own demographic characteristics appears to depend on multiple factors, such as the organizational environment and the salience of a given demographic characteristic to the policy area in which the bureaucrats work.

## Conclusion

Bureaucracies play an important role in politics. Without them, government as we know it could not function. Yet bureaucracies occupy a somewhat unusual space in democratic governments given that they operate with the force of government but are run mostly by officials who were not elected to office. The manner in which bureaucracies intersect with political conflicts constitutes an important topic of study both for students of political systems and for students of public administration. Without looking at the bureaucracy, one cannot know how political decisions will actually be implemented on the ground. And without considering politics, it is impossible to fully evaluate the implications of bureaucratic functioning for society. Bureaucratic politics is not easy to study or measure, but several important insights can be taken from existing work on the topic. First, the outcomes of policy programs often depend on who is hired to implement the programs. Second, institutions that dictate relationships among bureaucrats, interest groups, and legislatures will affect policy decision-making in significant ways. Third, personnel policies that change the incentives of bureaucrats can affect how bureaucrats make political decisions. Fourth, the accountability of bureaucracies to more traditional political actors is limited; specific structures that enhance transparency or facilitate direct accountability of bureaucracies to the public may mitigate such concerns. Finally, bureaucracies may have to resolve big political conflicts when other political institutions neglect to do so; legislatures and heads of government that are unable or unwilling to resolve aspects of key political conflicts

sometimes give vague mandates to bureaucracies that require them to act without clear political direction. If bureaucracies lack the level of legitimacy that other political institutions enjoy, it may be beneficial to create structures that encourage more traditional policy making institutions to more fully resolve political conflicts.

Civic engagement; Comanagement; Cooperation; Public participation; Stakeholder partnership

## Introduction

For many, the word "collaboration" probably conjures some image of multiple parties working together to achieve some mutually desired end, a shared effort to achieve a goal in which each party has a shared stake. Indeed, this is largely consistent with what we talk about when we discuss collaboration in the context of public administration and public policy. Very broadly speaking, in public management, policymaking, and governance, collaboration is often used as a tool for organizing the efforts of multiple groups or individuals working together in a manner that is typically cooperative and deliberative, as opposed to adversarial and hierarchical. Choosing the exact terminology here can be problematic because there are so many different terms that have been used in the literature to describe collaboration in the context of governing. Common terms represented in the literature might include, collaborative governance/management, networked government/management, comanagement, cooperative federalism, negotiated regulation (RegNeg), stakeholder partnership, participatory governance, civic engagement, and others too numerous to name here.

Similarly, there are as many theoretical frameworks for defining and explaining the dynamics of collaboration as there are unique terms. Thus it would not be possible, or even useful, to recapitulate all of these varied frameworks here. With that in mind, this entry will focus on a very broad survey of the diverse ways in which collaboration is constructed in practice and in scholarship, drawing from a few of the most common models in the literature, and distilling them into a broad framework that will serve as a basic introduction to the topic while providing some possible directions for further reading for those who wish to gain a deeper understanding.

The next section outlines the background of collaboration in public administration and policy, situating it within the broader context of the tension between bureaucracy and democracy, highlighting the proliferation of collaboration in the literature over the past few decades and briefly introducing the theoretical frameworks that produced this movement, as well as the movement's

underpinnings in democratic theory. That section will be followed by one that explores the structure and dynamics of collaborative frameworks, focusing on questions related to who participates and how decisions are made.

## Background and Basic Framework of Collaboration in Politics

Collaborative governance, policymaking, and management have proliferated in both the practice and scholarship of public administration over the past 20–30 years. Indeed, many argue that collaboration constitutes the new paradigm in democratic governance, particularly regarding regulatory policymaking, pointing to claims that collaboration has greater democratic legitimacy than the top-down, command-and-control alternatives. This is certainly true in particular policy subsystems, such as endangered species habitat management, which is now done almost entirely through collaborative partnerships between the federal government, state and local governments, private land owners, and conservation interest groups. The classic command-and-control style of regulating issues such as environmental and natural resources policy has long caused consternation among scholars and practitioners concerned about the consequences for democracy of unelected administrators exerting influence over matters of public policy (see, for example, Wilson 1991). At the core of collaborative concepts is the goal of uniting diverse groups of stakeholders – sometimes from historically opposing interests – to make public policy or manage public programs and resources in a way that is more cooperative and less coercive than traditional top-down command-and-control approaches through deliberative consensus building. The collaborative approach is frequently employed in an attempt to solve "wicked problems." Rittel and Webber (1973) coined this term to describe their view that nearly all social problems are inherently different from scientific or technical problems and thus cannot be solved in the same ways. Wicked problems are those that can neither be neatly defined nor objectively solved. In contrast to "tame problems," such as mathematical equations and engineering tasks, public policy problems are subject to multiple definitions and interpretations by multiple interested parties, making the identification of objectively correct resolutions impossible.

The nature of these types of thorny, complex problems in which varied interests are involved is that they frequently result in stalemate between the interested parties. In environmental and natural resources problems, for example, the result is frequently a prisoner's dilemma, or a scenario in which perverse incentives to overuse or fail to protect the resource prevail. Garrett Hardin (1968) famously decried the resultant depletion of resources as the "tragedy of the commons." He illustrated this point with an example of a common grazing field on which a group of local shepherds graze their sheep. Each shepherd is allowed to graze a particular number of sheep on the commons, and if each farmer complies with this agreement, the commons will be sustainable. However, without monitoring and strict enforcement, each shepherd has an incentive to graze additional sheep so long as she believes she will not be caught and punished. The result is that all of the farmers overgraze the commons and it is quickly destroyed, rendering it useless. Hardin, and contemporaries such as William Ophuls (1977), argued that the only means for preventing the tragedy of the commons was for central governments to implement rigid, top-down resource use regimes and to enforce them with their monopolies on the use of force. Implicit in these arguments are assumptions about human nature that have their roots in early modern political thought, particularly the social contract theory that emerged from the work of the English philosopher Thomas Hobbes, who argued that strong central sovereign authority is essential to avoiding perpetual violent conflict.

However, more recent influential work in political science and economics has challenged these assumptions by showing that there are alternative methods of breaking the stalemate of the prisoner's dilemma that do not rely – or do not rely directly – on central authority. This work, which proceeds from two major theoretical frameworks

in political science, has been the impetus for the collaborative revolution in public policy, administration, and management. First, Elinor Ostrom challenged Hardin in her influential book, *Governing the Commons* (1990), in which she argues and shows empirically that when small groups of users of common pool resources – such as Hardin's grazing commons – communicate, deliberate, and make credible commitments, they can form self-enforced agreements that manage the resource sustainably in everyone's best interest, without resorting to the necessity of the state to maintain order through threat of force. This work resulted in a theoretical framework that is used to analyze the structures and rules of the institutions that such agreements produce. This Institutional Analysis and Development (IAD) framework has served as the basis for much of the theory on stakeholder collaboration. For a more thorough review of the IAD framework, readers might refer to Ostrom (2007).

The other body of theory in which much of collaborative theory is based is the Advocacy Coalition Framework (ACF) developed by Sabatier and Jenkins-Smith (1993), which explains policy change over long periods of time as a process of learning and as a negotiated process among varied stakeholders inside a policy subsystem. ACF theory, particularly its components that have most heavily influenced scholarship on collaboration, is deeply rooted in the literature on alternative dispute resolution. One of its core elements is the idea of getting away from the idea that any dispute between opposing stakeholders is a zero-sum game, in which one player's gain necessarily comes at the loss of the other.

While these two main frameworks have guided much of the empirical work that has been done on collaboration, the popularity of collaborative governance also grows out of the deliberative democracy movement in political theory (e.g., Sabel et al. 1999). Again this harkens to apprehension over the power of the bureaucracy in democratic governance and an effort to build democratic legitimacy into the process. For deliberative democrats, opportunities for citizens and stakeholders to participate in the process of governing in a way in which all reasonable voices are heard and no one individual or group dominates the process comprises the cornerstone of democratic legitimacy (see, for example, Dryzek 2000; Fishkin 1991). Collaboration, with its deliberative, participatory component, meets this criterion for these advocates of deliberative democracy. Where collaborative theory is influenced by more general democratic theory, however, it places an emphasis on the outcomes of collaboration and is critical of an approach that focuses on consensus as a goal in itself. It is also worth noting, however, that collaboration became popular amid the early 1980s conservative backlash and the Reagan era of American conservatism. As Layzer (2012) points out, American conservatives define themselves in opposition to the government intervention in markets that characterizes New Deal liberalism, preferring instead to align themselves with neoliberal principles that emphasize market-based solutions to public problems.

While collaboration has been most studied, and perhaps most used, in the setting of environmental policymaking and administration, such as local watershed management and other natural resources issues (e.g., Heikkila and Gerlak 2005; Leach et al. 2002; Lubell 2004; Thomas 2003), it has also been studied in many other substantive contexts. Agranoff and McGuire (2003) study public-private collaboration over local and regional economic planning. Nicholson-Crotty and O'Toole (2004) study the use of interagency collaboration in law enforcement. Provan and Milward (1995) study local and regional collaborative networks for the provision of mental health services. And these are just a few examples selected to illustrate the diversity of the policy arenas in which collaboration has been both used as a practical tool and analyzed by public administration and policy scholars.

## The Structure of Collaboration: Who Participates and How?

Who participates in a collaborative governance endeavor varies greatly depending upon the context of the particular arrangement. In fact, some scholars of collaboration even define collaborative

governance in ways that are contingent upon who is participating or who initiates the collaboration. For some (i.e., Ansell and Gash 2008), collaborative governance exists when one or more governments – or government agencies – engage with one or more nonstate stakeholders in an effort to make policy or manage public goods. By contrast, others (i.e., Emerson et al. 2011) do not make assumptions about who initiates the collaboration or who participates, instead articulating a much broader definition that might include nearly any combination of public and/or private parties.

In addition to variation in the composition of collaborative governance endeavors, there is also a great deal of variation in the structure of collaborative arrangements. This variation can be seen in the level of formality of the connections between various actors, the level of institutionalization that binds the actors together, and the level of formality of the outcomes. In some cases, the goal is to produce a decision that will have the force of law. In other cases, the outcome might be a legally binding contract between the involved parties. Alternatively, sometimes the agreement might be much less formal, backed by little more than a handshake, mutual trust, and perhaps some self-monitoring and self-enforcement mechanisms. Stakeholder collaboration in practice ranges from very informal collectives of interested parties coming together, as in a local watershed partnership or irrigation cooperative, to highly formal and institutionalized partnerships between federal agencies, state and local agencies, and various interest groups, such as in habitat conservation planning under the Endangered Species Act. With this kind of diversity in collaboration, it is easy to see why the field has struggled to produce one, integrative framework that explains it in all its forms.

However, one common element between nearly all collaborative governance endeavors is an agreement among stakeholders that the status quo is no longer tenable and that multiple perspectives must be taken into account in determining a solution in order to move beyond adversarial processes and produce an outcome that is acceptable to all relevant parties. This desire to set aside antagonistic relationships in order to build consensus incentivizes groups to compromise and make concessions in order to build consensus because one dissatisfied party can choose to affect the process from the outside by bringing litigation against the other parties. This is why the alternative dispute resolution (ADR) movement, which was built on the concept of resolving conflicts through mediation, has been so influential in the study and practice of collaboration (see Emerson et al. 2003).

Therefore, like any other attempt at policy change, attempts at collaborative governance begin with a problem, debates and negotiations over the definition of the problem, and a consensus that a change from the status quo is necessary, even if not all parties initially agree on what form that change should take. The next stage in the process is typically to identify all relevant stakeholders and invite them to participate in the collaboration. There are, of course, a few practical concerns here. First, there are practical limits to the number of individuals and groups that can effectively negotiate together. It is easy to imagine, for example, that there might be literally hundreds of individuals and groups that might wish to have a say in the crafting of something like a regional habitat conservation plan that will have important implications for the preferences of all sorts of people and groups, including local governments, conservationists and nature lovers, individual landowners, construction firms and other contractors, realtors, public interest advocates across the political spectrum, scientists, educators, and countless others. It is easy to see that a negotiation process among this many varied stakeholders could quickly become unwieldy and collapse under its own weight. For this reason, in practice individuals and groups are often chosen as representatives of broader interests, much in the same way that elected officials are chosen to represent the interests of larger constituencies. However, often in these situations efforts are made to ensure that all relevant interests are represented, for fear that a dissatisfied group that feels its voice was not heard might bring litigation against the final decision.

This of course comes with one important caveat. Groups and individuals deemed to be

unreasonable are frequently intentionally sidelined. If a group is perceived as being unwilling to compromise or as making unreasonable demands, its participation will likely not be invited. One of the driving forces that is frequently listed as an important determinant of collaboration in analyses in the literature is the history of the relationships between the actors, which of course is a leading factor determining the level of mutual trust between them. Trust has been theorized to be one of the most important variables in fostering an environment in which successful collaboration can take place (e.g., Heikkila and Gerlak 2005; Lubell 2004). In addition to historical relationships between actors, other factors also determine this level of trust, such as norms of consensus, beliefs that the process is fair, and a belief that a failure to cooperate would result in mutual stalemate (Leach and Sabatier 2005). So, groups and individuals join a collaborative effort when there is some baseline of trust that the other parties are negotiating in good faith, that the process will be fair, and that their voices will be heard, and those who are perceived as not being able to live up to these requirements are frequently left out.

Another important component of collaboration that has received a great deal of attention is the role of scientific information in defining problems and evaluating alternatives (Heikkila and Gerlak 2005). In order to solve any policy problem one must first understand its causes. Similarly, in order to weigh alternatives for action one first needs to understand their effects. Scientific data thus constitute an integral part of any policy or management decision. The role of science features particularly prominently in studies of collaboration because one of the chief complaints about the classical regulatory approach leading to the proliferation of collaborative alternatives was that it lacks the flexibility to incorporate ecosystem-specific scientific data into the policymaking and management processes. Scholars of collaboration have shown that scientific information spurs policy action through increasing concurrence on problem salience (Heikkila and Gerlak 2005). In other words, good technical information helps stakeholder partners broadly agree on the importance of the problem at hand.

## Conclusion

Collaboration has been an important tool for solving difficult social and political problems over the past few decades. Going forward into the future, its usage is likely to increase and broaden as more public and private stakeholders in all policy arenas seek new options for breaking old policy stalemates and solving new and increasingly complex problems. Collaboration can often be a useful tool for bringing varied interests together to work cooperatively and deliberatively to come up with solutions to problems on which the same parties have historically disagreed.

In the literature on collaboration in public administration and policy one will find dozens of different very specific definitions of collaboration and other terms meant to connote collaboration. One will find as many frameworks for describing how collaboration emerges and how the internal dynamics of a collaboration work. Covering all of these in any detail would be beyond the scope of this brief entry. Thus this entry has provided a brief introduction to the concept of collaboration and how it has been applied to public policy and administration problems. Ultimately, in the broadest sense, collaboration in this context is what occurs when multiple individuals or groups from various perspectives come together in a process that is deliberative, in which everyone has a voice and no one group or individual is dominant, and which seeks to find a consensus solution that all can live with. There are various forms that this might take in practice, ranging from very informal to highly formalized and legalistic. And there are sometimes limits placed on who is invited to participate and at what level. Who is invited to participate will be determined by multiple factors, including who might take legal issue with the final decision, historical relationships and mutual trust between parties, perceived levels of reasonableness of an individual or group's demands, and efforts to appoint certain groups or individuals as representatives of a broader constituency with similar interests. Participants then deliberate and debate about the problem, possible alternatives for solving the problem, and the interpretation of scientific and technical data. For further reading

on collaboration, or for a deeper treatment of any particular theoretical framework of collaboration, the reference list below would be a useful place to begin.

# Politics and Crisis Management

Neal Turpin
University of Louisville, Louisville, KY, USA

## Synonyms

Administration; Democracy; Government

## Definition

Crisis management is the process by which a government agency works to avoid crises or

events which may be harmful to the organization or to the public at large and works to mitigate the effects of any crises which may occur.

## Introduction

When crises occur, it is natural for citizens to look to political leaders to help solve the issues quickly and effectively. When disaster strikes, governments often have tools and resources available that most other organizations or individuals do not, and we like to think that the government will be there for a community in its time of need. The government is the best way to solve issues that require collective action, including managing a crisis situation. When something goes wrong, governments can do more to solve the problem than any other entity. However, this process is not always as simple as it may seem, and any action taken by a government in response to a crisis has to be viewed through a political lens.

Any form of crisis, whether it is economic, military, or environmental, can have political ramifications. Because of this, any situation has the potential to be used for political gain and can cause political actors to make decisions that may have as much to do with political concerns as they do with the public good. There is a theoretical aversion to this line of thinking, rooted in the idea of a dichotomy between politics and administration. When a natural disaster occurs, most people would like to imagine that politics will take a back seat to resolving the crisis quickly and safely. After all, when a tornado hits a town, there is not a Republican or Democratic way to rescue people trapped under debris. However, this mindset drastically underestimates the desire for political actors to maintain control.

## Political Ramifications of Crises

A crisis can rapidly define or redefine a politician's image. Handling it well can instantly improve one's reputation, elevate a leader in the eyes of citizens, and potentially lead to more power or a higher office. Following the incident at the Three Mile Island Nuclear Station, Pennsylvania Governor Dick Thornburgh's approval rating skyrocketed. He was seen as having stayed calm, effectively leading emergency management operations, and raising money for cleanup efforts (Fink 1986). After the attacks on September 11th, President George Bush's approval ratings topped 90% due to his reaction to the disaster. John F. Kennedy came across as an international power player for his handling of the Cuban Missile Crisis. These leaders gave the appearance of stability to an uncertain public, and they benefitted politically because of it.

On the other hand, poor handling of a crisis can derail a politician's career. For example, a poor response to the 1969 Blizzard in New York by Mayor John Lindsay is commonly thought to have hurt his career and crippled his 1972 presidential bid. George W. Bush's administration suffered greatly from its bungled response to Hurricane Katrina. Because mishandling a crisis can have such negative effects, politicians have a great incentive to make sure contingency plans are in order and the public sees them as being prepared for whatever crisis may come up.

But leaders do not only have to concern themselves with the public's reaction. While citizens look to leaders to help solve crises, political opponents look to capitalize on them (Boin and 't Hart 2003). Crises can show the need for reform or improvement in a government organization, which can imply that the status quo is problematic. In a crisis, opponents can blame current leaders for any issues that have arisen during their tenure. This can make those in power look inept and put forth the opposition as ones who can solve or prevent future problems. If a current leader has issues that led to a crisis, a new leader may be required to come in and clean house. Because of the level of blame ready to be heaped upon those in power, it requires not just a ready response after a crisis has occurred, but enough preventative measures to show that officials were not caught off guard and had done everything possible to mitigate the effects.

## All Crises Are Political

There are many types of crises that can affect a society. Some of these are inherently political in nature. When a corrupt politician mishandles public funds or when political pressures result in innocent people being arrested, there is very clearly a political connection and political outcomes. Political scandals and corruption, while not always life threatening, are crises nonetheless. They can result in a breakdown of the system of government, causing other functions to suffer. Political issues must be managed in order that political structures do not collapse.

Throughout history, political crises have resulted in dramatic changes to the way people are governed. The Watergate scandal, for instance, was a fundamentally political crisis. No lives were ever at risk, yet it led to the resignation of both the president and vice president and caused an unprecedented lack of trust in the government. In the 1780s, Shays' Rebellion highlighted problems with the Articles of Confederation and showed the need for the Constitution. In the 1800s, a nationwide system of corrupt party bosses in cities helped to usher in the Progressive Era.

Other types of crises, though not fundamentally political in nature, still have major political implications. Economic crises are not strictly political in nature. Often they result from private action, a change in consumer preference, or simply a bad year for a crop. Still, politicians are typically held accountable. When campaigns promise jobs and economic growth, it is damaging when those things don't happen. Inflation rates, interest rates, growth rates, tax rates, and unemployment rates are all political issues. Rising unemployment can be a sign that a party's economic policies are misguided and could hurt them on election day, whereas broadly felt economic growth can solidify a politician's or party's hold on political power.

Many environmental crises have direct political causes and effects. How to handle climate change, for example, is a contentious issue. Though the issue itself is firmly rooted in science, dealing with it places it squarely in the political arena. Some would argue that the government should regulate certain industries or products or that taxes be used as a deterrent force. Measuring economic concerns against environmental concerns is a value decision common in the realm of politics. When natural disasters strike, elected leaders are often measured on the quality of their response, as well as what measures were in place beforehand. Were tornado sirens functional? Were shelters well supplied? How coordinated was the response by emergency workers?

Infrastructure problems are another source of political crises. The 2007 collapse of a bridge in Minneapolis and the ongoing water crisis in Flint, Michigan had serious political implications. Political blame abounded over who was responsible for funding, inspecting, and maintaining these systems.

Often multiple types of crises can combine to form a much larger crisis. Hurricane Katrina is a prime example. The storm caused infrastructure to fail and led to the flooding of New Orleans. The government's disastrous response further compounded the issue, which not only resulted in the deaths of hundreds in New Orleans alone, but was politically devastating to the Bush administration.

## Crisis Avoidance for Politicians

To a large extent, avoiding crises means taking steps toward preparation and maintenance of current systems. Inspecting flood walls, running drills, and doing routine infrastructure repairs can greatly reduce the damage inflicted by an environmental- or infrastructure-based crisis. Smart tax and finance policies and attracting a diverse yet stable employment base can safeguard a region against economic crises.

Politicians (executives and legislators alike) should concern themselves with crisis avoidance procedures. If a congressional oversight committee misses key warning signs, it could be disastrous both to those affected and to the legislators themselves. If an executive is not prepared when a crisis hits, they can lose political capital instantly.

Avoiding crises seems like a goal all politicians could get behind. However, this is often not the

case. Differing political views can create values conflicts. Various ideologies may support funding to avoid a natural disaster or a military crisis. Some may see infectious diseases as an issue that needs to be addressed quickly, while others would prefer to focus on averting an economic crisis. While avoiding a crisis may be theoretically desired, debating which crises are seen as the most pressing often results in heated battle for funding, resources, or political attention.

When leaders do have the ability to plan for a crisis, it is important that they do so in the right way. Irving Janis (1983, 1989) discusses heavily the processes by which leaders make their decisions. Leaders who have oversimplified views of a crisis situation or the potential for a crisis situation may make bad choices. Leaders may make impulsive or emotionally based decisions, which often do not work out. Leaders may succumb to social pressure in pursuing a specific policy when evidence and expertise indicate another route should be taken.

Groups are the usual way to counteract the limits of an individual. Having a panel of experts or a brain trust can show the willingness of a politician to accept help and advice and is usually positive. Many decisions are too important to mess up, and more ideas and points of view can add value to a discussion and be the difference between a good outcome and a negative one. But groups also have their shortcomings, including a lack of vigilance, an overestimation of the group's power or morality, and a pressure toward uniformity. Having a panel of "yes-men" is as likely to do more harm than good. Politicians need advisors who are willing to tell the truth, even if it conflicts with the opinions of the rest of the group or its leader.

But even leaders who are open minded can fall victim to faulty intelligence or just plain bad luck. A storm that intensifies despite all available weather forecasts can wreak havoc. Unexpected turmoil overseas can send domestic markets tumbling. Even with the best efforts of political leaders, crises can still occur.

Constant tests, drills, and training sessions are vital to ensuring that a response is effective. They also protect politicians from charges of negligence in the event of a crisis. Before a crisis, these steps may seem like a waste of time or an annoyance. The noise involved in testing civil defense sirens and emergency alert systems may frustrate the public, but the danger of them not functioning properly is much greater. In addition, knowing that preventative steps are being taken can calm the nerves of the public. If snow is in the forecast, seeing that roads are being pretreated can prevent a rush to the grocery for food.

However, while preparation is important, these actions are not at all glamorous politically. It is much more politically beneficial for a politician to dedicate a new bridge than to maintain an old one so it doesn't collapse. When politicians leave office, they often point to visible accomplishments. Improving a city's infrastructure rating is rarely noticed, but perhaps more important. And few citizens will remember if a crisis didn't happen. People will not look back fondly on the economy not collapsing or a flood being averted. This may be why many areas are unprepared and so much infrastructure is in such bad condition.

## Political Action During a Crisis

Even if every possible step has been taken to avoid a crisis, they will still occur. When a crisis happens, how a politician handles it can not only determine their political future but also determine how extensive the damage from the crisis becomes. To begin, political leaders must first decide if something is a crisis or simply an isolated, temporary, or small-scale event. Not every snow storm or market fluctuation represents a full-blown crisis, and responding to every event as if it were can strain resources and leave people with a false sense of security when a real crisis occurs. This decision must be made quickly, however. A delayed response can be disastrous and make politicians look unprepared, unobservant, weak, or scared to act.

Leaders must also communicate with citizens honestly without leading to panic. Showing that government agencies are prepared to handle a situation can prevent a small crisis from turning

into a full-blown emergency. Government responsiveness and communication should be shown before, during, and after a crisis has occurred.

One of the most important things a politician can do is to be involved. When leaders are on the front line, coordinating responses, and working with other agencies, it will drastically improve the impression that citizens have of them. Being involved shows that political leaders care and that they understand or even share in the suffering of the community. Politicians who are not involved run the risk of appearing indifferent, which can weaken their standing in the community and give support to political opponents in subsequent elections. Leaders should not get in the way, however, unless of course a politician is a trained emergency responder.

Politicians should also be aware that no emergency plan will ever be totally sufficient for a crisis. There will always be unforeseen circumstances which will require some degree of flexibility. Having alternate routes for emergency vehicles to travel after a tornado or having a rainy day fund for unexpected expenses can give a plan just enough adaptability to handle a problem.

In a crisis, it may be difficult for one person to take charge completely because issues are now so complex. Politicians must be able to work together to solve a problem. While this sounds straightforward enough, political considerations often prevent opposing politicians or political parties from effectively cooperating. Deciding who will receive credit can not only result in bickering between parties but slow down any response, needlessly drawing out a crisis situation. While political concerns may motivate leaders to act quickly, those same concerns may prevent leaders from acting together.

## Political Concerns After a Crisis

In a political context, what happens after a crisis can be as relevant as what happens during one. There can be much to learn from a crisis, and learning what went wrong can lead to improvements and better outcomes in the future. Still, many difficult questions must be answered. What crisis prevention mechanisms worked well? Which ones did not? Were there warning signs missed? Was this a system breakdown, human error, or simply bad luck? While these questions are important for all involved, they are of particular concern for politicians, who are likely to deal with accusations and blame from political opponents. Following large crises, there are likely to be official investigations or hearings. Figuring out what happened and why can help deflect blame and serve as a potent political defense.

It is likely the case that due to an increasingly complex set of systems, breakdowns in several different areas contributed to a crisis. In this case, improvements in coordination are often advocated. This can create new political structures and introduce new concerns about funding and oversight. For example, the Department of Homeland Security was created in response to the attacks on September 11th due to a lack of coordination and communication among various government agencies. While many felt this was necessary to prevent future attacks, others raised concerns over citizens' privacy and the cost-effectiveness of some measures.

Crises can also present opportunities to propose new policies that may otherwise have not had enough support to be politically viable. An oil crisis can lead to new calls for investment in alternative sources of energy. An economic crisis can lead to new regulations to safeguard against future problems. The Great Depression, for example, resulted in several New Deal policies which may never have been passed had the crisis not occurred.

## Political Ethics and Accountability

Politically, results matter. Whether or not crises are prepared for and handled effectively is important for everyone involved. The end result of crises, however, may not be the only consideration. The means in which crises are handled and resolved matter a great deal.

To begin, political leaders must be seen as legitimate (Stark 2010). Having representative structures in place can help with this, showing that while leaders are in charge of dealing with a situation directly, they are still held accountable by citizens for their actions and for how they handled the crisis. Keeping people accountable is important, as it ensures that the public will and public good are at the forefront of politicians' minds. When there is no one to hold accountable for how a situation unfolds, the public usually suffers. The water crisis in Flint, Michigan is a prime example. Many of the decisions that led to the crisis were made by emergency managers appointed by the governor – unelected officials who are unaccountable to voters. These decisions resulted in thousands of children being poisoned with no one to hold directly accountable. While appointing unelected officials may appear apolitical, the decision to use such methods is heavily politicized. A basic tenet of democracy holds that people should have some say in how they are governed – in the decisions that affect their lives. By removing this democratic feature, political accountability was also removed, changing the political landscape of Flint's local government.

Beyond political accountability and technical concerns are ethical considerations (Svedin 2011). Even if the government's response to a crisis is flawlessly carried out, if the action is seen to be unethical, the reaction by citizens can be negative, and mishandling the response can result in a real lack of faith in leaders. Deciding what is ethical is often hard to determine. For example, can going to war be considered ethical? Should the government force people to evacuate their homes in a flood? Forcible removal of residents is generally seen in a negative light, but if doing so keeps people alive and prevents the need for dangerous and costly rescue efforts, people may be more willing to accept it. These sorts of ethical questions are important. Politicians need to be seen as holding the moral high ground. People generally understand that hard choices have to be made by those in charge and are often willing to extend political forgiveness to those presented with such difficult decisions. However, when a politician is selfish or deceitful in the decision-making process, or when they stick to a rigid ideological structure even when it is impractical and harms citizens, voters may not be as understanding. Citizens expect their political leaders to make the right decisions and to make them in the best possible way.

## Conclusion

The handling of a crisis by a government is full of political concerns. A politician's responses before, during, and after a crisis can make or break a career. Citizens expect their leaders to take necessary preventative action and to take steps to mitigate the damage. Proper communication and involvement are vital. In addition, politicians must handle these situations in an ethical fashion. Crises are much more complicated than the crisis itself. The stakes involved for citizens and communities make them inherently political, and they must be handled as such.

In the popular imaginary, politics and ethics seem to be an oxymoron for all too many around the world. Cynicism, bias, partiality, and reckless passion may rule, squeezing out ethical considerations. Global polling shows that politics and politicians are often seen as selfish and corrupt power-players, defending special interests. Problems abound as humanity is exhausting the carrying capacity of the planet. Examples of the disregard for human ethics are evident in the widespread proliferation of military weapons, the lingering implementation of the death penalty, and the sometimes willful neglect of public services. Safeguards incentivizing corporate responsibility have been removed in the few places where they existed ushering in an era of rash and widespread monetization of public goods. Without trust in, and respect for, politics and politicians, the vitality for living together in democratic communities leaches out, and societies that are populist, fascist, or dictatorial can take root. This essay examines the fundamental premises of politics, the emergence of ethical considerations, and the thinking of modern theorists focusing on twenty-first century political ethics. To understand the deeply serious role of ethics, we need to understand the role of politics.

Formally or constitutionally, politics consists of five basic issues. First, because humanity clusters within states, the populous develops relationships with one another as citizens. This is the choice between equality and inequality. Second, functions are allocated to the state with the potential to be all encompassing or severely limited. This is the choice between a pluralist and a monistic state. Third, the state must have the authority/power to carry out its functions. The license originates with the state itself or with the citizenry. This is the choice between freedom and dictatorship. Fourth, the organization of the exercise of state power allows authority to be concentrated or dispersed. This is the choice between either a dispersion or a unification of powers. And, fifth, the magnitude of the state and its external relations vis-à-vis the governed population means there is a choice between a multitude of states and a universal state.

Lipson recognizes, as did Aristotle, that the state is a wholly human contrivance making it a form of self-analysis eliminating any possibility for complete detachment. To make sense of the chaos, politics has to be interpreted. This subjective feat allows each person to play the tripartite role of spectator, critic, and actor. Stone sees politics converging with policy to keep society together in a polis. Communities exercise collective will and apply collective efforts. The inevitably of conflict between and among citizens revolves around questions such as who is included and whether the goals are cooperative, consensus driven, or conflictual.

Politics are then the essential activity or master science which builds societies and communities premised on rules, laws, and a balance of conflicting interests. The human need for protection provided by organized force leads to the formation of communities and the monopolization of force by governments capable of controlling internal and external threats. States advanced from protection and order to justice and the good life. These advances can be contradictory and are of no small moment because, as Lipson pointed out, Hitler outdid Attila and a future tyrant could outdo him.

The body of ethical/moral values, virtues and visions, converge on the democratic ideal of the common good. Politics require a high level of responsibility and commitment from citizens, political parties, elected officials, government executives, the judiciary, the media, business, nongovernmental organizations, and religious and educational institutions. The world's people

are calling for greater transparency resting on the recognition that democratic accountability requires public officials not only to act in the public interest but also to reveal their processes.

Overtime societies developed functional bodies of obligations and duties required of its members. We know this as ethics. Sometimes individuals are encouraged to reflect on the intentions and consequences of their actions leading to the development of theories of conscience. Whether ethical sensibilities are innate, as postulated by Rousseau, or a power of discrimination acquired by experience as Mill contended, they all address ethical responsibility in politics. A canvass of the world's political traditions carried out by Girardin reveals a global demand for a just politics. Although the relationship between politics and ethics oscillates between close alignment and almost complete mutual exclusiveness, thoughtful theorists have emerged whose contributions substantially delineate the link between politics and ethics.

All societies embrace difference and diversity because no two human beings are alike and desired resources are usually circumscribed. When divisions proliferate, competing perceptions and varying needs demand alternative outcomes. American, James Madison, recognized this when drawing up the US Constitution in the late 1700s. He saw "factions" as agents of disorganization violating the potential harmony imposed by the umbrella of the state. He did not imagine that they may be valuable contributors to a broader debate.

Public officials are larger than life in representative democracies, empowered to act on behalf of everyone in society. They assume rights and have obligations to a degree that surpasses those of ordinary citizens. Their duties may call for forceful transgressions, lying, keeping secrets, and breaking promises that would be wrong in private life. This is known as the problem of "dirty hands" rationalized as an ends-justifies-means argument that privileges doing wrong to get the right result.

Whether or not a person uses power to carry out harm may depend on whether or not the individual developed an internal locus of control or governor that helps them distinguish right from wrong, resist societal and authorial pressures to harm others, and take personal responsibility for the consequences of their actions. Others are willing to do anything to achieve desired results including deception, manipulation, using discretion when offering favored contracts to benefit themselves, failing to share credit, and practicing discrimination and/or disrespect. For some, there are no boundaries or societal norms and nothing short of getting caught could serve as an impediment.

Officials who affiliate with public and nonprofit organizations will either take an oath agreeing to uphold moral and ethical standards or share professional ethical prohibitions such as to do no harm. Elected officials or politicians, by contrast, take an oath to uphold the constitution. Those with professional certification may be exposed to codes of conduct that could spill over into their actions as policy makers. Beyond that, the only tools available to build moral awareness, frame moral decision making, clarify moral intent, or encourage moral action have been developed through early socialization such as exposure to caregivers, teachers, religious institutions, the media, and peers. This could be coupled with prior study or life experiences. They have no reason to be concerned about ethical behavior unless they see themselves as persons of integrity who practice openness, accountability, and service. In the best of all scenarios, they would also practice charity. It has been suggested, as shorthand, that individuals may ask themselves three general questions about proposed actions:

1. Is it legal? Am I violating any laws or organizational policies?
2. Is it balanced and fair to all concerned? Is there a possibility that my action or vote can create a win-win situation for all concerned?
3. How will I feel about myself? Will I be proud of what I have done and will I openly tell others what I did?

In democratic settings, this may not be enough because of complexity, chaos, and noise generated in contemporary social settings. The scope and structure of modern politics magnify a bad behavior. The fault line for public officials lies in their representational and organizational capacity. It is

often said that those elected are held to a higher standard and that they need not only avoid ethical infractions but also the appearance of such.

It may be helpful to consider an alternative perception of political ethics. Confucius, for example, cautioned that political figures represent government and must not lose the confidence of the people as this is the foundation of the state. He cautioned that the state will not persist without it. Derelict politics and politicians place the entire society in jeopardy.

Political theorists such as Amoureaux don't accept the theory of "dirty hands" and instead call for the realization that modern life is complex, contingent, and undergoing constant construction and reconstruction as reform and revision. This calls for an ethical reflexivity that allows individuals, organizations, and communities to grow into ethical considerations through interrogation, recognition, and action. Moral beliefs come from successfully negotiating, constructing, and sustaining the rules of a moral community. Abstract principles represent an unsatisfactory basis for establishing an ethical policy. This places the onus on political actors and citizens who need to work to understand the particular circumstances and empathize with the views of others, while acting and observing to see that the results are compatible with ethical goals. Ethical actions are then in a continuous reassessment and adjustment to unfolding circumstances and introspective, self-critical interrogations. The centrality of ethics in a reflexive policy environment encompasses everyone which makes agency or action universal. Ethical actions, as imagined by Foucault, are developed through active interpretation. This engagement with one's own identity calls for listening to others as the activity reaches across cultures and relies on human judgment.

Another alternative guide was developed by Girardin who calls for an ethics that strives for an optimal politics which secures fair treatment of political stakeholders, stresses equity, and fairness and reminds us that the limitation to power, effectiveness, accountability, and justice is essential in politics. He points out that impunity, arbitrariness, and cruelty are destabilizing as they cause regimes to lose support. Ethics in politics is measured by consequences which produce more justice, deeper fairness, more sustainability, and greater responsibility. Constitutions, checks and balances, and an independent judiciary, devolution, delegation, political competition, and mechanisms of accountability need to be in place and enforced. Power unchecked will remove or reduce limitations as it moves toward autocracy and dictatorship. The primary ethical value in politics is justice, interpreted as fairness and reciprocity. There are six values that articulate justice if they are supported with consistency. They include equity, freedom and responsibility, security and peace, unity and diversity, solidarity, and sustainability.

Is there more at stake today? Do we currently face dilemmas that were in the making but did not reach perilous fruition until now? The interests of the planet and of future generations are at stake. Today's globalized world calls for the development of shared values that seek solutions beyond parochial or short-term interests. To Girardin, ethics is at the heart of a constructive tension between global values and global interests. Settling conflicts and shaping compromises into sustainable agreements are premised on finding common ground that elevates the common good for all. Like Amoureaux, Girardin sees the limitations imposed by principles and seeks consistency in consideration, allowing interests, which are under constant evaluation, to converge. Learning from experience and taking corrective measures that foster corrections encourage alertness and seeing questioning as a political advantage. Functional democracies have the elasticity to function while listening to the citizenry.

Girardin seeks the realization of economic limitations and resources as essential reference points if any political agenda is to be realistic. Sound choices need to reflect the true costs of any decisional polices. Ethics in politics is about consistent process and agency which matches values while encouraging the development of associational and stakeholder commitment to the development of shared platforms of values as government leads by setting the agenda, guiding the negotiations, and acting as leader. Trust is built incrementally through respectful processes open to dissent and joint assessment. Politics and ethics are only an

oxymoron if we don't come together and use the tools political theorists like Stone, Girardin, and Amoureaux provide. Ethical politics are possible.

# Politics and Gender

Kendall D. Funk
Texas A&M University, College Station, TX, USA

## Synonyms

Gender expression; Gender identity; Gendered institutions; Gendered leadership; Gendered policy

## Definition

Gender: the behavioral, cultural, or psychological traits typically associated with one sex.

## Introduction: What Is Gender?

What is gender and what does it have to do with politics? Definitions of gender and gender identity have changed drastically over time and continue to be disputed. Traditional conceptualizations define gender as "the state of being male or female." More nuanced definitions suggest that gender is more accurately "the behavioral, cultural, or psychological traits typically associated with one sex" (Merriam-Webster). There is now widespread consensus that gender, like race, is a social construct – meaning that it is an idea that was created through cultural and societal practices, rather than a reality constructed by nature. Gender is distinct from sex, the latter of which refers to one's biological anatomy, such as chromosomes, gonads, reproductive organs, and/or genitalia. One's gender may correspond with one's biological sex (i.e., cisgender) or not (i.e., transgender).

In recent years, there has been a notable societal effort to acknowledge the fluidity of gender and move beyond traditional notions of gender, gender identity, and gender roles. As an example, in 2014, the massive social media company, Facebook, generated an option for users to customize the way they identify their gender, which included expanding their list of gender identities to include over 58 categories and allowing users to select between different gender pronouns, not provide a gender, or keep their gender private. The presence of LGBTQIA (lesbian, gay, bisexual, trans*, queer, intersex, asexual, where trans* refers to multiple identities, such as transsexual, transgender, transvestite, etc.) people in the media and pop culture is also increasing, and gender nonconformity is becoming more accepted among the mass public – though it is still considered unorthodox or taboo by many people. According to a survey conducted by the Pew Research Center in 2015, 55% of Americans support same-sex marriage, with the bulk of this support coming from the Millennial generation or those born after 1980 (70% of whom are in favor) and people unaffiliated with any religion (82% of whom are in favor) (Pew Research Center 2015).

## The Politics of Gender Identity

What does all of this have to do with politics? While gender is indeed a social construct, it is also a *political* one. Governments decide whether to acknowledge certain gender identities, whether to provide rights and protections to various gender groups, or whether to suppress and penalize them. Governments generate and implement policies that affect all gender groups, with some groups benefitting (or suffering) from these policies more than others. While individuals may self-identify their gender(s), governments regulate the extent to which individuals can express and receive official recognition of their gender identity. For example, the United States provides only two gender options for official government documents and proceedings: male or female. Meanwhile, at least seven countries, including Nepal, India, Pakistan, Bangladesh, Germany, New Zealand, and Australia, have made efforts to expand official gender options to include a third category, most commonly denoted as "other," "indeterminate," or "X" gender. These efforts have involved supreme court rulings or national legislation stipulating the addition of a third gender option to certain government records, such as census forms, passports, identification cards, voter registration documents, or birth certificates.

While these efforts signify an advancement for gender minorities and are an important step toward achieving official legal status, there are still shortcomings. Administrative burdens, such as having to request special forms or submit additional paperwork, the absence of additional official gender categories, the failure to separate biological sex from gender, and lack of the option for respondents to write in their self-identified gender, mean that a significant portion of gender minorities will face barriers in their pursuit to attain official recognition of their genders. The vast majority of countries in the world are "genderist," meaning that they acknowledge the existence of only two genders (gender binarism) and assume that the characteristics of one's gender are inherently linked with their biological sex. In genderist institutions, sex and gender are divided into two distinct and opposing categories: masculine, associated with males, men, boys, and masculinity, and feminine, associated with females, women, girls, and femininity. In these countries, individuals who do not identify as entirely male/man or entirely female/woman, such as intersex or trans* individuals, are forced to falsely identify their sex and/or gender in order to receive legal documents and access to government services.

## Gender Rights, Protections, and Prohibitions

In addition to regulating which gender identities receive official legal recognition, governments also determine which rights and protections, if any, will be provided to different gender groups. Many countries have passed laws that protect against sex- or gender-based discrimination in the workplace and protections against hate crimes, though not all of these laws include provisions for gender identity and/or sexual orientation. As of 2015, 21 countries have passed legislation to legalize same-sex marriages, and one country (Mexico) allows same-sex marriages in certain jurisdictions. A number of other countries allow same-sex civil partnerships, registered partnerships, or civil unions, though these partnerships are often denied the same legal rights and privileges as heterosexual marriages. Governments, especially less democratic and nondemocratic ones, are also responsible for generating laws that perpetuate – and even exacerbate – the oppression of women and other gender minorities. Formal legal barriers exist in advanced industrial democracies as well. Same-sex marriage is illegal in most countries, including those considered among the most democratic in the world. In five countries – Iran, Mauritania, Saudi Arabia, Sudan, and Yemen – engaging in same-sex sexual activity is legally punishable by death, and the death penalty is widely implemented in parts of Iraq, Nigeria, and Somalia, despite these countries lacking official laws that stipulate the death penalty for same-sex acts (Carroll and Itaborahy 2015).

Discriminatory laws against women persist in many countries as well, despite the ratification of

the Convention on the Elimination of All Forms of Discrimination Against Women (CEDAW), an international treaty designed to protect the rights of women, by 189 countries around the globe. An *Equality Now* report published in 2015 outlines four areas in which women face discriminatory laws: marital status (marriage, divorce, polygamy, wife obedience), personal status (citizenship, weight of court testimony, travel, prostitution), economic status (inheritance, property, employment), and violence against women (rape, domestic violence, "honor" killings) (Equality Now 2015). Both Egypt and Syria have codified laws that condone "honor" killings – the murder of a woman for engaging in an "illegitimate" sexual act, be it forced or consensual – which protect murderers from being prosecuted to the full extent of the law. Laws in other countries, including the Bahamas, India, Lebanon, Malta, Palestine, Singapore, and Nigeria, protect perpetrators of rape and domestic violence.

Additional punitive laws against women, such as travel constraints, employment limitations, wife obedience laws, forced habitation, divorce restrictions, restrictions on the confer of citizenship to children, forced dress requirements, limitations on property ownership and inheritance, and differential weight of court testimony, are widely prevalent throughout much of the Middle East and Africa and parts of Asia and Latin America. Some notable developed democracies were highlighted by the *Equality Now* report as well. In Japan, women cannot remarry unless 6 months have passed since the dissolution of her previous marriage. The United Kingdom's Equality Act of 2010 allows for discrimination against women in the armed forces. In the United States, citizenship for persons born out of wedlock is tied to the nationality of their biological father (section 309 of the Immigration and Nationality Act). In addition, over 30 US states allow perpetrators of rape to sue their victims for visitation and custody rights for children conceived as a result of forcible insemination (Prewitt 2010). Laws such as these and those that discriminate against LGBTQIA people exacerbate the inequalities that exist between heterosexual, cisgender men and all other gender groups. Moreover, these inequalities are often greater for people of color and those with the worst economic outcomes in life.

## Gendered Politics: Access, Leadership, and Behavior

Gender can be present in all parts of governance, including but not limited to: the elected and non-elected decision-makers who make up governing bodies, the creation and implementation of policy, and the institutions in which policy is developed. Acker (1992: 567) coined the term "gendered institutions" to refer to the presence of gender in "the processes, practices, images and ideologies, and distributions of power in the various sectors of social life." Acker suggests that institutions (e.g., the law, politics, religion, the economy) in many societies are structured along gendered lines. Many important institutions were developed by men, were historically and are currently dominated by men, and are symbolically interpreted as men's domains. These institutions are gendered by nature; however, there is some evidence that the gendered nature of institutions can change once more women (and presumably more LGBTQIA people) are integrated into the institution (Funk and Taylor-Robinson 2014).

Stivers (2002) argues that the very image of leadership is gendered. The traits commonly associated with a leader are tied to masculinity and masculine norms of behavior, such as conflict, competition, aggression, strength, and bravery. If leaders – including men, women, and LGBTQIA people – choose to emphasize leadership traits that diverge from these stereotypically masculine traits, they risk being viewed "as indecisive, soft, and not assertive enough" (Stivers 2002: 72) and may be seen as essentially unfit to be a leader. A large body of literature has researched the gendered patterns of leadership styles and behavior, with much of this literature arguing that women's leadership styles are more democratic, cooperative, inclusive, and participatory. However, there is mixed evidence to support the theory that women's leadership styles and behaviors are significantly different than those of their men counterparts (Eagly and Johnson 1990).

Pathways to power and access to equal treatment and participation in political institutions are fundamentally gendered in most societies as well. Women often have different pathways to power than do men. In democratic countries, factors such as the type of electoral system, structure of the political party system, candidate selection procedures, and incumbency affect levels of women's representation in political institutions. Many countries around the world have taken to unconventional means to overcome these barriers and increase the representation of women in politics through the implementation of gender quotas that force political parties to include a certain percentage of women on their lists of candidates. There is strong evidence that gender quotas are effective in increasing women's representation when enforcement mechanisms and placement mandates exist and that gender quotas are most effective in closed-list proportional representation systems (Tripp and Kang 2008).

Once women attain access to power, there are gendered patterns to the types of positions they receive. For example, in legislatures women are more likely to be assigned to women's issues and social issues committees and generally kept off power committees like economics or foreign affairs (Heath et al. 2005). Additionally, women cabinet ministers are more likely to be given less prestigious and more feminine cabinet portfolios (Krook and O'Brien 2012). Kanter's (1977) work on sex ratios suggests that women are more likely to be equal participants if the gender composition of a group is less skewed and more balanced. This seminal study spawned a huge body of research on "critical mass" theory – the idea that women must obtain a "critical" mass, usually hypothesized to be above 30–40%, before women can act as equal participants. However, few studies have found empirical support for critical mass theory, and more recent research suggests that other factors, such as critical acts or critical actors, are more important for guaranteeing women's equal participation in politics. There is also evidence that women are more likely to come to power under precarious circumstances, such as in times of economic crisis, after a corruption scandal, or following a major party failure, and are more likely to run in elections where they have a small chance of winning (Ryan et al. 2010). This phenomenon has been termed the "glass cliff" by the literature, and women candidates who are recruited to run for precarious positions are often called "sacrificial lambs."

Little to no research has been conducted on gendered pathways to power for LGBTQIA people due to at least three factors: (1) the failure of governments to collect reliable data on LGBTQIA political candidates, (2) hesitation of (would-be) political leaders to openly identify as anything other than a (cisgender, heterosexual) man or woman for fear of negative political repercussions, and (3) the underrepresentation of LGBTQIA people in politics. As the representation of LGBTQIA people increases, research on gendered pathways to power, leadership styles and behaviors, and political assignments should expand to incorporate these other gender groups and determine whether they, like women, face obstacles to equal access, treatment, and participation in politics due to their gender.

## Gendered Policy: Does Representation Matter?

One of the most obvious ways in which politics and gender are intertwined is in the creation of policies that are overtly gendered. Clearly, whether women and LGBTQIA people are treated with equality before the law is a fundamental example of gendered policy. However, policies with gendered implications exist in numerous areas, some of which may seem to be entirely gender neutral. What is considered a women's issue or LGBTQIA issue varies across time and space, so it is difficult to produce a comprehensive list of gendered policy issues. Nevertheless, there are a number of definitions that are able to identify gendered policy issues across contexts. In regard to women's issues, the most minimalist definitions include only issues of women's rights and equality. Broader definitions incorporate issues of children, families, and sometimes welfare, since policies in these areas disproportionately affect women in many societies. The broadest

definitions also include traditionally feminine policy areas, such as education, healthcare, and social services, that correspond to women's traditional roles in society as caregivers and homemakers. However, these broad-based definitions are becoming increasingly obsolete as more men become involved in these traditionally "feminine" policy areas.

Further complicating these definitions of women's issues is the fact that women are an extremely heterogeneous group. Beckwith (2014) distinguishes between women's interests, issues, and preferences as a way to acknowledge that women as a class may share similar interests in various policy issues; however, their preferences about how to address certain issues may differ greatly. For example, all women likely share an interest in protecting their health and well-being. Policy issues related to this interest include healthcare, domestic violence, abortion, and reproductive rights. However, women's preferences about how to address each of these issues vary greatly. Feminist women prefer that abortion is legal in all circumstances, while many religious women prefer that abortion is legal only under certain circumstances (e.g., in cases of rape or when the pregnancy is a threat to the woman's life) or illegal under all circumstances. Both sets of women have a legitimate interest in this policy area and reasons for supporting their preferences, yet they have vastly different ideas about how to best solve the issue. Women constitute roughly half of the world's population, so the idea that women would have congruent preferences on all women's issues is overly simplistic and ill-founded.

Keiser et al. (2002), in their study of the effects of gender representation in the bureaucracy, offer a useful set of criteria for classifying policy areas as gendered. The authors suggest that policy areas can become gendered if (1) the policy directly benefits women as a class, (2) the gender of the bureaucrat changes the relationship between the client and bureaucrat, or (3) the political process defines the issue as a women's issue. In this conceptualization, "elected representative" could easily be substituted for "bureaucrat." In addition, this conceptualization is useful in that it can easily be extended to incorporate all LGBTQIA people. Scholars often forget that the study of gender is not just the study of women, so they neglect to include other gender groups in their studies of gendered policy areas. This critical oversight means that policy areas that affect LGBTQIA people but might not affect (cisgender, heterosexual) women are not being given as much scholarly attention. The LGBTQIA community is interested in issues that also affect cisgender, heterosexual women, such as protections against discrimination and violence, guarantees of equal treatment and compensation in the workforce, provision of equal rights, and access to personalized and quality healthcare. However, they also face unique issues such as whether they can use public facilities (e.g., bathrooms, locker rooms) of their choosing, whether they are provided with adequate services in situations of violence and abuse (e.g., if shelters exist for battered women but not for battered trans* people), and whether they can openly identify as LGBTQIA in military service and public service without being discriminated against.

Policy areas may be gendered even when they appear to be gender neutral or can become gendered through a political event or changes in the policy process. For example, the law regarding alcohol consumption in the United States stipulates that anyone, regardless of gender, above the age of 21 can legally consume alcohol. However, a recent policy recommendation by the Centers for Disease Control and Prevention made alcohol consumption a gendered policy area by recommending that women "stop drinking alcohol if they are trying to get pregnant or could get pregnant" (CDC 2016). This recommendation targeted not only women who are or are trying to become pregnant but also women who could hypothetically get pregnant – no matter their actual probability of becoming pregnant or desires to continue with or terminate a pregnancy if one were to develop. Comparably, increased spread of the Zika virus in 2016, coupled with the discovery of the connection between Zika and microcephaly in newborns, has prompted several nations, including Brazil, Jamaica, El Salvador, Colombia, and Ecuador, to advise women to delay getting

pregnant – up to 2 years in El Salvador – until the virus is better understood. These recommendations are highly gendered and disproportionately burdensome for women who lack access to adequate education, contraceptives, and legal means to abortion. Further, these recommendations do not advise men, who can sexually transmit the disease and impregnate women, to stop having sex or help prevent pregnancies in Zika-affected regions. Additional supposedly gender-neutral policies can have significant implications for various gender groups. Some gender scholars might go so far as to argue that gender is present in all policy areas since gender is such a salient societal division and political identity.

Can the representation of women and gender minorities help to improve gendered politics and policies? In her seminal work *The Concept of Representation*, Pitkin (1967) identifies three types of representation: descriptive, substantive, and symbolic. Descriptive representation involves the mere presence of a certain group in politics. Substantive representation involves the representative acting on behalf of or in the interests of the represented group. Symbolic representation is the response that the represented have to the representative of their group. Research suggests that the descriptive representation of women and LGBTQIA people in political offices and public administration will likely increase the substantive and symbolic representation of the groups they represent. A huge body of research has found that women elected officials are likely to view women as an important constituency, consider themselves representatives of women, and act on behalf of women's substantive interests. There is also a growing literature on representative bureaucracy that finds that gender representation in public administration leads to the substantive representation of women – even in contexts where representation would not be expected (e.g., Keiser et al. 2002). There is no reason why the link between descriptive representation and substantive representation would not exist for LGBTQIA people as well; however, this link has yet to be established empirically due to a lack of sufficient research in this area, the unavailability of reliable data, and the underrepresentation of openly LGBTQIA people in politics and public administration.

Despite widespread evidence that increasing women's representation in politics and the bureaucracy results in positive outcomes for women, women continue to be underrepresented in all aspects of political life. In 2015, UN Women reported that women's representation in national legislatures has doubled over the course of 20 years (from 1995 to 2015). However, this increase resulted in a meager average 22% of national legislators identifying as women. Rwanda is the best performer by far in regards to women's legislative representation, with women occupying 63.8% of seats in the lower house as of 2015. The representation of women in most other countries is abysmal, with women accounting for less than 10% of lower legislative houses in at least 37 states, some countries lacking women political representatives entirely, only 21 countries with women as heads of state or heads of government, and women composing only 17% of government ministers worldwide. These statistics suggest that, despite the gains that have been made, progress for women's representation around the world has been slow and does not seem to be improving much – barring the countries that adopt gender quota laws and reserve seats for women representatives. These extremely low levels of diversity in gender representation signal the need for increased representation of women and other gender minorities in many countries around the world.

## Conclusions

Gender is present in nearly all – if not all – aspects of politics. Gender is political and politics is gendered. Governments play a role in defining the confines of gender identity – at least from a legal perspective – and determine which rights, protections, or limitations will be imposed on various gender groups. Images of political leaders and the ways leaders are expected to behave are gendered. Access to political power, the division of political assignments and responsibilities, and participation in political institutions are gendered as well.

The creation and implementation of public policy certainly have gendered implications. Despite these facts, the overwhelming majority of studies in political science, public administration, and public policy ignore the prevalence of gender throughout almost all political matters and thus fail to capture the importance of gender in studies of political processes and outcomes. The result is that much of what is known about politics and public administration is limited and may not generalize beyond the men who have traditionally dominated these institutions.

Cisgender, heterosexual, elite, white men continue to dominate politics and hold a monopoly on political power, as they have done for hundreds of years in many societies. Increasing gender representation throughout the world is a much-needed step toward achieving better governing systems and political outcomes. Women and LGBTQIA people (in addition to people of color) are largely absent from politics throughout the world, despite the robust finding that increasing the descriptive representation of a group produces improvements in that group's substantive representation. Research on gender and politics continues to grow and improve, but there are still many more questions that need to be answered and much more to be learned. Going forward, researchers and political representatives need to decide whether the bimodal categories for gender (man and woman) are still useful categorizations and whether they should continue to be used. Decisions also need to be made about the extent to which gender should be conceptualized and measured separately from biological sex. In addition, the intersection of various identities (e.g., gender, race, etc.), the nuances of gender identity, and the fluidity of gender (and other) identities should be taken into consideration in future studies and by political decision-makers and representatives.

## Introduction

### Hong Kong's Outstanding Economic Development Legitimated Its Nondemocratic System Before Handover to Mainland China

Hong Kong was a former British colony between 1841 and 1997. Soon after the World War II, given Hong Kong's port, a skilled international trade sector, and extensive shipping links, Hong Kong has accomplished a rapid postwar recovery through entrepot trade and services and acted as a doorway to China. As one of the four renowned Asian tigers, Hong Kong has enjoyed the most spectacular economic development in a single generation via its export-led growth strategy. Between 1960 and 1982, Hong Kong enjoyed an amazing average annual economic growth rate of 7%, which placed it the fifth highest one globally. Between 1980 and 1992, its GDP could still grow at an enviable rate of 6.7% annually (Sing 2009, 2012). Of no less importance, since 1970, Hong Kong has changed its gear, broadening its economic base by its more diversified consumer manufacturing and gradual development into the top three financial center in the world. In 2016, the International Monetary Fund statistics revealed that Hong Kong was ranked 12 in the world in terms of per capita GDP, with US$58,095 in purchasing power parity (Table 1). Besides, Hong Kong has also stood out as a society with an extraordinary degree of global connections. Predicated on the 2012 Globalization Index, which encompasses 60 largest societies by GDP in total, Hong Kong was ranked the top and the most globalized society in the world. The spectacular level of human development of Hong Kong, based on the latest statistics, is shown in Table 1.

Hong Kong's stunning socioeconomic development and globalization has been accompanied by a low level of corruption. The Transparency International, a worldwide agency assessing the perceived levels of corruption around the world, reveals that only 16 out of 175 societies globally are considered as less corrupt as Hong Kong in 2014, putting Hong Kong as the one of the least sullied societies in Asia (Table 2). In short, the spectacular socioeconomic development and overall level of good governance have legitimated the nondemocratic regime of Hong Kong especially before the reversion of its sovereignty from Britain to Mainland China in 1997 (Sing 2010).

That said, the legitimacy or the mass support for Hong Kong's nondemocratic system has visibly faltered, in view of Beijing's increasingly glaring erosion of Hong Kong's freedoms, judicial autonomy, and its widely reported reneging on its promise of allowing Hong Kong to fully democratize especially since 2003.

## Chinese Government Has Repeatedly Blocked Hong Kong's Democratization

Between 1984 and 1997, the British Government has progressively and vigorously pushed for democratic reforms for Hong Kong. During the period, Beijing repeatedly stalled those democratic reforms with implicit and explicit threats, opinion mobilization, and formation of alliances. Immediately after Chinese Government has become the sovereign power over Hong Kong in mid-1997, Beijing reversed some crucial democratic reforms initiated by London and cemented a nondemocratic hybrid regime by dampening

The author is very grateful to the research assistance of Ms. Xing Zhang.

popular participation in the electoral process and changing the electoral system to discourage the ascendancy of the pro-democratic forces. Beijing's maneuvers have debilitated Hong Kong's civil liberties and democracy as measured by the Freedom House (Fig. 1). The Chinese Government has enthusiastically rolled back Hong Kong's partial democracy in order to preclude Hong Kong becoming a subversive base against the one-party rule in China (Sing 2006). At least, Beijing viewed the potential demonstration effect of a fully democratic Hong Kong for the rest of Mainland China with trepidation. Against this backdrop, Beijing, through its anointed chief executive of Hong Kong, attempted blatantly to impose a Draconian anti-subversion law in Hong Kong in 2003. This measure unintendedly deepened the mutual distrust and tension between Beijing and Hong Kong people.

The Draconian national security law eventually sparked off half a million Hongkongers to join a mass demonstration for better governance and greater democracy, the largest protest since the handover of Hong Kong to China. The protest attested to a widespread public rejection of Beijing's ratcheting up of political suppression of Hong Kong and a strong support for greater democracy, in order to safeguard Hongkongers' freedoms, socioeconomic development, and good governance (Sing 2005). Indeed, public opinion surveys toward universal suffrage have shown a fairly consistent mass demand for real democracy.

Public aspirations for democracy have been greeted by deliberate and repeated procrastination of democratization from Beijing since the handover of Hong Kong (Sing and Tang 2012). Since China has become Hong Kong's new master, there was a regression to more authoritarian rule in Hong Kong by dampening popular participation in the electoral process and amending the electoral system to deter the participation of pro-democratic forces in elections. Specifically, the Chinese Government reduced the size of the functional constituencies from over two million to around 200,000 for the elections of the 9 new legislative seats reserved for various professionals. It also installed the proportional representation system for selecting the 20 directly elected seats and made it difficult for pro-democratic

**Politics and Government in Hong Kong, Fig. 1** Ratings of Hong Kong's democracy from 1992 to 2016 (*Source*: Freedom House (1992–2016) Freedom in the World, Hong Kong https://freedomhouse.org/report/freedom-world/2016/hong-kong)

forces to be represented in the legislature (Sing 2009, 298).

With pervasive perception of dwindled freedoms and worsening governance in Hong Kong, amid Beijing's repeated reneging of constitutional promises to implement democracy, Hong Kong's followers of democracy have progressively switched to more aggressive tactics to push for democratization. The escalation in confrontations has coincided with the coming to power of Xi Jinping, a die-hard antagonist to democracy of China. Xi has strengthened Beijing's determination to scupper not only Hong Kong's democratization but also to its freedoms and judicial autonomy.

In June, 2014, Beijing publicized the white paper on "One Country, Two Systems." The Chinese Communist Party asserted, in contravention of Hong Kong's constitution endorsed by Beijing, that Beijing is entitled to interfering with every internal affair of Hong Kong and controlling the nomination of candidates running for Hong Kong's chief executive. What was more, in 2014, the Standing Committee of China's National People's Congress (NPCSC) had suggested Hong Kong should hold a direct popular vote for its chief executive for the first time in 2017, but an effectively pro-Beijing committee would control nominations for the contest. Confronted with Beijing's violation of promise of implementing full democracy in Hong Kong, an occupy movement called Umbrella Movement broke out in 2014 to compel Beijing to concede.

The striking Umbrella Movement in Hong Kong has stunned the world and riveted the global attention. It was notable by its long duration, epic scale of participation, and a drastic turn in movement tactics from the past in this global city. The 79-days-long civil disobedience movement participated by 1.2 million Hong Kong citizens, i.e., nearly 20% of the city's population aged between 15 and 65, signposted the scale of this civil disobedience activity was the largest in Hong Kong's history. The movement was also salient by its

foremost break from the past, when restrained strategies were supplanted by far more provocative acts in the struggle for democracy. The movement has been greeted by many in the world, as many Hong Kong people had the braveries to defy up-front the Chinese Government for democracy. That said, the campaign has hit a stone wall, with Beijing yielding no concession in democratization. What is worse, Beijing and the Beijing-anointed leader of Hong Kong have continued to tighten the screw on Hong Kong's freedoms since late 2014.

## Threats to Freedoms and Judicial Autonomy in Hong Kong Escalated

To obviate another Hong Kong-wide occupy movement, Beijing and its puppet government in Hong Kong have blatantly launched offensives in Hong Kong since the Umbrella Movement to curb Hong Kong's press freedom, academic freedom, freedom of expression, and judicial autonomy.

### Rising Threats to Hong Kong's Press Freedom

Though Hong Kong's constitution upholds freedom of press freedom, the Hong Kong and Chinese Government have stepped up their control over Hong Kong's media (Freedom House 2016).

According to the *Hong Kong Journalists Association (HKJA)'s* 2016 annual report, the erosion in press freedom has been mirrored by the sagging Press Freedom Index. "The 2015 index dropped 0.7 points to 38.2 for journalists and 1.4 points to 47.4 for the general public" (Hong Kong Journalists Association 2016), indicative of a deterioration in press freedom for a second consecutive year. Besides, 85% of journalists, based on a HKJA's research, held that press freedom worsened over the previous year. Likewise, in April 2016, an international NGO concerned with press freedom, i.e., the Reporters Without Borders, detailed Hong Kong's conspicuous fall in press freedom from eighteenth to seventieth between 2002 and 2015. The calculation was based on 43 criteria, including every kind of violation directly affecting journalists (such as murders, imprisonment, physical attacks, and threats) and news media (such as censorship, confiscation of issues, searches, and harassment). The dire warnings from the HKJA and Reporters Without Borders were echoed in January 2016 by the International Federation of Journalists. When the Federation released its annual China Press Freedom Report, it underscored that the "press freedom in China, Hong Kong and Macau deteriorated further in 2015, as the Communist Party of China used every means at its disposal to control the media." The report also forewarned that "As Hong Kong goes to elections . . . the party is also using its considerable wealth to consolidate its influence in the region" (UK Foreign & Commonwealth Office 12 October 2016). To explain the decline in Hong Kong's press freedom, the worsening self-censorship amid the suppression from the political establishment, and the increasing ownership of Hong Kong's media from Mainland's capital, have been obviously important causes.

As argued by the HKJA in 2015, journalists in Hong Kong were confronted with both external and internal pressures. Journalists were besieged with the "internal pressure in the form of escalating self-censorship in order to comply with establishment viewpoints" (UK Foreign & Commonwealth Office 11 February 2016). Most journalists regarded self-censorship as very common, particularly regarding stories criticizing the Beijing Government, so as to avoid currying trouble from Beijing (Africa Leader 24 March 2016; Reporters Without Borders 10 October 2014). One case in point has been that in April 2016, a dominant middle-class newspaper of Ming Pao sacked its executive chief editor, shortly after his insistence of releasing an in-depth report detailing the secretive investments and deposits of Mainland's leaders in offshore banks. "Many were skeptical about Ming Pao's public explanation that the decision to sack the senior executive was simply 'cost saving'" (UK Foreign & Commonwealth Office 12 October 2016).

HKJA also highlighted that "71 percent of journalists believed the Hong Kong Special Administrative Region (HKSAR) Government contributed to the suppression of press freedom" (UK Foreign & Commonwealth Office

11 February 2016). HKJA condemned the HKSAR Government's increasing practice of making major announcements through blogs and other "one-way" form of communication rather than holding press conferences. The HKJA called on the government to raise transparency by enacting freedom of information and archive laws, only to be ignored by the government. Indeed, 89% of journalists agreed in a survey in 2014 that a law on freedom of information should be enacted. Journalists surveyed in early 2016 thought they faced obvious and increasing difficulties in obtaining information vis-à-vis a year before (Hong Kong Journalists Association 2016). Concerns were also raised by some commentators that the pro-Beijing chief executive has restricted information on government officials' visits to Beijing and refused to hold press conferences or only invited camera operators and photographers in order to avoid question-and-answer sessions (Reporters Without Borders 10 October 2014).

Physical attacks on journalists can be tantamount to trampling on press freedom, especially if they happen mostly on liberal media. Despite the decline in the number of physical attacks on journalists between July 2015 and June 2016, they have been worsening in the last few years (Hong Kong Journalists Association 2016). To illustrate, during the 2014 Umbrella Movement protests, more than 30 journalists were assaulted. Attackers on journalists were mostly released or only had a minor punishment subsequently. In January 2015, the harshest critic on the government and the most liberal media company – the Next Media – had its headquarters and its founder's home targeted in firebomb attacks soon perhaps for their support of Hong Kong's pro-democracy movement (Freedom House 2016; Hong Kong Journalists Association 2016). Meanwhile, "the attitude of Hong Kong police toward media and journalists has been hardening in recent years" (Reporters Without Borders 10 October 2014). Arrests of journalists and police misconduct toward journalists during demonstrations have become more frequent.

Since the ascendancy to power of Xi Jinping in March 2013, there has been a visible trend toward escalating media control in Mainland. Arguably, the decline in Hong Kong's press freedom has mirrored the tightening ideological and organizational control from Beijing.

As underlined in *the HKJA's 2013 annual report*, China has endeavored to regain the Hong Kong media since the crackdown of Tiananmen Square movement in 1989. The policy aims at ensuring the territory's media would become the Chinese Government's mouthpieces. Beijing's policy has achieved a success as the Chinese Government or Mainland corporations now have direct control or stakes in 8 out of 26, i.e., 31% of mainstream media outlets in Hong Kong. "These are Ta Kung Pao, Wen Wei Po, Hong Kong Commercial Daily, China Daily's Hong Kong edition, Sing Pao Daily News, Phoenix Satellite Television, TVB and most recently the South China Morning Post, which came under the control of Chinese internet entrepreneur Jack Ma and his Alibaba group in April 2016" (Hong Kong Journalists Association 2016).

### Escalating Threats to Academic Freedom

Academic freedom has also taken a hit during recent years. University professors in Hong Kong have been generally able to write and lecture freely, and political debates on campuses were lively. In the aftermath of the Umbrella Movement, however, concerns began to surface that political pressure was being applied to Hong Kong's universities, in particular over appointments and general policy. In January 2015, Chen Zuo'er, former Deputy Director of the Hong Kong and Macao Affairs Office of the State Council (HKMAO), said at a forum in Beijing that it was "clear there are problems with the education in Hong Kong along with its development" and that "the 'national interest' must be considered when Hong Kong considered its education policy" (UK Foreign & Commonwealth Office 21 July 2015).

A string of incidents in the last 2 years have raised concerns that Beijing is putting greater pressure on Hong Kong's academic circle. In April 2015, the City University of Hong Kong abruptly closed its creative writing program, whose students had published a number of

works supportive of the Umbrella Movement. In September 2015, "the governing Council of the University of Hong Kong rejected a nominee for the post of pro-vice-chancellor, Johannes Chan, who had been unanimously approved by the search committee. The majority of the council members were neither students nor university employees – six were appointed directly by the Hong Kong's Chief Executive. Chan's supporters said that his background as a human rights lawyer and prodemocracy scholar made him unpalatable to Beijing" (Freedom House 2016). In December 2015, despite a series of protests, Chief Executive Leung appointed a pro-Beijing scholar, Arthur Li, as the chairman of the governing council of the University of Hong Kong (Freedom House 2016).

Moreover, a liberal and famous academic, Joseph Cheng Yu-shek, a professor of political science at the City University of Hong Kong, also alleged that the pressures on and job insecurity of young academics have incentivized them to be "politically correct" (Denyer 2015). He found the presence of political pressure to adopt a pro-Beijing line among the faculty members if they aspired for promotion. Concomitantly, Beijing encourage loyal academics by granting them valuable honors and posts at Mainland universities and discourage disloyal academics with denial of their access to Mainland to conduct research (Denyer 2015). Likewise, a scholar who joint in 2014 Umbrella Movement underscored that the tendency toward tighter control was quite obvious, as the whole system delivered a crystal clear message that academics "should keep silent and focus on their research" (Denyer 2015). That said, confronted with the erosion of academic freedom, hundreds of scholars signed a petition letter in March 2015 to voice their concerns about "political intervention" in the territory's universities and a serious threat to academic freedom (Denyer 2015).

Moreover, in 2012, Hong Kong experienced a large-scale public movement protesting the implementation of national education. The movement was significant as it was both successful and broad based, being against Beijing's attempt to limit students' freedom of thought and renege on its promise of granting Hong Kong "high degree of autonomy" under the "One Country, Two Systems" framework. In January 2015 Hong Kong's chief executive stressed that the government would amend the current high school curriculum to deepen students' interest in and understanding of Chinese history and culture (Steger 2015). Many media reports purported the government was intent on a major policy shift to brainwash students in order to avert another large-scale democracy or occupy movement if students continued to be exposed to liberal and critical ideas including those found in the subject of liberal studies. Pro-Beijing politicians have repeatedly sounded out warnings to water down the subject of liberal studies (Steger 2015). In addition, the Chief Executive underlined that the government would subsidize students to participate in exchange programs with schools in Mainland, but not elsewhere (Denyer 2015). The obvious attempt for Beijing to control the academic freedom and freedom of thought in Hong Kong already backfired on Beijing in a number of resistance movements since 2012.

### Threats to Freedom of Expression

Beijing Government's growing interference with Hong Kong's human rights can also be gleaned from the erosion of Hong Kong's freedom of expression. One notorious and internationally reported case concerned five missing booksellers, who published and distributed books critical of the Chinese Government in Hong Kong, especially for Mainland's tourists. They were all later held in detention in Mainland China (Hong Kong Journalists Association 2016).

Among them, Lam Wing-kee returned to Hong Kong on 14 June 2016, 8 months after his vanishing. Two days afterward, Lam held a press conference, divulging to the press that he and other booksellers had been kept in custody involuntarily by Mainland agents, denied due process, interrogated, required to sign nondisclosure documents, and compelled to make untrue statements. Lam said that he had chosen to risk his own and his family's safety by speaking out because "this isn't just something which involves me, but implicates the whole of Hong Kong society" (UK Foreign & Commonwealth Office

12 October 2016). Lam's press conference raised grave concern and serious doubt about Beijing's sincerity to grant Hong Kong high degree of autonomy and have its freedoms remained intact as promised in Hong Kong's constitution. The saga dominated media coverage over the following days, with many arguing that Lam's revelations showed that rights and freedoms guaranteed by the Basic Law had been undermined (UK Foreign & Commonwealth Office 12 October 2016).

The case of five missing booksellers and the effort by Beijing to quash the publication of critical books have been emblematic of the deterioration in freedoms in Mainland and Hong Kong on the heels of an ideological crackdown in Mainland China triggered by President Xi Jinping. The event has created negative impact on freedom of expression and press freedom in Hong Kong (Hong Kong Journalists Association 2016). The descent in freedom of expression also appeared in the entertainment industry.

On 6 June 2016, it was reported that Lancôme called off an impending concert it had sponsored by a prominent pro-democracy Canto-pop star Denise Ho. Though Lancôme mentioned "possible safety concerns" as the ground for cancellation, the decision came only days after Mainland state-owned media denigrated Ho for her pro-democracy stance and for having met the Dalai Lama. Ho contended "If we were in a free society, a civilized society, political pressure shouldn't cross the border to affect business decisions." This event has prompted widespread anger and concerns for freedom of expression (UK Foreign & Commonwealth Office 12 October 2016).

Of no less importance, in February 2016, the Mainland media banned the broadcast of the Hong Kong Film Awards (held in April) after the film *Ten Years* was nominated as a candidate for the Best Film Award (UK Foreign & Commonwealth Office 12 October 2016). This film, which sought to depict Hong Kong in 2025, portrayed Hong Kong as an authoritarian institution with a bleak future under Beijing's stringent control. It has attracted much more audience and many more screenings in Hong Kong than expected, despite its minuscule budget. "While the 'Ten Years' is a hit, Hong Kong cinema operators quietly dropped it after state media criticized the film" (Radio Free Asia 2016). Many pro-Beijing investors and professionals in film industry also denigrated value of the film. The Hong Kong Film Awards Association acknowledged that after the nomination of the movie, both China Central Television (CCTV) and Chinese Internet broadcaster Tencent had decided not to broadcast the ceremony. This has happened despite that the movie was crowned "Best Film" and has played at cinemas overseas.

## Judicial Autonomy

Justice Kemal Bokhary, a Nonpermanent Judge of Hong Kong's Court of Final Appeal, elucidated a fundamental challenge faced by courts of the global city in April, 2016 – their onus to make the "One Country, Two Systems" principle work (UK Foreign & Commonwealth Office 12 October 2016). Since the handover of Hong Kong, threats of China to its rule of law have surfaced. In 2014, for instance, the White Paper issued by the Chinese Government in June deemed that Hong Kong officials, including judges, should love the country as the basic political requirement. "Many jurists saw it as a demand for loyalty to Beijing and a threat to the territory's rule of law and judicial impartiality" (Freedom House 2016).

Noticeably, one major source of threat to Hong Kong's judicial autonomy and rule of law lies in the legal right of China's National People's Congress to make final interpretations of the Basic Law. This right curtails the power of Hong Kong's Court of Final Appeal to maintain political rights and rule of law. China's recent decision to reinterpret the Basic Law in late 2016 is a case in point.

In November 2016 the Standing Committee of the National People's Congress (NPCSC) in Beijing reinterpreted Article 104 of the Basic Law, demanding Hong Kong's elected legislators, on taking the oath of office in Hong Kong, to do so "sincerely and solemnly" (Williams 2016). Anyone who includes sarcasm or implies insincerity in their oath will be excluded from becoming a legislator and cannot retake the oath. Following the reinterpretation, on 15 November 2016, Hong Kong High Court ruled against two pro-

independence elected legislators, formally barring them from taking up their seats in the legislature. Besides, four more pro-democracy legislators were sued by the HKSAR government for the purported refusal to take the oath properly.

This latest interpretation of the Basic Law, the fifth one already since the reversion of Hong Kong's sovereignty, has fueled extensive apprehensions that China is tightening its control over Hong Kong and thereby sparking a series of protests in the city.

Critics contended that the fifth interpretation of the Basic Law attempts to preclude the pro-independence legislators getting a foothold in the local government (Williams 2016) and to silence democratic voices. And it casts a pall on China's willingness to reinterpret Hong Kong's constitution for its own benefit (New York Times 09 November 2016). In response, on 8 November 2016, over 1000 lawyers marched silently through Hong Kong to berate China and support two elected and disqualified lawmakers (New York Times 09 November 2016). Lawyers warned that the latest interpretation would undercut the city's judicial independence and spell the death knell for Hong Kong's rule of law (Hong Kong Free Press 09 November 2016).

## Hong Kong's Vital Importance for China Helps Maintain "One Country, Two Systems"

As indicated in Fig. 1, despite the glaring erosion of freedoms in Hong Kong over the last few years, its overall level of civil liberties and political rights still patently outperforms those in Mainland. As argued below, Hong Kong still possesses some strategic and irreplaceable economic advantages over Mainland that have induced Beijing to maintain the limited freedoms and judicial autonomy in Hong Kong to date.

Despite the sagging proportion of Hong Kong's GDP out of China's one, the International Financial Centre of Hong Kong remains indispensable to China for several reasons. First, as Hong Kong has outperformed any other Mainland city in terms of its fair, transparent courts and long-established tradition of rule of law, Hong Kong has become the greatest center for equity financing in China. For example, between 2012 and late 2014, "Chinese companies have raised $43 billion in initial public offerings in the Hong Kong market, versus just $25 billion on mainland exchanges. More than anywhere else in the world, Hong Kong has also provided Chinese companies with access to global capital markets for bond and loan financing (Economist 2014)." What is more, Hong Kong is the key hub for investment in and out of China. It accounted for two-thirds of foreign direct investment into China last year, up from 30% in 2005 (Economist 2014). Also, given the resources in Hong Kong, it has become a testing ground for a range of financial reforms for the Chinese Government. In short, China has benefited greatly from the global city of Hong Kong, which is detached from the Mainland but closely associated with it; a territory that is fully integrated into the global economy but eventually controlled by Beijing (Economist 2014). Therefore, if China were to take away Hong Kong's freedoms and rule of law, or jettison "One Country, Two Systems" entirely, China would have to pay a heavy price. This is especially so, given Hong Kong's outstanding and stable record in terms of global competitiveness.

Hong Kong's competitiveness was ranked for the fifth consecutive year in the top 10 of famous Global Competitiveness Index (GCI). The latest 2016–2017 measurement shows that Hong Kong was ranked the ninth in terms of GCI having achieved a strong and consistent performance. "HKSAR features in the top 10 of seven criteria of the GCI. Hong Kong tops the infrastructure pillar for the seventh time, reflecting the outstanding quality of its facilities in various modes of transportation. Its financial sector (4th) is very well developed, highly sophisticated, trustworthy, and stable. Its labor market is among the world's most flexible and efficient (3rd worldwide). Finally, Hong Kong is hyper-connected and it boasts some of the highest rates of Internet use and mobile telephony penetration" (Schwab 2016). The GCI results reveal that Hong Kong, Japan, and Singapore are the only Asian societies within the top 10 in the GCI for 2016–2017. The

structural advantages of Hong Kong over China and the subsequent strategic economic importance of Hong Kong for China can raise the bargaining power of Hong Kong to maintain freedoms and rule of law promised under the rubric of "One Country, Two Systems." That said, there are increasing signs that Beijing has endeavored to deepen economic dependence of Hong Kong and China so as to tighten its political control over the global city.

## Prospect of Hong Kong: Greater Sino-Hong Kong Economic Integration Deepens Political and Economic Threats to Hong Kong

The rising economic integration of Mainland and Hong Kong economy has increasingly raised the threats to Hong Kong's political stability and economic prosperity, owing to the increasingly palpable financial and economic weaknesses in Mainland, and the political suppression from Beijing on Hong Kong. Based on the International Monetary Fund, at least as of 2012, the American economy overrode the Chinese one in terms of the size of economic impact on Hong Kong's business cycle (Economist 2015). However, the sharp increase of Mainland's investment in Hong Kong over the years has enormously integrated Hong Kong's economy into Mainland's one (Economist 2015).

Nearly 40% of Hong Kong's foreign direct investment in 2015 came from Mainland, which rose from about 10% in the late 1990s (Economist 2015). Also, in 2015, 43.6% of Hong Kong's exports of domestically produced goods, and 53.8% of its re-exports were shipped to China. In addition, in 2016, 77.3% of tourist arrivals were from China, up from 63% 5 years ago (Moody 2016). The quantity of Mainland visitors to Hong Kong surged more than 10 times from 4.4 million in 2001 to 47 million in 2014, taking up more than 75% of all foreign arrivals (Economist 2015).

The rising economic integration between Mainland and Hong Kong has been further boosted by that since late 2014; Shanghai provided access to any foreigner with a Hong Kong brokerage account to its closely safeguarded stock market. In 2015, Mainland also allowed the sale of mutual funds domiciled on its side or in Hong Kong to be sold in each other's markets, strengthening Hong Kong's asset management industry. Beijing has also reinforced Hong Kong as the pivotal offshore center for trading the yuan, making it the most important place to internationalize yuan. That said, further integration between Mainland and Hong Kong will likely pose greater threat to Hong Kong's political stability and economic prosperity.

## Conclusion: Further Integration Between Mainland and Hong Kong Harmful to Hong Kong's Stability and Prosperity

In March 2016, one of the leading international rating agencies, i.e., Moody's Investors Service, affirmed the rating outlook of Hong Kong was downgraded to negative from stable. The downgrade reflects Moody's analysis that Hong Kong's deepening political, economic, and financial linkages with the Mainland would jeopardize Hong Kong's economy and stability (Moody 2016). Likewise, another renowned rating agency Standard and Poor also cut the credit rating for Hong Kong from stable to negative in 2016, which cited the increasing economic and financial risks to the Mainland government's creditworthiness (CNBC 2016).

Beijing's incessant attempts to block Hong Kong's democratization, suppress its freedoms, and weaken its judicial autonomy have triggered the radicalization of street politics, the outbreak of Umbrella Movement, the unfolding of a pro-independence movement, and the sharply rising confrontations against Mainland. As argued by Moody (2016), over the medium term, the strong political linkage embedded in June 2014 White Paper from China's State Council – "creates the risk that Hong Kong's institutions will lose some of their independence over time as China's influence grows. This would negatively affect policy

effectiveness and credibility in Hong Kong and weaken its institutional strength relative to China's."

On the other hand, the deepening financial and economic malaises in Mainland, amid the growing significance of China for Hong Kong's trade, entail that any further economic trouble in China would considerably stifle Hong Kong's economic performance, both directly through bilateral trade channels and indirectly through China's bearing on global trade (Moody 2016). Noticeably, other than economic linkages, Hong Kong's banking sector is also exposed to China. During the third quarter of 2015, the total bank lending from Hong Kong to the Mainland took up 15.7% of total assets. Hong Kong's banks credit risk would therefore escalate if loan books' exposure to Chinese corporations continues to mount (Moody 2016).

Based on a gauge of the Bank for International Settlements, China's credit-to-GDP gap stood at an exceptionally high level of 30.1% in November 2016, scoring the largest figure among all countries since the use of this statistics in 1995 (Panckhurst and Leung 2016). The credit-to-GDP gap shows the scale of credit boom and the risk of trouble brewing. Based on the Bank's analysis, the credit-to-GDP gap is the single most reliable indicator of looming financial crises. The Bank found in a 2011 analysis of 36 countries that a majority of banking crises followed readings higher than 10% (Panckhurst and Leung 2016). The dire warning from the Bank of International Settlements about the looming economic crisis of China was echoed by the celebrated Nobel Prize Laureate, the economist Paul Krugman, who said that "China in 2016 looks a lot like Japan in 1989 – right before Tokyo headed into a prolonged period of financial crisis known as the 'lost decade'" (Liu 2016).

In short, should Mainland encounter major economic woes, not only will it spell severe economic distress for Hong Kong but it may also usher in more political upheavals for Hong Kong. The erosion of Hong Kong's freedoms and judicial autonomy bred under an increasingly authoritarian government within a nondemocratic structure has progressively delegitimized both the HKSAR and Beijing Government. Further economic integration of Mainland China and Hong Kong can unleash colossal economic and political cost for Hong Kong, should China's economy run into big distress.

# Politics and Partisanship

Grant Ferguson
Department of Political Science, Texas Christian University, Fort Worth, TX, USA

## Synonyms

Party ID; Party identification

## Definition

Partisanship: The identification of an individual with a political party.

## Introduction

Partisanship is one of the most important aspects of American politics. It has been somewhat accurately called the "unmoved mover," because it influences everything in the political world, while it itself changes slowly and rarely. This chapter describes the meaning of partisanship for American politics, beginning with the origin and function of parties in the US political system and ending with how partisanship affects political behavior. The chapter also includes some meaningful comparisons to partisanship in a comparative context.

## Where Do Parties Come from?

The American Founders disliked parties. Prior to the adoption of the Constitution, James Madison warned of the "mischief of factions" in Federalist 10. In his Farewell Address, George Washington cautioned against their effects. So why did parties arise, if both the chief designer of the Constitution and influential first president disliked them?

The Constitution created a Congress without parties. However, legislatures without parties face a tremendous **coordination issue**. Coordination issues occur when a group of people all have

similar preferences about a group of potential outcomes, but a mutually preferred outcome will not be achieved unless they are able to share information and bear the costs of organizing. Imagine being a legislator in the early American Congress who favors the creation of a national bank. You want to write a bill creating a bank but don't know what other legislators favor one. You also don't know who has expertise in finance and could help you write such a bill. In a legislature with almost 100 members, this creates a real challenge to your ability to pass a bill creating a national bank. Without parties, the coordination issue you face may prevent you from passing a bank bill. A similar coordination issue occurs in legislatures around the world.

Parties solve this problem. By mobilizing a group of legislators into a party, members of Congress could easily organize around particular policy positions and appoint administrative leaders to increase their ability and efficiency to pass legislation. By the end of Washington's second term, two parties had formed, the Federalists and the Democratic-Republicans.

## The Origins and Development of Mass Partisanship in American Politics

Parties arise to satisfy the legislative need to pass policies. It's not surprising, therefore, that American parties first organized themselves around differences in which policies should be passed. Policy preferences about the proper role of government in society, or **ideology**, are a common organizing principle of parties around the world. Personalist parties, or those organized around support of a particular politician or family, sometimes compete with ideological parties. In American politics, however, explicitly or effectively personalist (like Theodore Roosevelt's Bull Moose Party) parties are rare and short-lived.

Following George Washington's retirement after two terms, the policy-oriented Federalist and Democratic-Republican parties faced the challenge of getting a new president elected who fit their policy preferences. They adapted to do so and exhibited the second purpose of parties in American politics. If the first purpose was to get preferred policies passed, the second purpose was to get candidates elected who would further ease the passage of preferred policies. To do this, they eventually had to create national, state, and local party organizations.

With the end of the Era of Good Feelings in 1824, the rise of the Whig Party to challenge the Democrats, and the gradual development of universal free manhood suffrage, the development of these party organizations adapted to mobilize and turn out massive coalitions of partisan voters. For much of the nineteenth century and early twentieth century, the parties encouraged turnout among their loyal voters with promises of patronage jobs and spoils from victory. The parties nevertheless mobilized their supporters around important political issues and appeals to group identity, and continue to do so today.

## Why Are There Two Parties in American Politics?
